It is also in the field of communications, as in so many other fields, that Americans are blessed. We have the freedom to communicate, without restraint, on any subject. This has made for better lawyers, better engineers, and, most assuredly, better physicians. Communications are part of the total picture of America's medical muscle. The Mercer County journal is an example. I cannot understand a third of the big words in the articles, but the physicians can, and my doctor friends and relatives tell me this journal is doing an excellent job for Mercer County medicine.

That is as it should be. I would hope, however, that this publication—and scores of other scientific and lay publications—can help the public better understand the price that young people pay in sweat and headaches (and dollars) to become physicians, and the price that doctors, of any age, pay in stress and fatigue to render adequate service to the men, women, and children of this nation.

Americans are blessed from their toenails to their scalps with the finest physicians in the world, but they are not aware of it and they need to be told.

THEO-DUR[®]
(theophylline anhydrous) Sustained
Action
Tablets

**There's no substitute
for success.**

Please see following page for brief summary of prescribing information.

THEO-DUR®

THEOPHYLLINE (Anhydrous)

Sustained Action Tablets

INDICATIONS: THEO-DUR is indicated for relief and/or prevention of symptoms of asthma and for reversible bronchospasm associated with chronic bronchitis and emphysema.

CONTRAINDICATIONS: THEO-DUR is contraindicated in individuals who have shown hypersensitivity to theophylline or any of the tablet components.

WARNINGS: Status asthmaticus should be considered a medical emergency and is defined as that degree of bronchospasm which is not rapidly responsive to usual doses of conventional bronchodilators. Optimal therapy for such patients frequently requires both *additional medication*, parenterally administered, and *close monitoring*, preferably in an intensive care setting.

Although increasing the dose of theophylline may bring about relief, such treatment may be associated with toxicity. The likelihood of such toxicity developing increases significantly when the serum theophylline concentration exceeds 20 mcg/ml. Therefore, determination of serum theophylline levels is recommended to assure maximal benefit without excessive risk.

Serum levels above 20 mcg/ml are rarely found after appropriate administration of recommended doses. However, in individuals in whom theophylline plasma clearance is reduced for any reason, even conventional doses may result in increased serum levels and potential toxicity. Reduced theophylline clearance has been documented in the following readily identifiable groups: 1) patients with impaired renal or liver function; 2) patients over 55 years of age, particularly males and those with chronic lung disease; 3) those with cardiac failure from any cause; 4) neonates; and 5) those patients taking certain drugs (macrolide antibiotics and cimetidine). Decreased clearance of theophylline may be associated with either influenza immunization or active infection with influenza.

Reduction of dosage and laboratory monitoring is especially appropriate in the above individuals. Less serious signs of theophylline toxicity (i.e. nausea and restlessness) may occur frequently when initiating therapy, but are usually transient, when such signs are persistent during maintenance therapy, they are often associated with serum concentrations above 20 mcg/ml. Unfortunately, however, serious side effects such as ventricular arrhythmias, convulsions or even death may appear as the first sign of toxicity without any previous warning. Stated differently: *serious toxicity is not reliably preceded by less severe side effects.*

Many patients who require theophylline may exhibit tachycardia due to their underlying disease process so that the cause/effect relationship to elevated serum theophylline concentrations may not be appreciated.

Theophylline products may cause dysrhythmia and/or worsen pre-existing arrhythmias and any significant change in rate and/or rhythm warrants monitoring and further investigation.

The occurrence of arrhythmias and sudden death (with histological evidence of necrosis of the myocardium) has been recorded in laboratory animals (minipigs, rodents and dogs) when theophylline and beta agonists were administered concomitantly, although not when either was administered alone. The significance of these findings when applied to human usage is currently unknown.

PRECAUTIONS: THEO-DUR TABLETS SHOULD NOT BE CHEWED OR CRUSHED.

General: Theophylline half-life is shorter in smokers than in non-smokers. Therefore, smokers may require larger or more frequent doses. Morphine and curare should be used with caution in patients with airway obstruction as they may suppress respiration and stimulate histamine release. Alternative drugs should be used when possible. Theophylline should not be administered concurrently with other xanthine medications. Use with caution in patients with severe cardiac disease, severe hypoxemia, hypertension, hyperthyroidism, acute myocardial injury, cor pulmonale, congestive heart failure, liver disease, in the elderly (especially males) and in neonates. In particular, great caution should be used in neonates with theophylline to patients with congestive heart failure. Frequently, such patients have markedly prolonged theophylline serum levels with theophylline persisting in serum for long periods following discontinuation of the drug. Individuals who are rapid metabolizers of theophylline, such as the young, smokers, and some non-smoking adults, may not be suitable candidates for once-daily dosing. These individuals will generally need to be dosed at 12 hour or sometimes 8 hour intervals. Such patients may exhibit symptoms of bronchospasm near the end of a dosing interval, or may have wider peak-to-trough differences than desired.

Use theophylline cautiously in patients with history of peptic ulcer. Theophylline may occasionally act as a local irritant to the G.I. tract although gastrointestinal symptoms are more commonly centrally mediated and associated with serum drug concentrations over 20 mcg/ml.

Information for Patients: The physician should reinforce the importance of taking only the prescribed dose and time interval between doses. THEO-DUR tablets should not be chewed or crushed. When dosing THEO-DUR on a once daily (q24h) basis, tablets should be taken whole and not split. As with any controlled-release theophylline product, the patient should alert the physician if symptoms occur repeatedly, especially near the end of the dosing interval.

DRUG INTERACTIONS: Drug-Drug: Toxic synergism with ephedrine has been documented and may occur with some other sympathomimetic bronchodilators. In addition, the following drug interactions have been demonstrated:

Drug	Effect
Theophylline with lithium carbonate	Increased excretion of lithium carbonate
Theophylline with propranolol	Antagonism of propranolol effect
Theophylline with cimetidine	Increased theophylline blood levels
Theophylline with troleandomycin, erythromycin	Increased theophylline blood levels

Drug-Food: THEO-DUR 100 mg Sustained Action Tablets have not been adequately studied to determine whether their bioavailability is altered when given with food. Available data suggest that drug administration at the time of food ingestion may influence the absorption characteristics of theophylline controlled-release products resulting in serum values different from those found after administration in the fasting state.

A drug-food effect, if any, would likely have its greatest clinical significance when high theophylline serum levels are being maintained and/or when large single doses (greater than 13 mg/kg or 900 mg) of a controlled-release theophylline product are given.

THEO-DUR (200, 300, and 450 mg) Sustained Action Tablets: The rate and extent of absorption of theophylline from THEO-DUR 200 mg, 300 mg, and 450 mg tablets when administered fasting or immediately after a moderately high fat content breakfast is similar.

Drug-Laboratory Test Interactions: When plasma levels of theophylline are measured by spectrophotometric methods, coffee, tea, cola beverages, chocolate, and acetaminophen contribute falsely high values.

Carcinogenesis, Mutagenesis, and Impairment of Fertility: Long-term animal studies have not been performed to evaluate the carcinogenic potential, mutagenic potential, or the effect on fertility of xanthine compounds.

Pregnancy: Category C—Animal reproduction studies have not been conducted with theophylline. It is not known whether theophylline can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Xanthines should be given to a pregnant woman only if clearly needed.

Nursing Mothers: It has been reported that theophylline distributes readily into breast milk and may cause adverse effects in the infant. Caution must be used if prescribing xanthine to a mother who is nursing, taking into account the risk-benefit of this therapy.

Pediatric Use: Safety and effectiveness of THEO-DUR administered:

1. Every 24 hours in children under 12 years of age, have not been established
2. Every 12 hours in children under 6 years of age, have not been established.

ADVERSE REACTIONS: The most consistent adverse reactions are usually due to overdose and are:

1. **Gastrointestinal:** nausea, vomiting, epigastric pain, hemeatemesis, diarrhea.
2. **Central nervous system:** headaches, irritability, restlessness, insomnia, reflex hyperexcitability, muscle twitching, clonic and tonic generalized convulsions.
3. **Cardiovascular:** palpitation, tachycardia, extrasystoles, flushing, hypotension, circulatory failure, ventricular arrhythmias.

4. **Respiratory:** tachypnea

5. **Renal:** albuminuria, increased excretion of renal tubular and red blood cells, potentiation of diuresis.

6. **Other:** rash, hyperglycemia and inappropriate ADH syndrome.

OVERDOSEAGE: Management: If potential oral overdose is established and seizure has not occurred:

- A. Induce vomiting.
 - B. Administer a cathartic (this is particularly important if sustained-release preparations have been taken).
 - C. Administer activated charcoal.
- If patient is having a seizure:
- A. Establish an airway.
 - B. Administer oxygen.
 - C. Treat the seizure with intravenous diazepam, 0.1 to 0.3 mg/kg up to 10 mg.
 - D. Monitor vital signs, maintain blood pressure and provide adequate hydration.

Post Seizure Care:

- A. Maintain airway and oxygenation.
- B. If a result of oral medication, follow above recommendations to prevent absorption of the drug, but intubation and lavage will have to be performed instead of inducing emesis, and the cathartic and charcoal will need to be introduced via a large bore gastric lavage tube.
- C. Continue to provide full supportive care and adequate hydration while waiting for drug to be metabolized. In general, the drug is metabolized sufficiently rapid so as not to warrant consideration of dialysis, however, if serum levels exceed 50 mcg/ml charcoal hemoperfusion may be indicated.

CAUTION: Federal law prohibits dispensing without prescription. For full prescribing information, see package insert. Revised 6/87

Time...

Endorsed by
Medical Society of New Jersey

The old adage "there never seems to be enough time" is probably truer for physicians than anyone. And of course, the busier you are with your practice, the less time you have to spend on your investments.

That's where AMA Advisers comes in! We are the investment organization working for you. AMA Advisers, Inc. is a subsidiary of the American Medical Association and we have your investment interests in mind.

AMA Advisers has the time...and the money management expertise to manage a full array of mutual funds in The AMA Group. We provide a variety of alternative investment choices that can be tailored to your specific needs.

Building Mutual Trust

AMA ADVISERS, INC.

AMA Advisers, Inc. is a subsidiary of the American Medical Association and manages the mutual funds in The AMA Group.

Plus, we offer a broad range of investor services, and, of course, overall professional management of the highest quality.

Why not spend some time right now to find out how AMA Advisers can help you. Simply complete and mail the coupon for your **FREE** Information Kit on the funds in The AMA Group. We'll send you prospectuses with more complete information detailing fees and expenses. Please read the prospectuses carefully before you invest or send money.

Services and products as described herein are not offered for sale in any state where they are not lawfully registered.

**FOR FASTER ACTION, CALL TOLL-FREE

DOCTORS' BILL

The "collateral source" bill passed by the New Jersey Legislature and signed into law by Governor Kean is a significant victory in the Exchange's efforts to reform the medical malpractice legal system. The Exchange provided the leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. Elimination of some costly inequities in our tort system will help moderate the ever-increasing severity of insurance losses.

DOCTORS' NOTEBOOK

*Trustees' Minutes; UMDNJ
Notes; MSNJ Auxiliary;
Physicians Seeking
Location in New Jersey*

Trustees' Minutes April 10, 1988

A regular meeting of the Board of Trustees was held on April 10, 1988, at the Executive Offices in Lawrenceville. Detailed minutes are on file with the secretary of your county society. A summary of significant actions follows:

Executive Committee . . . Approved the adoption of the following resolution:

Resolved, that the Medical Society of New Jersey reaffirm its endorsement of the Foundation of the University of Medicine and Dentistry of New Jersey, and express its strong support for the goals and purposes of the Foundation; and be it further

Resolved, that the Medical Society of New Jersey encourage its membership to make individual contributions to the Foundation; and be it further

Resolved, that available space in NEW JERSEY MEDICINE may be used from time to time to place public service "advertisements" to the membership, encouraging contributions to the Foundation.

Report of Executive Director . . .

(1) MSNJ Paid Membership . . . Noted that as of March 31, 1988, paid membership totals 6,659.

(2) MSNJ Financial Statements . . . Reviewed and approved the financial statements for the period ending February 29, 1988.

(3) SCI Update . . .

(a) Licensing Reform Legislation . . . Noted that no further information has been received from Senator Codey.

(b) State Board of Medical Examiners (SBME) . . . Asked Dr. Malta, President of SBME, to convey to the Federation of Licensing Boards, MSNJ's concern for preserving the confidentiality of medical information on individuals in voluntary treatment programs.

(c) Attorney General's Office . . . Noted Attorney General Office personnel are reviewing the SCI report and much sorting out will have to be done before this matter is introduced into the legislature.

(4) Meeting with Chief Justice Wilentz . . . Noted the following: Chief Justice Wilentz agreed to place on the court's rule-making agenda an item for discussion concerning MSNJ's and MIENJ's belief that Rule 4:21 in its pre-1984 form should be reinstituted as a mandatory procedure in New Jersey; Chief Justice Wilentz suggested that the approved format for requesting the court to consider a rule of evidence be followed, and that MSNJ will consider using that mechanism on the certificate of merit issue; and Chief Justice Wilentz offered to publish reminders to the Bar to investigate appropriately when filing a lawsuit, and after filing to have the lawsuit dismissed if in the course of discovery they cannot develop a case, and he indicated that defense attorneys that bill in excess of their time actually spent would be subject to discipline.

NJ Hospital Association (NJHA)

. . . Noted the following items: NJHA has designed a four-part workplan to expedite achievement of an 11 percent permanent, across-the-board hospital rate increase over and above the projected normal inflationary increases; a Medical Waste Fact-Finding Commission has been set up; and the NJHA Council on Planning's Subcommittee on AIDS has submitted a report recommend-

ing alternative levels of care and adequate health services for AIDS patients, and that incentives may be offered to institutions willing to expand their work with AIDS patients.

Council on Legislation . . . Approved all the positions recommended by the Council on Legislation with the exception of: S-1163 (Osteoporosis Study Commission), changed position to disapproved because osteoporosis is a well-known, researched, and publicized condition, and there is no need to create a special legislative commission to conduct studies when comprehensive, scientific literature readily is available; and, S-448 (Patient Rights), supported the Council's position, but added the following: conditional approval, pending deletion of the litigation option of the bill, since it will produce unnecessary delays and cost patients extra legal expense; furthermore, there should be a clause or section added to the bill recognizing that patients have certain obligations to cooperate in their treatment and to comply with advice and directions.

Committee on Finance and Budget

. . . Approved the following recommendations:

That the budget for fiscal year beginning June 1, 1988, and ending May 31, 1989, in the amount of \$3,750,000 with \$2,537,000 to be raised through member assessments be adopted.

That the 1989 assessments be set at \$350 per regular dues-paying member. (The 1988 assessment is \$330).

That the 1989 assessment be set at \$60 per member for affiliate members—no longer practicing in New Jersey. (The 1988 assessment was \$40).

That the 1989 assessment for associate members (interns-residents licensed in New Jersey) and licensed residents, provided the individual is in a residency program entered upon within a reasonable time after his or her graduation from medical school, be set at \$25. (No change from prior year).

That the 1989 assessment be set at \$10 per student for medical students. (No change from prior year).

Committee on Long-Range Planning and Development . . .

(1) Advisory Committee to the Auxiliary . . . Approved the following recommendation:

That the Advisory Committee to the Auxiliary be discontinued.

(2) Committee on Medical Student Loan Fund . . . Did not adopt the following recommendation:

That the Committee on Medical Student Loan Fund consist of two members, namely, a chairman and a vice-chairman, to be appointed by the President.

(3) Committee on Revision of Constitution and Bylaws and Committee on Long-Range Planning and Development: Noted that the Committee on Long-Range Planning and Development was opposed to the merger of its Committee with the Committee on Revision of Constitution and Bylaws.

(4) Committee on Child Health . . . Approved the following recommendations:

That the Special Committee on Child Health be discontinued.

That the activities of the Special Committee on Maternal and Child Care be expanded to include the Special Committee on Child Health.

(5) Committee on Occupational Health, Workers' Compensation, and Rehabilitation . . . Approved the following recommendations:

That the Special Committee on Occupational Health, Workers' Compensation, and Rehabilitation be discontinued.

That the activities of the Special Committee on Occupational Health, Workers' Compensation, and Rehabilitation be assumed by the Council on Medical Services.

(6) Ad Hoc Committee on Health Care Reimbursement Policies . . .

Noted that the following recommendations were not adopted. And, noted the Ad Hoc Committee on Health Care Reimbursement Policies will be disbanded, and the Council on Medical Services will assume responsibility for its activities and Dr. Formica will review membership and select individuals to serve on the council:

That the Ad Hoc Committee on Health Care Reimbursement Policies be changed to a permanent special committee of the Society, to be known as the Committee on Health Care Reimbursement Policies, to perform as originally charged.

(7) Speaker and Vice-Speaker of the House of Delegates . . .

(a) Speaker and Vice-Speaker Positions . . . Voted to postpone consideration of the following recommendations until the next regular meeting (following the Annual Meeting), when the speaker of the House can be present:

That the Speaker and Vice-Speaker be elected by the House of Delegates through the Society's Nominating Committee process.

That the term of office for the Speaker and Vice-Speaker be for two years, and that they be limited to three such terms.

(b) Ex Officio Seat on Board of Trustees . . . Voted to postpone consideration of the recommendation until the next regular meeting (following Annual Meeting), when the speaker of the House can be present to address the issue:

That the Speaker of the House of Delegates be given a non-voting, ex-officio seat on the Board of Trustees.

Committee on Cancer Control . . . Voted to postpone consideration of the following recommendation until the next regular meeting of the Board (following the Annual Meeting), when the chairman can be present to answer questions:

That the following amended version of Substitute Resolution #15, Infusaid Pump Recognition, be approved:

Whereas, the use of implantable infusion pump (i.e. Infusaid) for certain chemotherapy treatments has had acceptance by the medical community, as well as approval and payment by third-party insurers; and

Whereas, the use of such pumps for the control of pain utilizing morphine infusion has been shown to be of great benefit for the treatment of chronic pain; now therefore be it

Resolved, that the Medical Society of New Jersey urge the State Department of Insurance to do all in its power to make the use of implantable infusion pumps available to New Jersey residents for intrathecal or epidural administration of morphine for the treatment of intractable pain due to cancer.

Committee on Conservation of Vision . . . Approved the following recommendation:

That the 1988 Eye Health Screening Program be held the week of September 26, 1988.

Task Force on AIDS . . . Adopted the recommendations and statements of the Task Force; the entire report will be published in the *Transactions*.

Senior Medical Courtesy Program . . . Received as informational, the results of a survey measuring the effectiveness of the Senior Medical Courtesy Program.

UMDNJ Notes

Stanley S. Bergen, Jr., M.D.
President

The first program in New Jersey to train physicians in the specialty of neurosurgery has been approved for the Newark campus of UMDNJ by the American Board of Neurological Surgery. The six-year program will begin July 1 at University Hospital.

To meet the stringent standards

ARE YOU MOVING?

If so, please send a change of address to *NEW JERSEY MEDICINE*, Medical Society of New Jersey, Two Princess Road, Lawrenceville, NJ 08648, at least six weeks before you move.

of the Board, the hospital had to attain a volume of several hundred sophisticated neurosurgical procedures a year, covering a full spectrum of neurosurgical diseases. The residency program is the first such residency approved in many years in this specialty.

University Hospital will be the site of most of the clinical training in direct patient care and management and in operative procedures. Two six-month periods of clinical training will take place at Saint Barnabas Medical Center, Livingston, an affiliated teaching hospital.

The accreditation recognizes the growing magnitude and sophistication of neurosurgery at University Hospital since the section was launched in 1974 by Abbott J. Krieger, M.D. Dr. Krieger, director of the program and professor of surgery at UMDNJ-New Jersey Medical School, also is codirector of University Hospital's neuro-intensive care unit, one of the most advanced in the country. The unit contains eight individually monitored bed-stations. A computerized evoked-potential monitor used in the unit and in the operating room can follow faint nervous system electrical signals and transmit information to locate and identify injuries.

Through such instrumentation and advances in imaging with computerized tomography (CT) scanning and magnetic resonance imaging (MRI), neurosurgery has become a particularly high-tech specialty. Conventional surgery, for example, now is supplemented by such equipment as carbon dioxide lasers, more exact than a scalpel, and stereotaxis, a method to reach accurately and safely the deepest portion of brain tissue needed for biopsy.

As a result of the new capabilities, some formerly inoperable conditions can be addressed. Certain brain tumors, previously not treatable, can be removed, or a life-threatening aneurysm can be repaired by the new techniques.

Dr. Krieger has appointed Otakar R. Hubschmann, M.D., professor of surgery at the medical school, to serve as the educational director of the training program at Saint Barnabas Medical Center. Dr. Hubschmann has been actively developing the neurosurgical clinical program at Saint Barnabas since 1986.

Another "first" recorded by

UMDNJ in recent weeks was the opening of New Jersey's first countywide program to treat mentally ill chemical abusers, known as MICA patients. The Camden County program, supported by a \$200,000 grant from the state's Departments of Human Services and Health, is based at the Cherry Hill Division of Kennedy Memorial Hospitals-University Medical Center, an affiliate of our School of Osteopathic Medicine. The funding will allow for the renovation of a 6,000 square-foot facility, with separate entrance, near the hospital's existing inpatient psychiatric and alcohol/drug rehabilitation units. The program will be ad-

ministered by project directors from the UMDNJ-Community Mental Health Center at Piscataway.

Finally, special tips-of-the-hat to two faculty members at our Newark-based UMDNJ-New Jersey Medical School, Drs. William E. Neville and James Oleske.

Dr. Neville, professor of surgery who joined the faculty in 1971, has been awarded the Sir William Osler Humanitarian Award by the American Lung Association of New Jersey.

Dr. Oleske, director of pediatric allergy, immunology, and infectious diseases at the Newark campus, was among ten New Jerseyans to receive a 1988 Pride Award.

MSNJ Auxiliary

Mrs. Angie Campo, President

At the Annual Session of the Medical Society of New Jersey Auxiliary, Mrs. Frank Campo was installed as the 62nd president and was the 6th Auxiliary member from Mercer County to hold that honor.

Angie Campo is a graduate of the Trenton Public School system and the Georgetown University School of Nursing. After working as assistant night supervisor and coordinator of the student health program at Georgetown University Hospital, she returned to New Jersey. In Trenton, she worked in the operating room at St. Francis Medical Center where she met and married pathology resident, Frank Campo. When their three daughters, Alessandra, Julie, and Frances, were of school age, Angie became chairman of the PTA Health program. At the same time, she became active with the Mercer County Medical Society Auxiliary; she was president when the Medical Society and the Auxiliary worked together on the pilot program for Colorectal Cancer Screening.

Angie also has been president of the St. Francis Medical Center Auxiliary; an officer of the Council on Auxiliaries of the New Jersey Hospital Association; and presently, is a Reach to Recovery Volunteer with the Mercer County Chapter of the American Cancer Society.

In all of her activities she has been greatly supported by her daughters and by her husband. Dr. Campo has served the medical community as President of the Mercer County Medical Society and as a member of the Medical Society of New Jersey

Mrs. Angie Campo

Board of Trustees for nine years.

Although Angie has been more active in health-related projects, one of the most enjoyable and satisfying ones had nothing to do with medicine. Through the Central Jersey Chapter of the American Italian Historical Association, she was chairperson of a committee that published posthumously a collection of delightful and moving vignettes written by a friend and former teacher about his experiences growing up in the Italian section of Trenton.

The Campo family enjoys traveling and all three daughters share Angie's hobby of needlepoint. However, Angie is the one who is addicted to British mystery stories; it was this enthusiasm that once took Frank and her on a wandering tour of the old halls of Saint Bartholomew's Hospital in London. They eventually reached the laboratory where a wall plaque commemorates the official, first meeting of John H. Watson, M.D., and Sherlock Holmes.

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ALLERGY—Jerry Michael Shier, M.D., 11546 February Cir., Apt. 202, Silver Spring, MD 20904. UMDNJ 1982. Also, clinical immunology. Board eligible. Board certified (PED). Group, partnership, solo. Available July 1988.

ANESTHESIOLOGY—Kenneth Lum, M.D., 7240 Twin Eagle Lane, Fort Myers, FL 33912. Downstate 1985. Board eligible. Available.

CARDIOLOGY—Donald G. Rubenstein, M.D., 1037 3rd St., #303, Santa Monica, CA 90403. Louisiana 1980. Board eligible. Group or partnership. Available August 1988.

DERMATOLOGY—Cheryl S. Citron, M.D., 885 Sussex Rd., San Marino, CA 91108. Miami 1984. Board eligible. Group, partnership, solo. Available July 1988.

ENDOCRINOLOGY—Robert P. Castellucci, M.D., 3509 Kensington Ave., #3, Richmond, VA 23221. St. George's 1982. Board eligible. Partnership or group. Available September 1988.
Gerald B. Miele, M.D., 110 Fleet Pl., Mineola, NY 11501. Rush 1983. Also, internal medicine. Board eligible. Partnership, group, solo. Available July 1988.

FAMILY MEDICINE—Roy Berkowitz-Shelton, M.D., 132 Grove Pk., Ft. Dix, NJ 08640. Georgetown 1981. Board certified. Partnership. Available.

Serge I. Kaftal, M.D., 30 South Auten Ave., Somerville, NJ 08876. Lodz (Poland) 1980. Board eligible. Solo, partnership, group. Available November 1988.

GASTROENTEROLOGY—Anil Agarwal, M.D., 18 Maltese Dr., Fair Lawn, NJ 07410. LLRM Medical (India) 1979. Also, internal medicine. Board eligible. Board certified (IM). Available July 1988.

David Rosenbock, M.D., 5 Riggs Pl., West Orange, NJ 07052. UMDNJ. Board eligible. Board certified (IM). Group, partnership, solo. Available July 1988.

INTERNAL MEDICINE—Anil Agarwal, M.D., 18 Maltese Dr., Fair Lawn, NJ 07410. LLRM Medical (India) 1979. Also, gastroenterology. Board certified. Available July 1988.

Paul R. Axelrad, M.D., 666 Ninth St., Lakewood, NJ 08701. St. George's University 1985. Board eligible. Group or partnership. Available July 1988.

Marc Hanfling, D.O., 26 Glen Lane, Cherry Hill, NJ 08002. New York College 1981. Also, cardiology. Board certified. Board eligible (CARD). Group, partnership, solo. Available.

Lalitha B. Iyer, M.D., 84 Hempstead Dr., Somerset, NJ 08873. Madras (India) 1980. Board eligible. Group, partnership, emergency room. Available July 1988.

Peter Kuzmick, D.O., 62 Diamond Ave., Fort Rucker, AL 36362. Kansas City College 1980. Board certified. Group or partnership. Available July 1988.

Gerald B. Miele, M.D., 110 Fleet Pl., Mineola, NY 11501. Rush 1983. Also, endocrinology. Board eligible. Partnership, group, solo. Available July 1988.

Edward C. Phillips, M.D., 24 Walnut St., Summit, NJ 07901. Downstate 1984. Board eligible. Group, partnership, solo. Available July 1988.

Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buf-

falo 1982. Board eligible. Board certified (PED). Also, pediatrics. Group, partnership, academic. Available October 1988.

PEDIATRICS—Linda York-Chance, M.D., 435 East 70th St., New York, NY 10021. Connecticut 1985. Board eligible. Clinic or emergency room. Available July 1988.

Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buffalo 1982. Also, internal medicine. Board certified. Board eligible (IM). Group, partnership, academic. Available October 1988.

PSYCHIATRY—Jozsef Telkes, M.D., c/o John Black, 3901 Crosswicks-Hamilton Square Rd., Robbinsville, NJ 08691. Pecs (Hungary) 1978. Board certified. Group or research. Available September 1988.

SURGERY—James H. Frost, M.D., 655 W. Irving Pk. Rd., Apt. 4306, Chicago, IL 60613. Guadalajara; Mt. Sinai Fifth Pathway 1983. Board eligible. Group or partnership. Available July 1988.

We'll put your patients up on a pedestal.

The Stone Center of New Jersey, the leader nationwide in lithotripsy advancement, is the premier center in the country to offer the bath-free Dornier HM-4 lithotripter.

At the Stone Center your patients rest comfortably on a water filled cushion...

utilizing the most advanced lithotripsy technology available.

Because they are not submerged in a tub, the procedure is less stressful and easier to perform.

Your patients are treated in a sophisticated atmosphere by the state's top lithotripsy professionals. From our convenient

valet parking to our helpful and efficient patient representative who will schedule your cases...you'll rate our service second to none.

So contact Arlyn Rayfield, Executive Director, today and schedule an appointment

for machine demonstrations or to receive additional information on ESWL® treatment.

Because your patients deserve to be put up on a pedestal.

The Stone Center of New Jersey. For the new wave in kidney stone treatment.

ACUPUNCTURE & ELECTRO-THERAPEUTICS IN CLINICAL PRACTICE

NY State Boards of Medicine & Dentistry 25-hour accredited seminar & workshop on the latest theories & techniques of manual and electro-acupuncture, TENS & simple non-invasive diagnostic methods (including cardio-vascular & neuromuscular systems & "Bi-Digital O-Ring Test"), applicable toward the 300-hour requirement for MDS & DDS acupuncture certification, will be given for licensed clinicians (with or without prior training) the weekends of **June 17-19** and **Dec. 9-11, 1988** at the Milford Plaza Hotel, 45th St. and 8th Avenue, Manhattan. The **4th International Symposium on Acupuncture & Electro-Therapeutics**, with many world leading scientists & clinicians will be held at the Columbia U Sch. of Int. Affairs, NYC, **Oct. 13-16, 1988**. Co-sponsored by the Int. College of Acupuncture & Electro-Therapeutics; its official journal. *Acupuncture & Electro-Therapeutics, Res., Int. J.* (published by Pergamon Press, indexed in 15 major indexing periodicals: Index Medicus, etc.); Heart Disease Research Foundation; Neuroscience Dept. & NY Pain Ctr., Long Island College Hospital; (SUNY-Brooklyn Health Science Ctr.); Nordic Medical Acupuncture Society; & Schmerz-Therapeutische-Kolloquium (W. Germany); etc. Also eligible for AMA/CME credit, category 1. For info on meetings or submission of papers, contact Y. Omura, MD, ScD, 800 Riverside Drive (8-I), NYC 10032. Tel: (212) 781-6262 or (212) 928-0658, or P. Shinnick, PhD, (212) 941-0870 or Mr. Spence (212) 866-8499. Approved Acupuncture Program by NYSBM&D.

*Your medical practice
is a business, and if
that business does not
run efficiently, it will
affect your patient and
public relations.*

MARY ANN HAMBURGER ASSOCIATES

*would evaluate each element
of your office operations and
work with you...confidentially...
on an individual basis, to help
you achieve your aims as a
businessperson and as a
practicing physician.*

Mary Ann can help by evaluating your:

- APPOINTMENT and/or SURGERY SCHEDULING • BILLING
- BOOKKEEPING • COLLECTIONS • CPT CODES and MACC
- PROFILES— ICD CODES • EQUIPMENT and SUPPLIES • FEE
- SCHEDULES • FILING SYSTEM • HIRING and TRAINING of
- NEW and PRESENT PERSONNEL • INSURANCE (THIRD PARTY
- BILLING) • OFFICE LAYOUT and LOCATION • PATIENT FLOW
- RECALL SYSTEM • RECRUITMENT FOR HOSPITALS
- PURCHASING and SELLING of MEDICAL PRACTICES
- TELEPHONE MANAGEMENT

**Mary Ann can recommend specialists
for your business practice in these vital areas:**

- ACCOUNTING • FINANCE • INSURANCE • LAW

**Mary Ann Hamburger offers you many services
ranging from a one-time survey to a continuing service
in which she will make regular visits to your office
to help with any pending problems.**

DONALD F. SMITH & ASSOCIATES

LETTERS TO THE
EDITOR

Dr. David Eckstein

March 23, 1988

Dear Doctor Krosnick:

The obituary you published in the March issue of *NEW JERSEY MEDICINE* about David Eckstein was very well done. I am writing to say that I would like to add an "if only" to the story of David Eckstein, physician. If only I had videotaped this man!

It was my privilege to know and to work with Dave Eckstein from 1968 until his retirement as the medical director at Meadow Lakes and then to see him from time to time in other capacities until near the time of his death. This courtly gentleman of small stature and great heart was a man whose love for his patients, especially the elderly, sparkled from his eyes and leaped from his touch. His measured and mellow deep voice calmed many a fear and soothed all. He fought for the elderly and the poor on all fronts. He could be moved to tears of anger when recounting examples of lapses of medical professionalism or absent integrity. David's bedside manner was wonderful.

Dave Eckstein faced major illness and surgery with great strength and courage. He was so very careful about the feelings of those he entrusted with his care. If only he

could be heard and seen today by the medical students we are teaching and the residents who thirst for bedside rounds with experienced clinicians. This clinician with the shock of white hair and measured tones was a consummate listener and a diagnostician of note. We are so much richer that he came this way.

(signed) James J. Chandler

Caesarean Sections

February 17, 1988

Dear Doctor Krosnick:

Your readers may be interested in a brief report on the gradually increasing percentage of caesarean (C) sections in New Jersey from 1980 to 1987.

Data were reviewed on claims paid by Blue Cross and Blue Shield of New Jersey from 1980 through 1987 for vaginal delivery and C/section. Nationwide trends are verified by our data, as indicated below. We note C/section percentage somewhat higher than reported nationally.

Year	Vaginal Delivery	C/Section
1980	24,673	6,770
1981	26,678	7,333
1982	25,765	7,778
1983	24,455	7,731
1984	23,195	8,090
1985	24,164	8,683
1986	22,093	8,762
1987	22,067	9,454

Year	Total	% C/Section
1980	31,443	21.5
1981	34,011	21.6
1982	33,543	23.2
1983	32,186	24.0
1984	31,285	25.9
1985	32,847	26.4
1986	30,855	28.4
1987	31,521	29.99

Reasons for increasing numbers of C/sections are under debate elsewhere. This letter is merely to report statistics. We are monitoring areas where utilization seems unusually high.

Viral Diagnostics

March 8, 1988

Dear Doctor Krosnick:

During the fourth year of operation, UMDNJ-Robert Wood Johnson Medical School Viral Diagnostic Laboratory identified 384 viruses from a total number of 1,808 specimens submitted, for an isolation rate of 21 percent. As was true during the past several years, herpes simplex virus continues to be the predominant virus isolated. However, this year it accounted for 47 percent of viruses isolated as contrasted to last year when it accounted for 58 percent of viruses isolated. The second most prevalent virus this year was respiratory syncytial virus (RSV), ranked only fourth during the 1986 calendar year, reflecting an unusually severe epidemic of moderate to severe RSV pneumonitis and bronchiolitis in infants and children at the close of 1987. The third most common virus isolated was cytomegalovirus (CMV), accounting for 18 percent of the isolates, both this past calendar year and for calendar year 1986.

Specimens Submitted for Viral Identification—1987	
Total Submitted	1,808
Viruses Identified	384
Percent Positive	(21%)
Herpes Simplex Virus	179
Respiratory Syncytial Virus	75
Cytomegalovirus	69
Rotavirus	37
Enterovirus	15
Herpes Varicella Zoster Virus	5
Adenovirus	3
Influenza Virus	1

Rotavirus came in fourth, enterovirus remained in fifth place, with herpes varicella zoster virus, adenovirus, and influenza virus bringing up the rear. It is our goal this year to continue to offer high-quality, rapid viral diagnostic services to hospitals and physicians in central New Jersey and to make readily available rapid viral diagnosis of the human immunodeficiency virus. We hope this information is of interest to the physicians of New Jersey.

BOOK REVIEWS

Dermatology for the House Officer; Magnetic Resonance Imaging of the Knee; Magnetic Resonance of the Musculoskeletal System; Manual of Dermatologic Therapeutics; MRI of the Body; Organ Transplantation and Replacement; Pediatric Neurology and Neuroradiology

Dermatology for the House Officer

Peter J. Lynch, M.D. Baltimore, MD, Williams & Wilkins, 1987. Pp. 353. (\$13.95)

Five years after publication of the successful initial offering, this is an updated second edition of a very educational handbook. With a little effort, and use of this pithy guide, one can develop lasting skills in recognizing almost all common skin problems, and appreciate the important signs of internal diseases. The physician is taught, step-by-step, how to examine skin carefully, observe and describe lesions, and then chart a mental course to the correct diagnosis. The simplicity, and utility, of this systematic approach is emphasized by the lack of a single clinical photograph within the volume. Sufficient dermatopathological and pathological material amplifies each subject and leads to a considered discussion of therapeutic options. Current references and additional reading suggestions point to worthwhile sources of supplemental information. This pocket-sized treasure is a compressed, full course in dermatological basics. The paper, printing, and layout are just serviceable, keeping production costs low. This is a best buy.

Christopher M. Papa, M.D.

Magnetic Resonance Imaging of the Knee

Jerold H. Mink, Murray A. Reicher, John V. Crues, III. New York, NY, Raven Press, 1987. Pp. 178. (\$79.50)

The authors of this work have assembled an excellent review of a technique that at many centers is replacing conventional arthrography. The introductory discussion of physics gives the reader a practical understanding of the role of technical parameters in image quality. A list of various imaging protocols is included. (Some institutions also use fast field echo techniques.)

While the body of the book reviews a broad spectrum of topics, it stresses meniscal and ligamental diseases. In addition to being well-written and displaying scans of good quality, the book also includes pathological photographs. A chapter entitled, "Pitfalls in Interpretation," includes a review of normal variants and artifacts.

This timely and clinically oriented text is highly recommended to physicians who have an interest in this area.

Neil B. Horner, M.D.

Magnetic Resonance of the Musculoskeletal System

Thomas H. Berquist, Richard L. Ehman, Michael L. Richardson (eds). New York, NY, Raven Press, 1987. Pp. 220. (\$28)

This small, inexpensive monograph provides an overview of the role that magnetic resonance imaging (MRI) plays in the evaluation of the musculoskeletal system.

Beginning with a review of the basic theory of MRI, the treatise also includes a discussion about interpretation that is very informative.

The range of topics includes tumor, infection, trauma, and the spine, and the scans display good quality. To our advantage, the clearly written text makes reference to other modalities. For example, the chapter entitled, "Miscellaneous Conditions and Future Potentials," includes a concise review of osteonecrosis. I would have liked to see further attention given to the diseases of the various joints.

In all, the book is recommended for the physician who desires a brief introduction to this area.

Neil B. Horner, M.D.

Manual of Dermatologic Therapeutics. With Essentials of Diagnosis. Third Edition

Kenneth A. Arndt, M.D. Boston, MA, Little, Brown and Co., 1983. Pp. 347.

Near the turn of this century, the late W. A. Pusey, M.D., stated, "Skin diseases occur on the surface of the body where everyone can see them, but few recognize them. Because of the first fact and despite the second fact, most physicians are inclined to treat them." Current proof of this aphorism lies in the success of this manual, now in the third printing of its third edition.

As the title proclaims, this text is heavy on treatment and light on diagnosis. It is an attractive, spiral bound, pocket volume with 17 small color photographs contained in its four central pages. (The latter are as useful as a dollop of whipped cream on top of a crock of baked beans, being decorative, out of place, and an unnecessary expense.)

Dr. Arndt, Professor at Harvard Medical School, and current editor of the *Archives of Dermatology*, has labored earnestly in producing his authoritative opus. Unfortunately, it will be of rather limited educational value to most nondermatologists, for it fails to instruct simply in the basics. The principles of dermatological therapy, particularly the selection of appropriate vehicles, is a particularly weak section, and should be the strongest. Some of the information is so overwhelming that it surely will discourage anyone less than a skin specialist. The entry on isotretinoin, which leads the listing of acne preparations in the formulary section, is a good example. While it is a retinoid of prodigious utility, the catalogue presented could only warm the heart of another dermatologist. It might be nice to know that it finds use in pityriasis rubra pilaris, epidermolytic hyperkeratosis, Darier's disease, keratosis palmaris et plantaris, congenital ichthyosiform erythroderma, dissecting cellulitis of the scalp, and hidradenitis suppurativa, but the student cannot find necessary information on these conditions in the manual.

There is an admirable attempt to deal with the economics of prescriptions by providing prices of various

therapies, but the information becomes obsolete before it is printed.

The major fault of this manual is that the therapeutic information, likewise, is out-of-date. What was best in 1983, may be inappropriate five years later. The section on herpes simplex fails to include oral acyclovir therapy because it wasn't available when the text was prepared, and there is no effort to correct the omission with the new printing.

Dermatology for the House Officer (2nd Edition) remains a much better buy, and my pick as dermatology manual-of-choice.

Christopher M. Papa, M.D.

MRI of the Body

Charles B. Higgins, M.D. and Hedvig Hricak, M.D. (eds). New York, NY, Raven Press, 1987. Pp. 608. (\$125)

The editors of *MRI of the Body* are from the University of California, San Francisco; the contributing editors are based worldwide.

At a time when magnetic resonance imaging (MRI) of the body is becoming a more important tool in clinical evaluation, this text is useful. Beginning chapters, Wehrli's on fast field echo techniques and von Schultheiss's on blood flow, provide a review of physics. Broad in scope, the text reviews MRI of the neck, thorax (including the heart), breasts, abdomen, pelvis, vascular system, musculoskeletal system (including joints), and the spine. The cardiac section is divided into acquired diseases, congenital diseases, and "cine" imaging. A chapter on obstetrical MRI that at present has limited clinical usefulness also is included. The book's chapters are

abundant in their amount of state-of-the-art images; the text is clinically oriented and well-written. Technical discussions are kept to a minimum.

The book is highly recommended to the physician who wishes a good clinical basis to the field.

Neil B. Horner, M.D.

Organ Transplantation and Replacement

G. James Cerilli, M.D. Philadelphia, PA, J. B. Lippincott Company, 1988. Pp. 732. (\$95)

This text in 49 chapters achieves the author's goal: it summarizes the pertinent science of transplantation and transplant immunology. Renal transplantation is covered in detail and other organ transplants (heart, liver, pancreas, lung, skin, bone, bone marrow, cornea, and small bowel) are covered in dedicated chapters. Finally, artificial organs are exemplified by chapters devoted to the artificial heart and insulin delivery systems. Separate chapters devoted to ethics and legal issues round out the text. I especially appreciated the chapter authored by Francis Moore which outlines the evolution of this exciting field.

The charts and graphs generally are clear but many are peculiar to clinical transplantation and may be confusing to the uninitiated. The black-and-white photomicrographs surprisingly are good. Other illustrations, especially the line drawings, are excellent.

There is an enormous fund of information contained in this volume, probably collected by endless library hours reviewing literature. Cerilli has assembled the best authorities

in the field and distilled their work into a very useful reference. This text will be invaluable to any clinician involved with the care of transplant patients. It also would be a good addition to any hospital library.

Dennis Filippone, M.D.

Pediatric Neurology and Neuroradiology

C. Diebler and O. Dulac. New York, NY, Springer-Verlag, 1987. Pp. 408. (\$165)

The work of two French physicians, this book is an orderly and well-illustrated radiologic correlation of the neurologic diseases of childhood.

Its sections include malformations, neurocutaneous syndromes, metabolic diseases, infections, vascular diseases, tumors, and trauma. Further subdivisions are devoted wholly to the diseases and their clinical aspects, reviewing them in a concise and clear style. The neuroradiologic discussion almost exclusively is centered around computed tomography. Unfortunately, MRI is not included. The scans are of very good quality, and the generous inclusion of so many gives the book a text-atlas format. There are some variations in the authors' terminology vis-à-vis what is commonly used in this country. For example, Chiari malformations are listed under Cleland-Chiari malformations.

The authors have compiled a useful monograph that integrates the clinical aspects of the disease entities with CT findings. The book is highly recommended.

Neil B. Horner, M.D.

**Kidney stones show up in
some hard-to-reach places.**

**Luckily, the New Jersey
Kidney Stone
Treatment Center
is easy to get to.**

You shouldn't have to go out of your way for lithotripsy services to complement your practice.

The New Jersey Kidney Stone Treatment Center is centrally located in New Brunswick, New Jersey, near statewide highways, for easy access for you and your patients.

The Center is equipped with the latest Dornier HM4 "tubless" lithotripter, which eliminates the need for a water bath. That means easier patient handling, and greater patient comfort.

And the Center is located at a major academic medical center, with full medical back-up. Patients are treated on an outpatient or inpatient basis.

Any board-eligible or board-certified urologist who has completed the ESWL training course and is licensed in the State of New Jersey may apply for privileges at the Center.

Physicians may also refer their patients to the Center for treatment by a member of our medical staff. After the procedure, patients are referred back to their own urologists for follow-up care.

For a credentialing package, or for more information about lithotripsy, call Center Director Diane DiGiulio at 1-800-542-8887, 8 a.m.-5 p.m., Monday-Friday.

New Jersey Kidney Stone Treatment Center

Located at Robert Wood Johnson University Hospital
One Robert Wood Johnson Place
New Brunswick, New Jersey 08901

The New Jersey Kidney Stone Treatment Center is operated by Health Horizons, (ESWL), L.P., affiliated with the following hospitals: Community Memorial Hospital, Freehold Area Hospital, Helene Fuld Medical Center, Jersey Shore Medical Center, Raritan Bay Medical Center, Riverview Medical Center, Robert Wood Johnson University Hospital, St. Francis Medical Center, St. Peter's Medical Center, Somerset Medical Center.

TELL YOUR PATIENTS THEIR CHOLESTEROL NUMBER... BEFORE THEY ASK.

Reducing high blood cholesterol reduces the risk of heart disease. That's why we're telling Americans—through a national public service advertising campaign—to know their cholesterol number. Your patients may soon be asking you for their number and what it means.

And when they do, we can help. The National Cholesterol Education Program, administered by the National Heart, Lung, and Blood Institute, has developed adult treatment guidelines to help you identify high-risk patients and use the appropriate diet and/or drug therapy for those with elevated cholesterol levels.

Help your patients reduce their risk of heart disease. For a free copy of the *Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults*, complete the form below.

***Drs. Bristol; Demy;
Hutchinson; Stein;
Strenger***

Dr. Frank E. Bristol, II

General practitioner Frank Ernest Bristol, II, M.D., died on March 4, 1988, at the age of 74. Born in Philadelphia, Dr. Bristol received his medical degree in 1939, from Hahnemann Medical College and Hospital, Philadelphia. He maintained a medical practice in Dayton, retiring in 1979. Dr. Bristol later was associated with a practice at the Rossmoor Medical Center, and for the last five years was employed by Sera-Tech Laboratories, North Brunswick. During World War II, Dr. Bristol served in the United States Army medical corps as a lieutenant-colonel. He was a member of our Middlesex County component and of the American Medical Association.

Dr. Nicholas G. Demy

Radiologist Nicholas George Demy, M.D., died on February 24, at the age of 83. Born in Austria-Hungary, Dr. Demy emigrated to the United States in 1912, and received his medical degree from Marquette University School of Medicine, Milwaukee, Wisconsin, in 1943. During World War II, he was a captain in the United States Army medical corps stationed in Okinawa. Following the war, Dr. Demy joined the late Dr. James Boyes in a radiology practice at Muhlenberg Medical Center,

Plainfield, and at Somerset Medical Center, forming Associated Radiologists. Dr. Demy was chief of radiology at Somerset Medical Center, until retiring in 1974, when he moved to East Hampton. During his years of medical practice, Dr. Demy visited many Third World nations, serving as a medical ambassador to help modernize medical facilities. Dr. Demy was a member of the Bridgewater Township Board of Health from 1949 to 1957, and taught for many years at Bellevue Hospital, New York. A diplomate in radiology, and a fellow of the American College of Radiology, Dr. Demy was a member of the Radiological Society of New Jersey, serving as secretary, vice-president, and president; of our Somerset County component; and of the American Medical Association.

Dr. George F. Hutchinson

Retired eye, ear, nose, and throat specialist George Forman Hutchinson, M.D., died on April 3, 1988, at the age of 85. A Robbinsville native, Dr. Hutchinson received his medical degree from Hahnemann Medical College and Hospital, Philadelphia, in 1928. After an internship with McKinley Hospital (now Helene Fuld Medical Center), Dr. Hutchinson maintained the affiliation, serving as the Hospital's department chief. He was a member of the clinical staff of Wills Eye Hospital, Philadelphia, and was school physician for both West Windsor and Washington Townships. A charter member of the New Jersey Academy of Ophthalmology and Otorhinolaryngology, Dr. Hutchinson also was a member of our Mercer County component and of the AMA. During World War II, Dr. Hutchinson was a captain in the United States Army medical corps. In 1978, he received MSNJ's Golden Merit Award for 50 years of medical practice.

Dr. Martin H. Stein

Retired surgeon Martin Henry Stein, M.D., of Elizabeth, died on January 19, 1988, at the age of 97. A native of Lithuania, Dr. Stein received his medical degree from Medico-Chirurgical College of Philadelphia, Pennsylvania, in 1914. Affiliated with St. Elizabeth Hospital, Dr. Stein was a fellow of the American College of Surgeons, and was a member of our Union County Com-

ponent and of the AMA. During World War I, Dr. Stein served on active duty with the United States Army medical corps, emerging with the rank of lieutenant. He received the Golden Merit Award in 1964.

Dr. Lawrence Strenger

Former chief of neurosurgery at both Atlantic City Medical Center and Shore Memorial Hospital, Somers Point, Lawrence Strenger, M.D., 57, died on March 26, 1988 following a lengthy illness. Born in New York, Dr. Strenger received his medical degree from the Chicago College of Medicine and Surgery, Illinois, in 1955. He maintained an Atlantic City private practice for some years, and was affiliated with several hospitals as a consulting neurosurgeon: Burdette Tomlin Memorial Hospital, Cape May Court House; Ancora Psychiatric Hospital, Hammonton; William B. Kessler Memorial Hospital, Hammonton; Community Memorial Hospital, Toms River; and Kimball Medical Center, Lakewood. A diplomate in neurological surgery, Dr. Strenger was a fellow of the American College of Surgeons. The recipient of numerous medical fellowships, Dr. Strenger was a member and past-president of the Atlantic County Medical Society and of the New Jersey Neurological Society, and founder of the Society for Neurovascular Surgery. He was a member of the New Jersey Neurological Society, the Medical Society of New Jersey, the Society of Surgeons of New Jersey, the Pan American Medical Association, the Congress of Neurological Surgeons, the Mid-Atlantic Neurosurgical Society, the Philadelphia Neurosurgical Society, the New York Neurosurgical Society, and several other organizations. Dr. Strenger was past surgical vice-president and treasurer of Atlantic-Cape May Health Services, and was a founding member of the South Shore Health Plan for Atlantic-Cape May MRI. He was appointed to the New Jersey Emergency Medical Task Force and the Joint Council of State Neurosurgical Societies of which he was past chairman of the Northeast quadrant. From 1957 to 1959, Dr. Strenger was a United States Air Force captain, serving as physician and assistant chief of surgical services at Lockbourne Air Force Base. He was a member of our Atlantic County component and of the AMA.

DON'T PLAY DOCTOR WITH YOUR INSURANCE.

Just as you wouldn't want a patient to "play doctor" and self-prescribe too little, too much, or the wrong kind of medicine, we don't want you to play doctor with your insurance.

Protecting your practice, your family, your home and your lifestyle are as important to us as they are to you. As Administrator of these **Medical Society of New Jersey** Endorsed Plans, we're happy to help you with your insurance needs:

**Disability Income, Umbrella Major Medical,
Comprehensive Hospitalization-Major Medical,
Hospital Cash Allowance, and High Limit Accident**
by Nationwide Life Insurance

Term Life Insurance
by Nationwide, Principal and Occidental

Group Keogh Plans
by Prudential and Nationwide

Professional Overhead Expense
by National Casualty Company (a Nationwide Company)

Serving Professionals for Over 60 Years

A better alternative for hypertensives who are going bananas...

Spare your patients the extra cost—
in calories, sodium and dollars.

Spare your patients the rigors of
dietary K⁺ supplementation.

DYAZIDE[®]

25mg Hydrochlorothiazide/50mg Triamterene/5KF

**Effective antihypertensive*
therapy...without
the bananas**

**DAW
'DYAZIDE' AS WRITTEN.**

* Not for initial therapy. See brief summary.

Before prescribing, see complete
prescribing information in
SK&F CO. literature or PDR.
The following is a brief summary.

WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or

without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin [ACTH]). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The

following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitals intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should it develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to or potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances; postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, sialadenitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak[™] unit-of-use bottles of 100.

THEO-DUR[®]

THEOPHYLLINE (Anhydrous)

Sustained Action Tablets

INDICATIONS: THEO-DUR is indicated for relief and/or prevention of symptoms of asthma and for reversible bronchospasm associated with chronic bronchitis and emphysema.

CONTRAINDICATIONS: THEO-DUR is contraindicated in individuals who have shown hypersensitivity to theophylline or any of the tablet components.

WARNINGS: Status asthmaticus should be considered a medical emergency and is defined as that degree of bronchospasm which is not rapidly responsive to usual doses of conventional bronchodilators. Optimal therapy for such patients frequently requires both *additional medication*, parenterally administered, and *close monitoring*, preferably in an intensive care setting.

Although increasing the dose of theophylline may bring about relief, such treatment may be associated with toxicity. The likelihood of such toxicity developing increases significantly when the serum theophylline concentration exceeds 20 mcg/ml. Therefore, determination of serum theophylline levels is recommended to assure maximal benefit without excessive risk.

Serum levels above 20 mcg/ml are rarely found after appropriate administration of recommended doses. However, in individuals in whom theophylline plasma clearance is reduced for *any reason*, even conventional doses may result in increased serum levels and potential toxicity. Reduced theophylline clearance has been documented in the following readily identifiable groups: 1) patients with impaired renal or liver function; 2) patients over 55 years of age, particularly males and those with chronic lung disease; 3) those with cardiac failure from any cause; 4) neonates; and 5) those patients taking certain drugs (macrolide antibiotics and cimetidine). Decreased clearance of theophylline may be associated with either influenza immunization or active infection in the above individuals. Less serious signs of theophylline toxicity (i.e. nausea and restlessness) may occur frequently when initiating therapy, but are usually transient; when such signs are persistent during maintenance therapy, they are often associated with serum concentrations above 20 mcg/ml. Unfortunately, however, serious side effects such as ventricular arrhythmias, convulsions or even death may appear as the first sign of toxicity without any previous warning. Stated differently: *serious toxicity is not reliably preceded by less severe side effects*.

Many patients who require theophylline may exhibit tachycardia due to their underlying disease process so that the cause/effect relationship to elevated serum theophylline concentrations may not be appreciated.

Theophylline products may cause dysrhythmia and/or worsen pre-existing arrhythmias and any significant change in rate and/or rhythm warrants monitoring and further investigation.

The occurrence of arrhythmias and sudden death (with histological evidence of necrosis of the myocardium) has been recorded in laboratory animals (monkeys, rodents and dogs) when theophylline and beta agonists were administered concomitantly, although not when either was administered alone. The significance of these findings when applied to human usage is currently unknown.

PRECAUTIONS: THEO-DUR TABLETS SHOULD NOT BE CHEWED OR CRUSHED.

General: Theophylline half-life is shorter in smokers than in non-smokers. Therefore, smokers may require larger or more frequent doses. Morphine and curare should be used with caution in patients with airway obstruction as they may suppress respiration and stimulate histamine release. Alternative drugs should be used when possible. Theophylline should not be administered concurrently with other xanthine medications. Use with caution in patients with severe cardiac disease, severe hypoxemia, hypertension, hyperthyroidism, acute myocardial injury, cor pulmonale, congestive heart failure, liver disease, in the elderly (especially males) and in neonates. In particular, great caution should be used in giving theophylline to patients with congestive heart failure. Frequently, such patients have markedly prolonged theophylline serum levels with theophylline persisting in serum for long periods following discontinuation of the drug. Individuals who are rapid metabolizers of theophylline, such as the young, smokers, and some non-smoking adults, may not be suitable candidates for once-daily dosing. These individuals will generally need to be dosed at 12 hour or sometimes 8 hour intervals. Such patients may exhibit symptoms of bronchospasm near the end of a dosing interval, or may have wider peak-to-trough differences than desired.

Use theophylline cautiously in patients with history of peptic ulcer. Theophylline may occasionally act as a local irritant to the G.I. tract although gastrointestinal symptoms are more commonly centrally mediated and associated with serum drug concentrations over 20 mcg/ml.

Information for Patients: The physician should reinforce the importance of taking only the prescribed dose and time interval between doses. THEO-DUR tablets should not be chewed or crushed. When dosing THEO-DUR on a once daily (q24h) basis, tablets should be taken whole and not split. As with any controlled-release theophylline product, the patient should alert the physician if symptoms occur repeatedly, especially near the end of the dosing interval.

DRUG INTERACTIONS: Drug-Drug: Toxic synergism with ephedrine has been documented and may occur with some other sympathomimetic bronchodilators. In addition, the following drug interactions have been demonstrated:

Drug	Effect
Theophylline with lithium carbonate	Increased excretion of lithium carbonate
Theophylline with propranolol	Antagonism of propranolol effect
Theophylline with cimetidine	Increased theophylline blood levels
Theophylline with troleandomycin, erythromycin	Increased theophylline blood levels

Drug-Food: THEO-DUR 100 mg Sustained Action Tablets have not been adequately studied to determine whether their bioavailability is altered when given with food. Available data suggest that drug administration at the time of food ingestion may influence the absorption characteristics of theophylline controlled-release products resulting in serum values different from those found after administration in the fasting state.

A drug-food effect, if any, would likely have its greatest clinical significance when high theophylline serum levels are being maintained and/or when large single doses (greater than 13 mg/kg or 900 mg) of a controlled-release theophylline product are given.

THEO-DUR (200, 300, and 450 mg) Sustained Action Tablets: The rate and extent of absorption of theophylline from THEO-DUR 200 mg, 300 mg, and 450 mg tablets when administered fasting or immediately after a moderately high fat content breakfast is similar.

Drug-Laboratory Test Interactions: When plasma levels of theophylline are measured by spectrophotometric methods, coffee, tea, cola beverages, chocolate, and acetaminophen contribute falsely high values.

Carcinogenesis, Mutagenesis, and Impairment of Fertility: Long-term animal studies have not been performed to evaluate the carcinogenic potential, mutagenic potential, or the effect on fertility of xanthine compounds.

Pregnancy: Category C—Animal reproduction studies have not been conducted with theophylline. It is not known whether theophylline can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Xanthines should be given to a pregnant woman only if clearly needed.

Nursing Mothers: It has been reported that theophylline distributes readily into breast milk and may cause adverse effects in the infant. Caution must be used if prescribing xanthine to a mother who is nursing, taking into account the risk/benefit of this therapy.

Pediatric Use: Safety and effectiveness of THEO-DUR administered:

1. Every 24 hours in children under 12 years of age, have not been established
2. Every 12 hours in children under 6 years of age, have not been established

ADVERSE REACTIONS: The most consistent adverse reactions are usually due to overdose and are:

1. *Gastrointestinal:* nausea, vomiting, epigastric pain, hematemesis, diarrhea
2. *Central nervous system:* headaches, irritability, restlessness, insomnia, reflex hyperexcitability, muscle twitching, clonic and tonic generalized convulsions
3. *Cardiovascular:* palpitation, tachycardia, extrasystoles, flushing, hypotension, circulatory failure, ventricular arrhythmias
4. *Respiratory:* tachypnea
5. *Renal:* albuminuria, increased excretion of renal tubular and red blood cells, potentiation of diuretics.
6. *Other:* rash, hyperglycemia and inappropriate ADH syndrome.

OVERDOSEAGE: Management: If potential oral overdose is established and seizure has not occurred

- A. Induce vomiting.
 - B. Administer a cathartic (this is particularly important if sustained-release preparations have been taken).
 - C. Administer activated charcoal.
- If patient is having a seizure
- A. Establish an airway.
 - B. Administer oxygen.
 - C. Treat the seizure with intravenous diazepam, 0.1 to 0.3 mg/kg up to 10 mg.
 - D. Monitor vital signs, maintain blood pressure and provide adequate hydration.

Post Seizure Care:

- A. Maintain airway and oxygenation.
- B. If a result of oral medication, follow above recommendations to prevent absorption of the drug, but intubation and lavage will have to be performed instead of inducing emesis, and the cathartic and charcoal will need to be introduced via a large bore gastric lavage tube.
- C. Continue to provide full supportive care and adequate hydration while waiting for drug to be metabolized. In general, the drug is metabolized sufficiently rapid so as not to warrant consideration of dialysis, however, if serum levels exceed 50 mcg/ml charcoal hemoperfusion may be indicated.

CAUTION: Federal law prohibits dispensing without prescription. For full prescribing information, see package insert. Revised 6/87

THE MEDICAL SOCIETY OF NEW JERSEY

VOLUME 56

BLUE CROSS AND BLUE SHIELD Participation

Q. What does participation mean?

A. Participation means that a physician has signed an agreement with Blue Cross and Blue Shield of New Jersey (BCBSNJ), and has agreed to accept BCBSNJ payment as payment-in-full for covered services rendered to subscribers under the following circumstances:

- For patients who are covered under fixed fee schedules, (500 series, 750 series, 14/20 series) and qualify for service benefits by meeting certain income requirements. For example, in order for BCBSNJ payment to be considered payment-in-full under the 14/20 series program, the subscriber's gross annual income from all sources would have to be \$14,000 or less for a single, unmarried subscriber, \$20,000 for all other situations. (Income levels for the 500 Series are \$6,000 single and unmarried, \$8,500 for all others. Similarly, 750 Series income levels are \$7,500 and \$12,000). It is the subscriber's responsibility to notify the physician that he/she is under income, and must provide proof of income if requested by the physician.
- For patients who are covered under the paid-in-full reasonable and customary (R & C) program (P.A.C.E., MEDALLION, UCR coverages), regardless of income.

Q. What are the advantages of participation?

A. BCBSNJ pays participating physicians directly for services rendered (except when patients pay you or for Medicare supplementary payments when you do not take assignment). Also, many BCBSNJ patients have major medical contracts which can pay participating physicians supplemental amounts directly after fixed fee payments are made. By receiving direct reimbursement, participating physicians enjoy reduced collection and billing expenses overall. BCBSNJ also promotes the use of participating physicians to its subscribers. It publishes a "Who's Blue" book for its large group customers, and provides the names of participating physicians to subscribers who call a toll-free referral number. BCBSNJ also works directly with its large group customers to advise them of participating physicians in the area where their members live and work. Patients covered by BCBSNJ's new MEDALLION

coverage are especially likely to use participating physicians.

Q. What are the disadvantages of participation?

A. Depending on your fees, BCBSNJ's reasonable and customary allowances may not, in some cases, equal your charge. Yet, as a participating physician, you would have to accept the R & C allowance as payment-in-full. With fee schedule contracts, if a patient proves to you that he/she is "under income," you would have to accept BCBSNJ's fixed fee payment as payment-in-full. While this situation occurs infrequently, the write-off on a case can be significant.

Q. Many patients are still covered, though, by 14/20 Series and other fixed fee contracts. Does BCBSNJ continue to sell these contracts?

A. BCBSNJ no longer sells the fixed fee contracts to its group customers. It is expected that all fixed fee contracts for existing group and individual subscribers will be phased out by the early 1990s, to be replaced with coverages like P.A.C.E. and MEDALLION.

Q. How are fee allowances determined for the reasonable and customary (R & C) program (P.A.C.E., MEDALLION coverages)?

A. BCBSNJ reviews actual charges from claim forms received throughout the year. Each CPT-4 procedure code is reviewed for charges submitted by each physician specialty within three geographic areas of New Jersey, which generally correspond to southern, central, and northern New Jersey. Maximum R & C allowances are determined based upon these charge data. There are no individual physician profiles.

Q. If I become participating and later want to resign, what must I do, and when will my resignation be effective?

A. A physician may cancel the participating agreement by giving BCBSNJ 30 days written notice. The participating agreement will still apply, however, to any BCBSNJ subscriber contract that currently is in force until the end of the subscriber's contract year. Since the subscription contracts are renewed every 12 months and subscribers have different effective dates, it may take one year before the resignation is fully in effect.

Q. Must I sign a separate agreement for MEDALLION?

A. No. MEDALLION is a traditional health insurance program that covers a variety of services such

PREADMISSION CERTIFICATION/UTILIZATION REVIEW ORGANIZATIONS

At this time, the following utilization review organizations are certified by the New Jersey State Department of Health to conduct inpatient reviews on nonfederal cases. The organizations which have an asterisk indicate an insurance company authorized by

the Department of Insurance to perform preadmission certification.

They are the only legally recognized organizations in New Jersey and their addresses are supplied for your assistance:

The Peer Review Organization of New Jersey, Inc.

as office visits, unlimited lab, x-ray, and well-child care. Payments are made via the R & C allowances previously discussed.

Q. How many physicians in New Jersey participate?

A. Blue Cross and Blue Shield currently has participating agreements with 9,218 M.D.s in New Jersey.

Q. Do physicians have input into BCBSNJ decisions about the kinds of medical-surgical services that are eligible for reimbursement? How about new procedures and technologies?

A. BCBSNJ several years ago formed the Multi-Specialty Advisory Committee, commonly referred to as MAC. The MAC is comprised of physician representatives nominated by specialty societies within New Jersey. The MAC reviews and considers medical-surgical issues and procedures, and makes recommendations to BCBSNJ's Professional Advisory Committee, which reports directly to the BCBSNJ Board of Directors.

CARRIER FOUNDATION

Pharmacological Research on Anti-Anxiety Agents

The research department at the Carrier Foundation, Belle Mead, is conducting a study to evaluate the effects of a concurrent administration schedule for replacing benzodiazepine use with buspirone, a nonaddictive anti-anxiety compound. Individuals who have been taking either alprazolam (Xanax®), diazepam (Valium®), or lorazepam (Ativan®), for the treatment of anxiety for 3 to 36 months are needed to participate in this study. Eligible individuals will receive a physical examination, laboratory tests, medication, and weekly assessment sessions, free of charge. Confidentiality will be strictly maintained. Bradley D. Evans, M.D., director of addiction recovery services, and Helen M. Pet-

tinati, Ph.D., director of research, will supervise the study. For more information about this program or to refer eligible individuals, contact Hugh Smith, at 201-874-4000, extension 4396.

INTERNATIONAL TELEPHONE Disease Control

A disposable telephone is being offered in the patient's admission kit as a measure to control cross infections in hospitalized patients, by International Telephone Inc. For further information, call 201/387-7767.

Clues and Warning Signs of Suicide in the Elderly

Verbal Clues

- I'm going to kill myself.
- I'm going to commit suicide.
- I'm going to end it all.
- I want to end it all.
- I just want out.
- You would be better off without me.

Behavioral Clues

- Donating body to a medical school.
- Purchasing a gun.
- Stockpiling pills.
- Putting personal and business affairs in order.
- Making or changing a will.
- Taking out insurance or changing beneficiaries.
- Making funeral plans.
- Giving away money and/or possessions.
- Changes in behavior, especially episodes of screaming or hitting, throwing things, or failure to get along with family, friends, or peers.
- Suspicious behavior, for example, going out at

odd times of the day or night, waving or kissing goodbye (if not characteristic).

- Sudden interest or disinterest in church and religion.
- Scheduling of appointment with doctor for no apparent physical cause or very shortly after the last visit to the doctor.
- Loss of physical skills, general confusion, or loss of understanding, judgment, or memory.

Situational Clues

- Recent move.
- Death of a spouse.
- Diagnosis of terminal illness.
- Flare-up with relative or close friend.

Symptoms of Late-Life Depression

- Change in sleep patterns, particularly insomnia.
- Change in eating patterns, especially loss of appetite.
- Weight loss.
- Extreme fatigue.
- Increased concern with bodily functions (e.g., frequent complaints of constipation, loose bowels, aches and pains, dizziness, increased heart rate).
- Change in mood, particularly if listless, apathetic, angry, hostile, nervous, irritable, depressed, sad, or withdrawn.
- Expression of fears and anxieties, without any reason.

- Low self-esteem or self-concept, feelings of worthlessness, pessimism.

Warning Signs of Alcoholism in the Elderly

- Increase in amount of alcohol or number of alcoholic drinks taken.
- Behavioral manifestations of anger, hostility, belligerence.
- Odor of alcohol on breath, especially in the morning.
- Flushed face.
- Trembling and the 'shakes'.
- Blackout periods.
- Hangovers.
- Alcoholic hepatitis, cirrhosis, chronic gastritis.
- Drinking in spite of medical admonitions against alcohol use.
- Problems with family members, friends, or relatives.
- Inability to do simple tasks, confusion, slurred speech, or retarded motor skills.
- Inability to conduct normal everyday tasks without drinking.
- Financial problems related to alcohol use.

CLARK MARTIN*

Struggling with Auto Insurance; PAs Raise Fuss

STRUGGLING WITH AUTO INSURANCE

"But in this world nothing can be said to be certain, except death and taxes."—Benjamin Franklin

If Ben Franklin were living in New Jersey today, he'd probably add "high auto insurance premiums" to his short list of life's certainties.

Will premiums ever drop? For years, the Legislature has struggled to reduce premiums, assure that drivers have adequate coverage, and guarantee injured parties the right to sue for pain and suffering. Apparently, the goals are mutually exclusive.

Nevertheless, the effort goes on. Stung by a new state-mandated insurance surcharge averaging \$100, legislative leaders announced that both houses will go into "continuous session" this summer to forge a solution.

Obviously, medicine has a stake in this. One proposal under consideration is the repeal of Personal Injury Protection coverage (PIP), the only true "no-fault" feature of New Jersey's no-fault auto insurance system. PIP pays an injured driver's hospital and physician bills regardless of who caused the accident. If PIP is repealed, these expenses would have to be covered by an employee's health insurance—an idea strongly opposed by the business lobbies—or would be left largely unpaid until lawsuits are settled.

Also under consideration (for the umpteenth time) is enactment of a medical fee schedule, which might lower the amount of premium attributable to PIP by a minuscule amount. The critical issue here is whether

a fee schedule feature in the law would permit balance billing.

These medical issues have been overshadowed in the media by the endless debate over the lawsuit threshold, meaning driver A can sue driver B for pain and suffering after driver A's medical bills exceed a given amount.

Governor Kean and a number of Assembly leaders are calling for a "verbal threshold," meaning that driver A can sue driver B only after driver A can prove he has suffered a permanent, serious injury. The theory is that a verbal threshold would produce fewer lawsuits, so premiums would at least stabilize, if not fall.

A "verbal threshold" was passed in the Assembly in the last session, but was voted down both by Republicans and Democrats in the Senate.

The Society has taken no position on the lawsuit threshold, and for good reason. It is not a medical issue. When and if a patient can sue somebody else for pain and suffering is not our concern; in contrast, PIP and the fee schedule are legitimate medical issues.

Nevertheless, as New Jersey residents and drivers, physicians are as entitled as anyone else to have an opinion about the lawsuit threshold. Our only request is this: If you communicate with a legislator about this aspect of auto insurance, please make it clear that you are expressing a personal opinion and not a Medical Society position.

PAs RAISE FUSS

Stunned by the Assembly's passage of a bill which would block their effort to force the Board of Medical Examiners to license them, physician assistants have mounted a vigorous public relations campaign against the bill.

A-1591, which passed in the lower house in February, would prohibit any state agency from licensing or otherwise allowing a category of health care professionals to practice unless first authorized by statute. PA licensing bills have failed in the Legislature numerous times in the past ten years.

Striking at the bill, the State Society of Physician Assistants has coupled visits to the editorial boards of major daily and weekly newspapers with a vigorous letters-to-the-editor writing campaign.

Numerous pro-PA editorials and articles have resulted. Their recurring theme is that New Jersey is an "odd duck" because it is the only state that does not permit PAs to practice, passage of A-1591 would prevent PAs from ever working here, and PAs would provide accessible, high-quality, cost-effective health care to all citizens.

Of these arguments, the fact that New Jersey stands alone does attract attention and arouse curiosity. But the claim that passage of A-1591 would forever prevent PAs from working here bears closer examination.

Absent enactment of A-1591, it is still doubtful that the Medical Examiners would license PAs by regulation. The Board has indicated that current law does not give it the authority to create licenses. That being so, only the Legislature can decide the question—which is precisely the point of A-1591.

**Kidney stones show up in
some hard-to-reach places.**

**Luckily, the New Jersey
Kidney Stone
Treatment Center
is easy to get to.**

You shouldn't have to go out of your way for lithotripsy services to complement your practice.

The New Jersey Kidney Stone Treatment Center is centrally located in New Brunswick, New Jersey, near statewide highways, for easy access for you and your patients.

The Center is equipped with the latest Dornier HM4 "tubless" lithotripter, which eliminates the need for a water bath. That means easier patient handling, and greater patient comfort.

And the Center is located at a major academic medical center, with full medical back-up. Patients are treated on an outpatient or inpatient basis.

Any board-eligible or board-certified urologist who has completed the ESWL training course and is licensed in the State of New Jersey may apply for privileges at the Center.

Physicians may also refer their patients to the Center for treatment by a member of our medical staff. After the procedure, patients are referred back to their own urologists for follow-up care.

For a credentialing package, or for more information about lithotripsy, call Center Director Diane DiGiulio at 1-800-542-8887, 8 a.m.-5 p.m., Monday-Friday.

New Jersey Kidney Stone Treatment Center

Located at Robert Wood Johnson University Hospital
One Robert Wood Johnson Place
New Brunswick, New Jersey 08901

The New Jersey Kidney Stone Treatment Center is operated by Health Horizons, (ESWL), L.P., affiliated with the following hospitals: Community Memorial Hospital, Freehold Area Hospital, Helene Fuld Medical Center, Jersey Shore Medical Center, Raritan Bay Medical Center, Riverview Medical Center, Robert Wood Johnson University Hospital, St. Francis Medical Center, St. Peter's Medical Center, Somerset Medical Center.

Medical Errors

***Retesting Physicians for Relicensure;
Judges Support Changes in Malpractice
Dispute Resolution System; AIDS
Malpractice Verdict***

RETESTING PHYSICIANS FOR RELICENSURE

Acting at the expressed direction of Governor Mario Cuomo, an advisory committee of the New York State Board of Regents has issued a report calling for reexamination of all physicians every nine years as a prerequisite for licensure renewal. The Board now must decide whether to impose the regulations. If it does, New York will become the first state to regularly recheck all of its physicians.

Physicians could seek relicensure in one of several ways: take an examination, undergo peer review, have their patient records evaluated, or obtain recertification from a specialty board.

There are 50,000 physicians licensed in New York. The proposed program, favored by the governor, would be designed to assure that physicians stay current educationally. Those found deficient would have to take steps to correct shortcomings or lose their licenses.

Indications are that the proposal stands a good chance of being adopted. Said the Board in its report: "The goal of the recredentialing process is the prevention of medical errors." The American Medical Association has expressed some reservations. (*Medical Liability Monitor*, March 29, 1988, Vol. 13, Number 3)

JUDGES SUPPORT CHANGES IN MALPRACTICE DISPUTE RESOLUTION SYSTEM

Advocates of professional liability tort reform may find unexpected support from an untapped source—American judges. In the first national study of judicial views on the handling of medical malpractice, commissioned in 1987 by the American College of Obstetri-

cians and Gynecologists, some rather surprising findings emerged:

- Of federal and state judges, 84 percent favors use of court-appointed impartial expert witnesses. (And, 84 percent favors use of an impartial witness agreed upon by both parties; 58 percent favors use of a court-appointed expert witness selected from a predetermined list.)

- The public would be better served if incentives were provided to encourage early settlement of cases, believes 84 percent.

- Changes in collateral source rules to subtract amount received from health insurance, worker's compensation, and other sources, from malpractice awards, are endorsed by 55 percent.

- Periodic payments of awards above certain amounts are supported by 49 percent.

A smaller percentage (44 percent) favors the use of arbitration as a means of resolving malpractice suits.

While the 338 randomly selected state and federal judges voiced quite substantial support for changes that would make the present malpractice claims disposition process fairer and more efficient, the majority of these respondents opposed changes that would eliminate any of the elements in the present civil justice system. For example: 53 percent opposes caps on noneconomic awards; 78 percent opposes a shortened statute of limitations for minors; 65 percent opposes elimination of punitive damages; and 75 percent opposes changing the burden of proof to clear and convincing.

The telephone survey, conducted by Penn & Schoen Associates, Inc., New York City, from August 5 to 19, 1987, was reported in the March 1987 issue of *Obstetrics and Gynecology*. An accompanying editorial, written by Keith White, M.D., and Kenneth Heland, J.D., of the ACOG staff, called attention to a 1987 Harris Poll indicating substantial public support for similar changes favored by judges in the present malpractice system.

"We can see broad agreement in several segments of society that something should be done to improve the legal system under which we operate," the authors said.

Although White and Heland said it was encouraging to see such support, "Our enthusiasm for change has to be tempered by what appears to be possible. Our efforts should be directed toward improving the efficiency and fairness of the system for all participants. If efforts to improve the system are perceived as an attempt merely to get the physicians "off the hook," they probably will not succeed. But if we genuinely try to change the system for the general good, we will find allies in the judiciary and among the public at large." (*Medical Liability Monitor*, March 29, 1988, Vol. 13, Number 3)

AIDS MALPRACTICE VERDICT

A \$750,000 judgment handed down in the nation's first AIDS-based malpractice case may soon be appealed by the Cambridge, Massachusetts internist who

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department, and Director of Special Projects.

lost the case in Middlesex County superior court.

The jury's message was that primary care physicians will be in "deep trouble" if they "resort to a psychiatric diagnosis before performing diagnostic testing to confirm or rule out physical cause," said the plaintiff's attorney.

In January, the jury found against the internist who works for the Harvard Community Health Plan, a large HMO, for failing, in 1985, to diagnose *Pneumocystis carinii* pneumonia in a woman found to have antibodies to human immunodeficiency virus. In her lawsuit, the plaintiff, a former insurance company claims supervisor, maintained that the physician's missed diagnosis had led to permanent pulmonary damage.

The defendant treated the plaintiff between May and September of that year for chest pains, shortness of breath, and a persistent dry cough—which he attributed to bronchitis and asthma. In August, the 32 year-old woman learned at a blood bank that she had antibodies to HIV. The plaintiff told the defendant about the test result, but on the basis of a clear chest x-ray and physical examination, he stuck by his original diagnosis. He prescribed antibiotics, cough medicine, and a bronchial inhaler.

The plaintiff's symptoms persisted, and she testified that the defendant said anxiety about the HIV test result was making her asthma worse.

In late September, the defendant referred her to a pulmonary consultant for bronchoscopy. He said he had been reluctant to order the test, which several physician witnesses testified is definitive, for PCP, because "it has a number of risks."

As it happened, the plaintiff became so ill before her scheduled appointment with the pulmonologist that she went to the emergency rooms at Mount Auburn Hospital and Boston City Hospital. At Boston City Hospital, the pneumonia diagnosis was made on the basis of a sputum culture and a bronchial wash, and she was admitted and treated with trimethoprim-sulfamethoxazole for eight weeks.

Since being discharged, the plaintiff testified, she has been unable to work or to carry out her normal household duties as the mother of two boys, aged 7 and 13.

The jury awarded the plaintiff \$500,000 for past and future medical expenses, pain, suffering, and damages, plus another \$250,000 to her sons.

Extensive and often contradictory testimony from ten physicians centered on what was known about AIDS in 1985 and what constituted standards of care in the community. The witnesses raised a number of questions about perceptions of risk, physicians' reluctance to panic their patients, and the use of diagnostic tests in an HMO setting.

The plaintiff believes she contracted AIDS from a former lover who used intravenous (IV) drugs. In 1985, the few AIDS patients treated by Harvard Community Health Plan physicians primarily were gay men, according to a plan spokesman. Female sexual partners of male IV drug abusers did not have the high profile they have today and "at that time, the plaintiff was not

considered to be in one of the high-risk groups," he said.

The plaintiff's testimony attorney argued that heterosexual transmission was well known in 1985 and that the plaintiff should have been seen as being at high risk because three years earlier she had contracted rectal gonorrhea from the same IV drug-using partner. That episode was noted in her chart by the nurse-practitioner who treated her. The defendant did not re-examine her sexual history when he learned of her positive HIV test.

The plaintiff's route of infection was clinically irrelevant, according to a Belmont internist who testified on the defendant's behalf. "The physicians who took care of her knew that she carried the AIDS virus. The question was whether she was sick enough to require bronchoscopy before she came down with a florid pneumonia."

The defendant's internist expert said it would be unreasonable to perform an invasive test like bronchoscopy on every patient who had the plaintiff's symptoms plus a history of asthma and heavy smoking, even if they also were HIV antibody-positive. Harvard Community Health Plan's spokesman concurred, saying, "The defendant was an internist in a setting where he saw a large number of people with symptoms that were similar to the plaintiff's, but that obviously were not related to AIDS or pneumocystis."

The plaintiff's attorney contends that the defendant could have made the diagnosis with arterial blood gas testing or a gallium scan. He also argued during the trial that the HMO guidelines for assessing physician performance pressured physicians "not to let hysteria over malpractice cause them to perform unnecessary, expensive tests."

The attorney also entered as evidence several pre-1985 articles from *The New England Journal of Medicine* and the *Journal of the American Medical Association* which recommended that PCP be "immediately ruled out or confirmed" in patients with "known or suspected AIDS."

The Belmont internist recalls that in 1985, the CDC estimated that perhaps only 10 to 20 percent of HIV antibody-positive people would actually develop AIDS. "As primary physicians, we were being told not to alarm these patients," he said.

Moreover, he thinks the defendant's diagnosis made sense because the plaintiff had two normal chest x-rays and at the time physicians did not know that "about 5 percent of those with pneumocystis have clear chest x-rays."

"The diagnosis in this case was not simple," he emphasized. In his opinion, the defendant acted according to the "medical standards of the average internist in practice in this area."

"Times have changed since 1985. Today a patient like the plaintiff would be worked up quickly. Most physicians know they have got to look for opportunistic infections aggressively when they see an HIV-positive patient," claimed the Belmont internist. (Patricia Thomas, *Medical World News*, March 28, 1988)

SLOW-K

The World's Most Popular K*

Slow-K[®]
potassium chloride
slow-release tablets
8 mEq (600 mg)

It means "dependability" in almost any language

*Based on worldwide sales data on file, CIBA Pharmaceutical Company.
Capsule or tablet slow-release potassium chloride preparations should be reserved for patients who cannot tolerate, refuse to take, or have compliance problems with liquid or effervescent potassium preparations because of reports of intestinal and gastric ulceration and bleeding with slow-release KCl preparations.

Before prescribing, please consult Brief Prescribing Information on next page.

The World's Most Popular K

For good reasons

- **It works**—a 12-year record of efficacy¹
- **It's safe**—unsurpassed by any other KCl tablet or capsule^{2*}
- **It's acceptable vs liquids**—greater palatability, fewer GI complaints, lower incidence of nausea²
- **It's comparable to 10 mEq**—in low-dosage supplementation^{3†}
- **It's economical**—less expensive than all other leading KCl slow-release supplements on a per tablet cost to the patient¹

Slow-K®
potassium chloride
slow-release tablets 8 mEq (600 mg)

For patients who can't or won't tolerate liquid KCl.

*The most common adverse reactions to potassium salts are gastrointestinal side effects.

†Pooled mean serum potassium following oral administration of 30 mEq K-Tab compared to 24 mEq Slow-K in diuretic-treated hypertensives (n = 20) over 8 weeks.

potassium chloride USP
Slow-Release Tablets
8 mEq (600 mg)

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE INSERT)

INDICATIONS AND USAGE

BECAUSE OF REPORTS OF INTESTINAL AND GASTRIC ULCERATION AND BLEEDING WITH SLOW-RELEASE POTASSIUM CHLORIDE PREPARATIONS, THESE DRUGS SHOULD BE RESERVED FOR THOSE PATIENTS WHO CANNOT TOLERATE OR REFUSE TO TAKE LIQUID OR EFFERVESCENT POTASSIUM PREPARATIONS OR FOR PATIENTS IN WHOM THERE IS A PROBLEM OF COMPLIANCE WITH THESE PREPARATIONS.

1. For therapeutic use in patients with hypokalemia with or without metabolic alkalosis; in digitalis intoxication and in patients with hypokalemic familial periodic paralysis.
2. For prevention of potassium depletion when the dietary intake of potassium is inadequate in the following conditions: patients receiving digitalis and diuretics for congestive heart failure; hepatic cirrhosis with ascites; states of aldosterone excess with normal renal function; potassium-losing nephropathy; and certain diarrheal states.
3. The use of potassium salts in patients receiving diuretics for uncomplicated essential hypertension is often unnecessary when such patients have a normal dietary pattern. Serum potassium should be checked periodically, however, and if hypokalemia occurs, dietary supplementation with potassium-containing foods may be adequate to control milder cases. In more severe cases supplementation with potassium salts may be indicated.

CONTRAINDICATIONS

Potassium supplements are contraindicated in patients with hyperkalemia, since a further increase in serum potassium concentration in such patients can produce cardiac arrest. Hyperkalemia may complicate any of the following conditions: chronic renal failure, systemic acidosis such as diabetic acidosis, acute dehydration, extensive tissue breakdown as in severe burns, adrenal insufficiency, or the administration of a potassium-sparing diuretic (e.g., spironolactone, triamterene) (see OVERDOSAGE).

All solid dosage forms of potassium supplements are contraindicated in any patient in whom there is cause for arrest or delay in tablet passage through the gastrointestinal tract. In these instances, potassium supplementation should be with a liquid preparation. Wax-matrix potassium chloride preparations have produced esophageal ulceration in certain cardiac patients with esophageal compression due to an enlarged left atrium.

WARNINGS

Hyperkalemia (See OVERDOSAGE).

In patients with impaired mechanisms for excreting potassium, the administration of potassium salts can produce hyperkalemia and cardiac arrest. This occurs most commonly in patients given potassium by the intravenous route but may also occur in patients given potassium orally. Potentially fatal hyperkalemia can develop rapidly and be asymptomatic.

The use of potassium salts in patients with chronic renal disease, or any other condition which impairs potassium excretion, requires particularly careful monitoring of the serum potassium concentration and appropriate dosage adjustment.

Interaction With Potassium-Sparing Diuretics

Hypokalemia should not be treated by the concomitant administration of potassium salts and a potassium-sparing diuretic (e.g., spironolactone or furosemide), since the simultaneous administration of these agents can produce severe hyperkalemia.

Gastrointestinal Lesions

Potassium chloride tablets have produced stenotic and/or ulcerative lesions of the small bowel and deaths. These lesions are caused by a high localized concentration of potassium ion in the region of a rapidly dissolving tablet, which injures the bowel wall and thereby produces obstruction, hemorrhage, or perforation. Slow-K is a wax-matrix tablet formulated to provide a controlled rate of release of potassium chloride and thus to minimize the possibility of a high local concentration of potassium ion near the bowel wall. While the reported frequency of small-bowel lesions is much less with wax-matrix tablets (less than one per 100,000 patient-years) than with enteric-coated potassium chloride tablets (40-50 per 100,000 patient-years) cases associated with wax-matrix tablets have been reported both in foreign countries and in the United States. In addition, perhaps because the wax-matrix preparations are not enteric-coated and release potassium in the stomach, there have been reports of upper gastrointestinal bleeding associated with these products. The total number of gastrointestinal lesions remains approximately one per 100,000 patient-years. Slow-K should be discontinued immediately and the possibility of bowel obstruction or perforation considered if severe vomiting, abdominal pain, distention, or gastrointestinal bleeding occurs.

Metabolic Acidosis

Hypokalemia in patients with metabolic acidosis should be treated with an alkalinizing potassium salt such as potassium bicarbonate, potassium citrate, or potassium acetate.

PRECAUTIONS

General:

The diagnosis of potassium depletion is ordinarily made by demonstrating hypokalemia in a patient with a clinical history suggesting some cause for potassium depletion. In interpreting the serum potassium level, the physician should bear in mind that acute alkalosis *per se* can produce hypokalemia in the absence of a deficit in total body potassium, while acute acidosis *per se* can increase the serum potassium concentration into the normal range even in the presence of a reduced total body potassium.

Information for Patients

Physicians should consider reminding the patient of the following:

- To take each dose without crushing, chewing, or sucking the tablets.
- To take this medicine only as directed. This is especially important if the patient is also taking both diuretics and digitalis preparations.
- To check with the physician if there is trouble swallowing tablets or if the tablets seem to stick in the throat.
- To check with the doctor at once if tarry stools or other evidence of gastrointestinal bleeding is noticed.

Laboratory Tests

Regular serum potassium determinations are recommended. In addition, during the treatment of potassium depletion, careful attention should be paid to acid-base balance, other serum electrolyte levels, the electrocardiogram, and the clinical status of the patient, particularly in the presence of cardiac disease, renal disease, or acidosis.

Drug Interactions

Potassium-sparing diuretics: see WARNINGS.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term carcinogenicity studies in animals have not been performed.

Pregnancy Category C

Animal reproduction studies have not been conducted with Slow-K. It is also not known whether Slow-K can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Slow-K should be given to a pregnant woman only if clearly needed.

Nursing Mothers

The normal potassium ion content of human milk is about 13 mEq/L. It is not known if Slow-K has an effect on this content. Caution should be exercised when Slow-K is administered to a nursing woman.

Pediatric Use

Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

One of the most severe adverse effects is hyperkalemia (see CONTRAINDICATIONS, WARNINGS, and OVERDOSAGE). There also have been reports of upper and lower gastrointestinal conditions including obstruction, bleeding, ulceration, and perforation (see CONTRAINDICATIONS and WARNINGS); other factors known to be associated with such conditions were present in many of these patients.

The most common adverse reactions to oral potassium salts are nausea, vomiting, abdominal discomfort, and diarrhea. These symptoms are due to irritation of the gastrointestinal tract and are best managed by taking the dose with meals or reducing the dose.

Skin rash has been reported rarely.

OVERDOSAGE

The administration of oral potassium salts to persons with normal excretory mechanisms for potassium rarely causes serious hyperkalemia. However, if excretory mechanisms are impaired or if potassium is administered too rapidly intravenously, potentially fatal hyperkalemia can result (see CONTRAINDICATIONS and WARNINGS). It is important to recognize that hyperkalemia is usually asymptomatic and may be manifested only by an increased serum potassium concentration (6.5-8.0 mEq/L) and characteristic electrocardiographic changes (peaking of T waves, loss of P wave, depression of S-T segment, and prolongation of the Q-T interval). Late manifestations include muscle paralysis and cardiovascular collapse from cardiac arrest (9-12 mEq/L).

Treatment measures for hyperkalemia include the following: (1) elimination of foods and medications containing potassium and of potassium-sparing diuretics; (2) intravenous administration of 300-500 mEq of 10% dextrose solution containing 10-20 units of insulin per 1,000 ml; (3) correction of acidosis, if present, with intravenous sodium bicarbonate; (4) use of exchange resins, hemodialysis, or peritoneal dialysis.

In treating hyperkalemia in patients who have been stabilized on digitalis, too rapid a lowering of the serum potassium concentration can produce digitalis toxicity.

DOSE AND ADMINISTRATION

The usual dietary intake of potassium by the average adult is 40-80 mEq per day. Potassium depletion sufficient to cause hypokalemia usually requires the loss of 200 or more mEq of potassium from the total body store. Dosage must be adjusted to the individual needs of each patient but is typically in the range of 20 mEq per day for the prevention of hypokalemia to 40-100 mEq or more per day for the treatment of potassium depletion. Large numbers of tablets should be given in divided doses.

Note: Slow-K slow-release tablets must be swallowed whole and never crushed, chewed, or sucked.

HOW SUPPLIED

Tablets—600 mg of potassium chloride (equivalent to 8 mEq) round, buff colored, sugar-coated (imprinted Slow-K)

Bottles of 100 NDC 0083-0165-30*

Bottles of 1000 NDC 0083-0165-40

Consumer Pack—One Unit NDC 0083-0165-65

12 Bottles—100 tablets each NDC 0083-0165-65

Complaints and Commendations

PALMA E. FORMICA, M.D.*

Letters to the president of the Medical Society of New Jersey are the focus of this first essay.

As president, I have received a flood of letters in just the past few weeks. I would like to share two of them with you.

The first letter is from a writer who was so frustrated she wrote a two-page, single-spaced essay voicing complaints about her perceptions of physician indifference toward patients. It was not the tone of the usual crank letter: her concerns are legitimate, and I promised to bring them to the attention of our membership.

What was her complaint? Waiting to see doctors:

An appointment card carries both the doctor's and the patient's name. Yet too many doctors—women as well as men—see that appointment as binding only the patient. The moral contract implied by the appointment is violated repeatedly by too many doctors. It's a way for doctors to keep their options open while closing out the patient's options. The practice shows a contemptuous disregard for the value of the patient's time.

In these days of really serious problems facing the profession, why should I even consider such a triviality? Practice management consultants consider this

to be the number one complaint among patients. Even one of our legislators voiced the same complaints.

Tom Peters in *Search for Excellence* points out that the most successful companies in America concentrate on customer satisfaction; our "customers" are our patients.

We worry about our professional image and the lack of respect the public shows us. Isn't it time we look at some of those criticisms to see how we can remedy this perception. Public relations begins in our offices.

Who among us is not guilty of keeping patients waiting at some time or another. When it is the routine and not the exception, then we have a problem. Do we call our reception area the "waiting room" even when most of us work by appointments? Are not delays to be expected? Is this not the modus operandi of physicians?

It has been said, "A full waiting room means the doctor is either good or cheap." Do we delude ourselves into thinking that we are so good and so busy that our patients do not mind waiting? Studies have shown that most people will not complain about a 20-minute wait, but anger and frustration increase as each minute slips away. Keeping people waiting, when the wait can be avoided, is discourteous and bad business, to say the least. In these days of increased competition and urgicenters advertising "no waiting," indications are that people hate to wait.

I am certain that none of us sets out to keep people waiting, but delays can happen. Emergencies and unscheduled interruptions are part of a physician's day, and as the caregiver, we too become frustrated and upset when our schedules run overtime. However, there are some tips for keeping those delays to a minimum. But more about that next time.

The second letter I received recently brings to the attention of the Medical Society of New Jersey, the outstanding humanitarian act of Dr. Paul Reilly of Caldwell. When his patient had complications from cardiac surgery and had to return to Wisconsin, Dr. Reilly cancelled appointments and without recompense accompanied his patient to Wisconsin.

Dr. Reilly is commended by the Medical Society of New Jersey as an exemplary physician who bears witness to the dedication of members of the profession.

I am certain there are many such acts of selfless humanitarianism performed by physicians. I invite the members of the Society to send other examples, so we may give recognition to the nominated physicians. Isn't it time we honor those among us who serve our patients and the profession in an outstanding way?

*Correspondence may be addressed to Dr. Palma Formica, Medical Society of New Jersey, Two Princess Road, Lawrenceville, NJ 08648.

"The Power of the Pen"

When you decide to use Bactrim, use the power of the pen as well. Protect your prescribing decision in accordance with your state regulations to prevent substitution. It guarantees your patients will get the power of Bactrim.

NEW JERSEY MEDICINE

For urinary tract infection

Illustration of
Bactrim power
in urinary tract
infection.

Bactrim Power

- Penetrates
- Concentrates
- Overpowers
- Persists

Bactrim penetrates all tissues¹ to overpower most common susceptible uropathogens including *E. coli*, *Klebsiella* species, *Enterobacter* species, *Morganella morganii*, *Proteus* (*in vitro*) year after year.² B.i.d. dosing, easy transition from IV to oral, and economy help keep successful therapy within your power. Especially when you remember to protect your prescribing decision by specifying D.A.W.

Please note that *in vitro* data may not correlate with clinical experience. Bactrim is contraindicated in infants less than two months of age, in pregnancy at term, during lactation, and in documented megaloblastic anemia due to folate deficiency. Maintain adequate fluid intake.

Specify "Dispense as written"

Bactrim™ DS

(160 mg trimethoprim and 800 mg sulfamethoxazole/Roche)

Copyright © 1988 by Hoffmann-La Roche Inc. All rights reserved.

Please see references and summary of product information on following page.

Specify "Dispense as Written," "Do Not Substitute," or "Brand Necessary" according to your state regulations.

BactrimTM

(trimethoprim and sulfamethoxazole/Roche)

Before prescribing, please consult complete product information, a summary of which follows:
CONTRAINDICATIONS: Hypersensitivity to trimethoprim or sulfonamides, documented megaloblastic anemia due to folate deficiency, pregnancy at term and during the nursing period, infants less than two months of age.

WARNINGS: FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS.

BACTRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. Clinical signs, such as rash, sore throat, fever, arthralgia, cough, shortness of breath, pallor, purpura or jaundice, may be early indications of serious reactions. In rare instances a skin rash may be followed by more severe reactions, such as Stevens-Johnson syndrome, toxic epidermal necrolysis, hepatic necrosis or serious blood disorder. Perform complete blood counts frequently. **BACTRIM SHOULD NOT BE USED IN THE TREATMENT OF STREPTOCOCCAL PHARYNGITIS.** Clinical studies show that patients with group A β -hemolytic streptococcal tonsillopharyngitis have a greater incidence of bacteriologic failure when treated with Bactrim than with penicillin.

PRECAUTIONS: General: Give with caution to patients with impaired renal or hepatic function, possible folate deficiency (e.g., elderly, chronic alcoholics, patients on anticonvulsants, with malabsorption syndrome, or in malnutrition states) and severe allergies or bronchial asthma. In glucose-6-phosphate dehydrogenase deficient individuals, hemolysis may occur, frequently dose-related.

Use in the Elderly: May be increased risk of severe adverse reactions in elderly, particularly with complicating conditions, e.g., impaired kidney and/or liver function, concomitant use of other drugs. Severe skin reactions, generalized bone marrow suppression (see WARNINGS and ADVERSE REACTIONS) or a specific decrease in platelets (with or without purpura) are most frequently reported severe adverse reactions in elderly. In those concurrently receiving certain diuretics, primarily thiazides, increased incidence of thrombocytopenia with purpura reported. Make appropriate dosage adjustments for patients with impaired kidney function (see DOSAGE AND ADMINISTRATION).

Use in the Treatment of Pneumocystis Carinii Pneumonia in Patients with Acquired Immunodeficiency Syndrome (AIDS): AIDS patients may not tolerate or respond to Bactrim in same manner as non-AIDS patients. Incidence of side effects, particularly rash, fever, leukopenia, elevated aminotransferase (transaminase) values, with Bactrim in AIDS patients treated for *Pneumocystis carinii* pneumonia reported to be greatly increased compared with incidence normally associated with Bactrim in non-AIDS patients.

Information for Patients: Instruct patients to maintain adequate fluid intake to prevent crystalluria and stone formation.

Laboratory Tests: Perform complete blood counts frequently; if a significant reduction in the count of any formed blood element is noted, discontinue Bactrim. Perform urinalyses with careful microscopic examination and renal function tests during therapy, particularly for patients with impaired renal function.

Drug Interactions: In elderly patients concurrently receiving certain diuretics, primarily thiazides, an increased incidence of thrombocytopenia with purpura has been reported. Bactrim may prolong the prothrombin time in patients who are receiving the anticoagulant warfarin. Keep this in mind when Bactrim is used in patients already on anticoagulant therapy and reassess coagulation time. Bactrim may inhibit the hepatic metabolism of phenytoin. Given at a common clinical dosage, it increased the phenytoin half-life by 39% and decreased the phenytoin metabolic clearance rate by 27%. When giving these drugs concurrently, be alert for possible excessive phenytoin effect. Sulfonamides can displace methotrexate from plasma protein binding sites, thus increasing free methotrexate concentrations.

Drug/Laboratory Test Interactions: Bactrim, specifically the trimethoprim component, can interfere with a serum methotrexate assay as determined by the competitive binding protein technique (CBPA) when a bacterial dihydrofolate reductase is used as the binding protein. No interference occurs if methotrexate is measured by a radioimmunoassay (RIA). The presence of trimethoprim and sulfamethoxazole may also interfere with the Jaffe alkaline picrate reaction assay for creatinine, resulting in overestimations of about 10% in the range of normal values.

Carcinogenesis, Mutagenesis, Impairment of Fertility: **Carcinogenesis:** Long-term studies in animals to evaluate carcinogenic potential not conducted with Bactrim. **Mutagenesis:** Bacterial mutagenic studies not performed with sulfamethoxazole and trimethoprim in combination. Trimethoprim demonstrated to be nonmutagenic in the Ames assay. No chromosomal damage observed in human leukocytes *in vitro* with sulfamethoxazole and trimethoprim alone or in combination; concentrations used exceeded blood levels of these compounds following therapy with Bactrim. Observations of leukocytes obtained from patients treated with Bactrim revealed no chromosomal abnormalities. **Impairment of Fertility:** No adverse effects on fertility or general reproductive performance observed in rats given oral dosages as high as 70 mg/kg/day trimethoprim plus 350 mg/kg/day sulfamethoxazole.

Pregnancy: Teratogenic Effects: Pregnancy Category C. Trimethoprim and sulfamethoxazole may interfere with folate acid metabolism; use during pregnancy only if potential benefit justifies potential risk to fetus. **Nonteratogenic Effects:** See CONTRAINDICATIONS section.

Nursing Mothers: See CONTRAINDICATIONS section.

Pediatric Use: Not recommended for infants under two months (see INDICATIONS and CONTRAINDICATIONS sections).

ADVERSE REACTIONS: Most common are gastrointestinal disturbances (nausea, vomiting, anorexia) and allergic skin reactions (such as rash and urticaria). **FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS (SEE WARNINGS SECTION).**

Hematologic: Agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, neutropenia, hemolytic anemia, megaloblastic anemia, hypoprothrombinemia, eosinophilia, methemoglobinemia, allergic reactions: Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, allergic myocarditis, erythema multiforme, exfoliative dermatitis, angioedema, drug fever, chills, Henoch-Schoenlein purpura, serum sickness-like syndrome, generalized allergic reactions, generalized skin eruptions, photosensitivity, conjunctival and scleral injection, pruritus, urticaria and rash, Periarteritis nodosa and systemic lupus erythematosus have been reported. **Gastrointestinal:** Hepatitis (including cholestatic jaundice and hepatic necrosis), elevation of serum transaminase and bilirubin, pseudomembranous enterocolitis, pancreatitis, stomatitis, glossitis, nausea, emesis, abdominal pain, diarrhea, anorexia. **Genitourinary:** Renal failure, interstitial nephritis, BUN and serum creatinine elevation, toxic nephrosis with oliguria and anuria, crystalluria. **Neurologic:** Aseptic meningitis, convulsions, peripheral neuritis, ataxia, vertigo, tinnitus, headache. **Psychiatric:** Hallucinations, depression, apathy, nervousness. **Endocrine:** Sulfonamides bear certain chemical similarities to some goitrogens, diuretics (acetazolamide and the thiazides) and oral hypoglycemic agents; cross-sensitivity may exist. Diuresis and hypoglycemia have occurred rarely in patients receiving sulfonamides. **Respiratory:** Pulmonary infiltrates. **Musculoskeletal:** Arthralgia, myalgia. **Miscellaneous:** Weakness, fatigue, insomnia.

OSAGE AND ADMINISTRATION: Not recommended for use in infants less than two months of age. **URINARY TRACT INFECTIONS AND SHIGELLOSIS IN ADULTS AND CHILDREN, AND ACUTE DTITIS MEDIA IN CHILDREN:** Usual adult dosage for urinary tract infections is one DS tablet, two tablets or four teaspoonfuls (20 ml) b.i.d. for 10 to 14 days. Use identical daily dosage for 5 days for shigellosis. **Recommended dosage for children** with urinary tract infections or acute otitis media is 8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses every 12 hours for 10 days. Use identical daily dosage for 5 days for shigellosis. **Renal Impaired:** Creatinine clearance above 30 ml/min, give usual dosage; 15-30 ml/min, give one-half the usual regimen; below 15 ml/min, use not recommended.

ACUTE EXACERBATIONS OF CHRONIC BRONCHITIS IN ADULTS: Usual adult dosage is one DS tablet, two tablets or four teasp (20 ml) b.i.d. for 14 days.

PNEUMOCYSTIS CARINII PNEUMONIA: Recommended dosage is 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

HOW SUPPLIED: DS (double strength) Tablets (160 mg trimethoprim and 800 mg sulfamethoxazole)—bottles of 100, 250 and 500; Tel-E-Dose[®] packages of 100; Prescription Paks of 20. Tablets (80 mg trimethoprim and 400 mg sulfamethoxazole)—bottles of 100 and 500; Tel-E-Dose[®] packages of 100; Prescription Paks of 40. **Pediatric Suspension** (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 100 ml and 16 oz (1 pint). **Suspension** (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 16 oz (1 pint).

STORE TABLETS AT 15°-30°C (59°-86°F) IN A DRY PLACE PROTECTED FROM LIGHT. STORE SUSPENSIONS AT 15°-30°C (59°-86°F) PROTECTED FROM LIGHT.

Your medical practice
is a business, and if
that business does not
run efficiently, it will
affect your patient and
public relations.

MARY ANN HAMBURGER ASSOCIATES

would evaluate each element
of your office operations and
work with you...confidentially...
on an individual basis, to help
you achieve your aims as a
businessperson and as a
practicing physician.

Mary Ann can help by evaluating your:

- APPOINTMENT and/or SURGERY SCHEDULING • BILLING
- BOOKKEEPING • COLLECTIONS • CPT CODES and MACC PROFILES— ICD CODES • EQUIPMENT and SUPPLIES • FEE SCHEDULES • FILING SYSTEM • HIRING and TRAINING OF NEW and PRESENT PERSONNEL • INSURANCE (THIRD PARTY BILLING) • OFFICE LAYOUT and LOCATION • PATIENT FLOW
- RECALL SYSTEM • RECRUITMENT FOR HOSPITALS
- PURCHASING and SELLING OF MEDICAL PRACTICES
- TELEPHONE MANAGEMENT

Mary Ann can recommend specialists

for your business practice in these vital areas:

- ACCOUNTING • FINANCE • INSURANCE • LAW

**Mary Ann Hamburger offers you many services
ranging from a one-time survey to a continuing service
in which she will make regular visits to your office
to help with any pending problems.**

Catch 22, Revisited

HOWARD D. SLOBODIEN, M.D.

**Hospital Peer Reviewing;
Transactions; NEW JERSEY MEDICINE**

Most of you are aware of the continuing pressure on the medical profession to "clean up its act," to get rid of the impaired, incompetent, or dangerous physician. These terms are not interchangeable, but tend to be viewed that way by the media. Although there no longer is the same "conspiracy of silence" as in the past, certainly some physicians have been reluctant to blow the whistle on their colleagues. Of the several reasons for this reluctance, none has been more important than the threat of suit, sometimes with the additional threat of punitive damages, that can have a chilling effect on the best-intentioned efforts of those dedicated to maintaining the high quality of medical care.

And, now, the chill threatens to become a deep freeze. On May 16, 1988, the United States Supreme Court affirmed, 8-0, that physicians doing hospital peer review can be sued under antitrust laws and can be subject to large punitive awards, not covered by insurance. What are we to do? Can we be expected to police ourselves properly, as many of us have been doing, without new concerns about our own present and future welfare and that of our families?

The situation reminds me of the story of the relief pitcher being advised by the manager "not to walk him, but not to give him anything to hit." The pitcher says to himself, "I might as well eat the ball." And that is where we find ourselves: in the position of trying to swallow this unpalatable pill given us by the courts.

Stay tuned. Much has yet to be said on this subject; by the time you read this, we may well be at an entirely different level of understanding

This issue of *NEW JERSEY MEDICINE* contains the transactions of the House of Delegates in the 222nd year of the Medical Society of New Jersey. It records the accomplishments of the past year, some of the frustrations encountered, and a fair idea of the roads we must travel in order to keep faith with our patients as we continue to render quality medical care. Many thanks are due to Dr. Harry Carnes, immediate past-president, for an outstanding job. Our best wishes go to Dr. Palma Formica, our new president, on whose capable shoulders ride so many hopes for the coming year.

This also is the first issue in 15 years without the strong and steady hand of Dr. Arthur Krosnick at the helm. During his stewardship, *NEW JERSEY MEDICINE* developed a national reputation and received awards for excellence, including the recent first prize in the Sandoz competition. We all are indebted to Dr. Krosnick and wish him well in all his endeavors; we shall miss him.

We can help to repay our debt to him by ensuring the continuance of his standards. Our staff, the MSNJ staff, the Publications Committee, and the Editorial Board will maintain the level of their contributions. Can we count on you, Loyal Reader? We welcome your correspondence, especially manuscripts for publication. But, also, we look forward to your comments on all aspects of the journal, its format, and its content, so that we can hold, and perhaps exceed, our present high standards for *NEW JERSEY MEDICINE*.

Onward and upward. Excelsior!

AUTHOR INFORMATION

NEW JERSEY MEDICINE is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in NEW JERSEY MEDICINE is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

**“A big insurance company
that’s really listening to me?”**

**I don’t
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

We listened to you because we all share a common concern—the welfare of your patients.

After listening to your needs, we've developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey's medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate in the Blue Cross and Blue Shield network.

If you're not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Just call 1-800-842-BLUE for more information. Of course, there's no obligation.

The best insurance for a healthy practice.

ANNOUNCING A CURE FOR THE COMMON BEEPER.

SENSAR... A PAGER WITH STYLE!

Distinctively styled, **SENSAR** fits right into your practice...and your pocket!

With its lightweight, slim design, **SENSAR** can be carried in your pocket as comfortably and unobtrusively as your pen or pencil.

ELEGANCE . . . PLUS STATE-OF-THE-ART PERFORMANCE.

Alert tones are crisp and phone numbers are displayed with high visibility so you can respond to messages quickly and accurately.

SAVE MESSAGES FOR LATER.

SENSAR holds up to 5 messages in memory so you can return calls when it's best for you. Each message can include not only the phone number but important information such as extension, caller identification number or degree of urgency.

BE ALERTED DISCREETLY.

When sound could be disruptive such as during a consultation or a staff meeting, **SENSAR** can be set to beep just once with exclusive "Chirp Alert". Or, if you wish, you can even receive messages silently.

EVERYTHING YOU NEED TO KNOW . . . AT A GLANCE.

The 12 digit liquid crystal display tells you more than just your paging message. At a glance you can see whether your pager is on or off, if set to normal or discreet alert, if new messages are to be read and how many, and if the battery is starting to run low.

For a limited time, **SENSAR** is available with a subtle gold finish. Order now and receive a gold-tone CROSS PEN, which is yours to keep FREE OF CHARGE simply for trying the **SENSAR**. This offer is available exclusively from Radio Call Co. Just **\$32.50 per month**. (Lower prices in quantity).

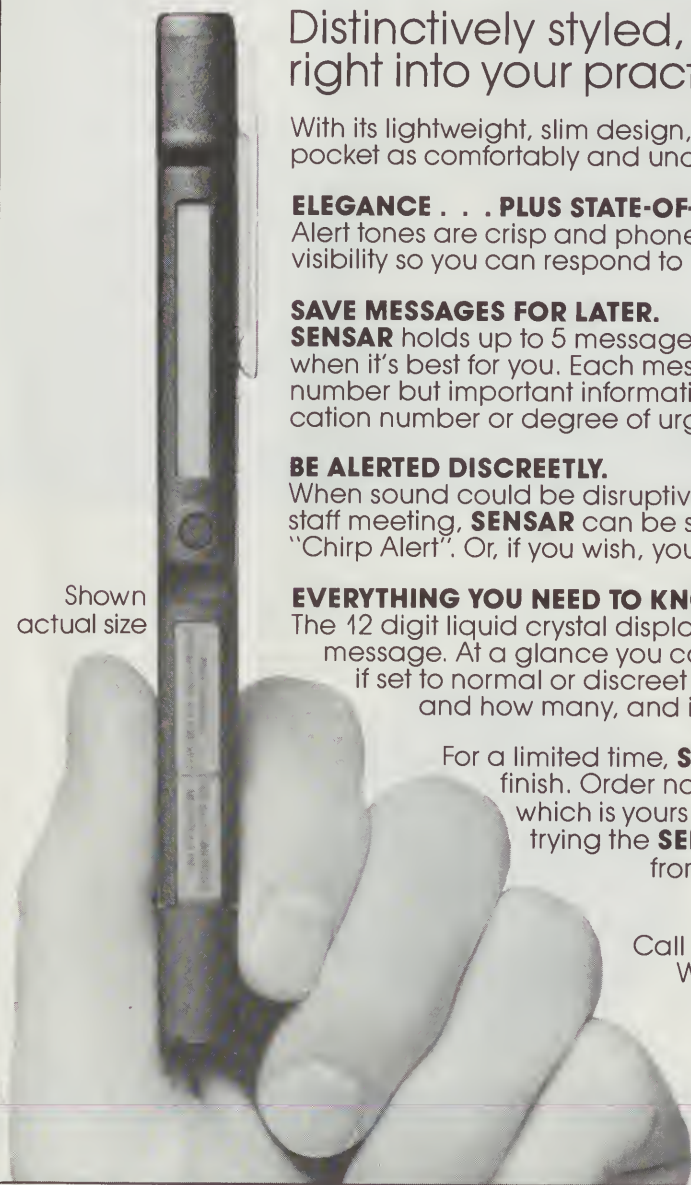

Call us at **201-487-BEEP** or **1-800-992-3949**. We'll arrange a free demonstration at your convenience.

CHANGING ECONOMIC ENVIRONMENT:

PHYSICIANS vs. PHARMACISTS

All of the health care professions have undergone rapid changes in the past several decades. The impact of consumer demand, third-party intervention, and increased competition among all the professionals has created conflicts between groups of health care providers.

The professional influence and control exerted by the physician has been challenged. Patients, their employers, and insurers have become knowledgeable consumers and demand superior care delivered in a cost-efficient manner for all Americans. Physicians have had to examine and modify their practice styles in an effort to compete in the medical marketplace.

Over the years, physicians slowly have changed their practices by introducing laboratory testing, diagnostic tests, electrocardiography, x-ray, and physical therapy. All of these modifications effectively have increased practice productivity, expanded patient options, and to a certain extent, have led to increased interprofes-

sional conflicts. With these changes, the missions of other health care providers, hospitals, and independent laboratories have been threatened. Recently, increasing numbers of physicians effectively have been dispensing drugs from their offices. This increase in consumer service has placed the physician in conflict with yet another professional—the pharmacist.

The current organization of the health care system is directly related to the history of the medical professions. The patterns of health care delivery, including the relationship between the physician and the pharmacist, have evolved through various stages. By the early 20th century, the codes of ethics regulating pharmacy and medicine already had drawn sharp distinctions between them. Diagnosis of disease and prescribing of medications were the prerogative of the phy-

JUDITH M. CONSIDINE, PH.D., AND STEPHEN J. GOULD, PH.D., NEW BRUNSWICK*

The increased competition among health care providers has been highlighted by the furor over drug dispensing by physicians. This study examines the changing economics of medical practice, the potential impact on the cost, and subsequent control of health care delivery.

sician, while the pharmacist slowly became the sole provider of the products and an overseer able to check for prescription errors. Physician dispensing disappeared in populated areas and was a tradition in isolated rural areas, even though physicians never have been prohibited from dispensing pharmaceuticals.

The conflict between physicians and pharmacists, regarding if, and under what circumstances, should physicians dispense drugs, has come under the scrutiny of legislative bodies on both the state and federal level. The House of Representatives Energy and Commerce Subcommittee on Health and Environment considered HR-2168, a bill restricting the practice of physicians selling prescription drugs at a profit.¹²

PHARMACIST PERSPECTIVE

The pharmacist views dispensing of drugs by the physician as an intrusion both economically and professionally. When a physician offers convenient dispensing of drugs in an office setting, the local pharmacy could lose sales. Many independent pharmacists are retail merchants who depend on customers coming into the pharmacy and looking through other non-prescription merchandise during the time that the prescription is being filled. Thus, the loss of revenue may come not only from a loss of prescription drug sales, but from a loss of the sale of other merchandise as well. In addition, most physicians will dispense only those drugs they most commonly prescribe and will continue to write prescriptions for those drugs used by fewer of their patients. Small pharmacies need to be concerned about the loss of sales with a high-profit margin and with the possibility of increased inventory obsolescence.

In arguing against physician dispensing, pharmacists cite numerous concerns including an ethical conflict of interest. In a free enterprise environment, the question arises whether the pharmacist will have an equal opportunity to compete fairly for the customer's business. They believe that the open competition between individual pharmacies will be converted to a closed market: doctor and patient.

Some health care economists feel that the patient will be intimidated by the physician and be unable to make a rational choice among competing alternatives. The traditional oversight function of pharmacy provided by the separation of the prescribing and dispensing functions will be lost.³ Another often-quoted argument is that the physician will prescribe and dispense drugs from a restricted inventory and select only those drugs which his office currently has in stock, failing to consider the patient's welfare above his own revenues.

PHYSICIAN PERSPECTIVE

Consumer choice and convenience are two underlying reasons for a physician choosing to dispense drugs. In the competitive marketplace, a patient may choose a physician who dispenses drugs and offers this option to the patients. Physician dispensing saves patients time and, possibly, money. The Federal Trade Commission has issued a statement in favor of physicians dispensing drugs because it offers an alternate choice for consumers.⁴ Numerous states are considering proposals regarding this drug dispensing issue and guidelines are being prepared by various state boards.⁵ As physician dispensing has become more widespread, drug repackaging firms have emerged. These firms have made drugs available, prepackaged in the dosage increments an individual physician prescribes. As these preparations already are labeled and sealed, the potential for an error involved in office repackaging is eliminated. Many of these entrepreneurial firms also have sophisticated computerized labeling, recordkeeping, and inventory systems, which greatly simplify office dispensing.

Patient compliance is said to be improved when the physician dispenses directly to the patient.⁶ The physician can provide immediate dialogue regarding the drugs' necessity, side effects which may be encountered, and the effects of noncompliance. Studies have shown that patients prefer advice concerning pharmaceuticals from the physician rather than from the pharmacist in an acute illness.⁷ An acutely ill patient can begin the medication immediately. For chronic, long-term conditions, in-office dispensing allows the physician an opportunity to monitor a patient's long-term compliance. Reports have stated that 20 percent of all hospital admissions for chronic conditions are related to patient noncompliance with outpatient drug therapy. The cost in both lost earnings and increased medical expenses is enormous for all concerned.⁸

If generic drugs are desired, physician dispensing can introduce consistency into these maintenance regimens. Both patients and pharmacies shop for the lowest cost generic drugs, thus introducing the possibility of a patient acquiring different generic products over a period of time. The variability of different generic substitutions of the same drug can cause deviations in the baseline for the therapeutic efficacy of a given pharmaceutical product. This is caused by differences in the bioavailability among various generic medicines. The consistent use of a single generic form of a drug, as dispensed in a physician's office, would eliminate this problem.

Other positive factors include confidentiality and lower cost for the patient. Drug repackaging firms suggest a dispensing fee of approximately \$3 to \$5 over the cost of the packaged prescription.⁹ The opportunity exists for the patient to obtain a prescription immediately, thus increasing compliance, and at a cost comparable to the local pharmacy. At the same time, an extra savings might accrue to the consumer. As physicians dispense drugs, they will gain knowledge about the costs of comparable drugs. The physician may prescribe an older, less costly drug rather than prescribing the more recent additions to the formulary in situations where either will suffice.

OVERVIEW

As the number of independent pharmacies decrease and the number of discount chains increase, the once strong physician-pharmacist link has weakened. The pharmaceutical industry has responded to the increased competition with physicians with an aggressive stance on policies of generic substitution, therapeutic substitution, and pharmacist prescribing. Generic substitution allows for the substitution of name drugs with inexpensive generic drugs at presumably lower prices. Most state laws prohibiting substitution now have been repealed. Therapeutic substitution, the actual substitution by the pharmacist of one prescribed drug in a given drug class by another in the same drug class, and pharmacist prescribing have met with a more vigorous response from organized medicine. However, one state, Florida, already has legislated that pharmacists may prescribe certain selected prescription drugs.⁹ Some pharmacists have been scheduling consultations with patients to review their medications and discuss drug interactions.

Physicians and their practice managers must determine whether dispensing drugs in their practice will enhance consumer welfare. Large practices may have an advantage in that they have the personnel to handle the inventory and added paper work. However, if greater numbers of physicians institute drug dispensing for patient convenience and compliance, all individual practitioners may have to consider this possibility to remain competitive.

FUTURE DEVELOPMENTS

The anticipated increase in physician dispensing of

medications in the office may force pharmacists to strive for a role greater than that of a prescription dispenser and retailer. An opportunity is presented to put their knowledge of drugs and drug interactions to good use as a patient consultant and advisor. They need to render a service as a health care professional who is concerned with patients' welfare.

Physician dispensing likely will increase patient compliance, offer increased service, and promote lower prices in the retail drug area. In addition, the physician can establish better doctor-patient communication, which is necessary for accurate diagnosis and treatment.

Economically, more pharmacists may be forced to accept the various drug insurance programs offered as part of the benefit package by large corporations. For corporate benefit managers, this trend must be observed closely in order to determine its overall effect on health care costs.

The continuing evolution of the interrelationships of professions and changing consumer attitudes have a great influence on health care delivery. Simultaneously, political and social pressures have mandated change. Along with the many recent changes in health care delivery, physician dispensing currently is one of the most controversial. The benefits derived by the consumer will determine the outcome of this conflict. The most important consideration is quality care.

A NEW H₂ Antagonist

AXID[®] 300mg

nizatidine

Effective once-nightly
duodenal ulcer therapy available in a
Unique Convenience Pak
for better patient compliance

AXID[®] nizatidine capsules

Brief Summary. Consult the package insert for prescribing information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients, at a reduced dosage of 150 mg b.i.d., after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H₂-receptor antagonists.

Precautions: General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests: False-positive tests for urobilinogen with Multistix[®] may occur during therapy with nizatidine.

Drug Interactions:—No interactions have been observed between Axid and theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility:—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose related increase in the density of enterochromatin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high dose males compared to placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement

compared to concurrent controls, and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive, and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery is not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, and the mouse lymphoma assay.

In a two-generation, perinatal and postnatal, fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C:—Oral reproduction studies in rats at doses up to 300 times the human dose, and in Dutch Belted rabbits at doses up to 55 times the human dose, revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers:—Nizatidine is secreted and concentrated in the milk of lactating rats. Pups reared by treated lactating rats had depressed growth rates. Although no studies have been conducted in lactating women, nizatidine is assumed to be secreted in human milk, and caution should be exercised when nizatidine is administered to nursing mothers.

Pediatric Use:—Safety and effectiveness in children have not been established. **Use in Elderly Patients:**—Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Domestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among the more common adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events was also reported; it was not possible to

determine whether these were caused by nizatidine.

Hepatic:—Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT [AST], SGPT [ALT], or alkaline phosphatase), occurred in some patients possibly or probably related to nizatidine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L), and in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three times the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular:—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

Endocrine:—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hematologic:—Fatal thrombocytopenia was reported in a patient who was treated with Axid and another H₂-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs.

Integumentary:—Sweating and urticaria were reported significantly more frequently in nizatidine than in placebo patients. Rash and exfoliative dermatitis were also reported.

Other:—Hyperuricemia unassociated with gout or nephrolithiasis was reported.

Overdosage: There is little clinical experience with overdosage of Axid in humans. If overdosage occurs, use of activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous LD₅₀ values in the rat and mouse were 301 mg/kg and 232 mg/kg respectively.

MEASLES EPIDEMIC IN NEW JERSEY: 1985-1986

JOHN PORTER, M.D., M.P.H., TRENTON*

Between November 15, 1985, and June 30, 1986, 905 cases of measles were reported in northern New Jersey, principally among preschool children. This outbreak could have been prevented by the early recognition and reporting of measles cases and in ensuring age-appropriate vaccination of all children.

Measles outbreaks from 1980-1985 have occurred predominantly in school and college-age children.^{1,2} In 1985-1986, an outbreak in New Jersey occurred which differed from these recent patterns in that it affected primarily preschoolers. This report describes the epidemiologic characteristics of this measles outbreak, the assessment of immunization levels in affected communities, and aspects of epidemic control.

BACKGROUND

After five years of reports of less than ten cases of measles annually, New Jersey experienced a large outbreak in 1985-1986 with 905 cases. The majority of the cases were reported from Jersey City, a socioeconomically depressed community of 560,000 in the northeastern part of the state. A second focus of disease occurred in Paterson in bordering Passaic County, with a population of 450,000. Both counties have substantial Hispanic communities: 104,000 Hispanics in Hudson County and 42,000 Hispanics in Passaic County.

New Jersey law requires all children attending public or private school (including child-care centers, nursery schools, and kindergartens) to be appropriately vaccinated against measles on or after the first birthday.⁶ Religious exemptions are permitted under state law.

METHODS

Definition. A measles case was defined as a person with generalized maculopapular rash of more than three days' duration; fever (101° F, if measured); and at least one of the following: cough, coryza, or conjunctivitis.⁴ A person was considered to have adequate evidence of immunity if immunized with measles vaccine at more than 12 months of age, or if there was a history of physician-diagnosed measles. A case was considered preventable if a person was more than 16 months of age, was born after 1956, lacked evidence of immunity to measles (as defined), had no medical contraindication to receiving measles vaccine, and had no religious exemptions under state law.

Surveillance. The New Jersey State Department of Health collects information on all suspected measles cases. By law, any suspected case must be immediately reported to the Department; the case is investigated by a staff member, and a surveillance form is completed.⁵ The data collected include: name, age, address, sex, symptoms, vaccination status, and transmission set-

Figure 1—Measles cases by week of onset in 1986.

ting, as well as information on possible contacts. No information on race is routinely requested; however, during this outbreak, surnames were used as a means of differentiating Hispanic from non-Hispanic cases.

Rates of disease were calculated using population data from the 1980 New Jersey census. In addition, some adjusted census information was available for the years 1981 to 1983. Because the age categorization of the population census was different from that needed for the calculation of relevant age-specific measles incidence rates, age population estimates were made from the available data.

Paired serum samples were obtained from 165 of the case-patients and were stored at -20°C . Cases with a fourfold or greater rise in titer of hemagglutination-inhibiting (HI) and/or complement-fixing (CF) antibody to measles, were considered to be seroconfirmed.

Immunization levels in the areas affected by the outbreak were assessed using two surveys. In the first study, all immunization records in child-care centers and schools in the areas where measles cases were occurring, were audited for age-appropriate vacci-

nations and studied. The second study was of new school entrants for the 1985 to 1986 school year. (This survey was conducted in a sample of schools that had been selected randomly from all schools in urban and suburban municipalities. These same schools had been chosen for the last survey after the previous epidemic in 1980.)

The purpose of the study was to determine at what ages children were vaccinated against measles in order to determine if there had been an improvement in age-appropriate vaccination between 1981 and 1986. Urban schools were those within city limits. Suburban schools were situated outside city limits and were in municipalities surrounding areas affected by the measles outbreak.

RESULTS

Descriptive Epidemiology. Between November 15, 1985, and June 30, 1986, 905 clinically confirmed cases of measles were identified (Figure 1). A total of 9.7 percent (88/905) of the measles cases were serologically confirmed. The index case was a 30-month-

old Hispanic child, a resident of Jersey City, who developed a maculopapular rash on November 15, 1985. He had received measles/mumps/rubella (MMR) vaccination at the age of 15 months. The source of his infection was unknown.

The site of the outbreak was the northeastern part of New Jersey. The early cases and, ultimately, the majority of cases (489/905, 54 percent) were reported from Jersey City. However, on March 25, 1986, there was evidence of a sustained outbreak occurring in the neighbouring city of Paterson (Figure 1).

Overall, 59 percent of reported cases (531/905) were in preschool children less than five years of age. Among these, 163 (18 percent) cases were more than 12 months, 96 (11 percent) cases were 12 to 15 months, and 272 (30 percent) cases were in the 16-month to four-year age group. Early in the outbreak, very young children were involved; 16 of the first 23 cases reported (70 percent) involved children less than 15 months of age. The age-specific attack rate was high for children less than 12 months of age (11.0/1,000), with a rate of 7.0/1,000 in children from 16 months to four years of age. Age-specific attack rates decreased with increasing age (Table 1).

Of the 905 cases, 31 percent (279/905) of the cases were defined as preventable (Table 2). Among the 263 preschoolers more than 15 months of age, 237 (90 percent) cases were preventable, 234 cases were unvaccinated, and 3 cases had been vaccinated at less than 12 months of age. Of the 575 nonpreventable cases, 45 percent (259/575) were less than 15 months of age, 51 percent (296/575) had a history of vaccination, and 4 percent (20/575) either were born before 1956 or had a medical or religious exemption. Ten percent (26/263) of cases among preschoolers (16 months to four years) were not preventable compared with 90 percent (250/279) of cases among school-age children.

Thirty-one percent (276/905) of the total outbreak occurred in people with Hispanic surnames. The race-specific data for Jersey City showed an attack rate of 4.0/1,000 for the Hispanic community (total Hispanic population = 36,000) compared with an attack rate of 0.8/1,000 for non-Hispanics.

There were no measles deaths during this epidemic. However, a total of 16.5 percent (149/905) of cases had a measles complication; including 60 cases of pneumonia, 35 cases of otitis media, and 1 case of encephalitis. Twenty-four percent (36/149) of complications occurred in children less than 12 months of age, 14.8 percent (22/149) in 12 to 15 month olds, and 35 percent (52/149) in the 16-month to four-year age group. Fourteen percent (126/905) of all persons with measles were hospitalized.

Assessment of Immunization Levels. In Jersey City, all the schools were audited for their measles immunization status and a measles coverage of more than 98 percent was found. Fifty-four child-care centers in the city, with a total enrollment of 1,558 children, were similarly investigated and a total of 160 of these children (10 percent) had not received measles vaccination.

In Paterson, 24 child-care centers with a total of 1,620 children were audited. Ten percent of these children were not immunized against measles and in one center, only 31 percent (14/45) of the pupils had re-

ceived appropriate measles vaccination.

The results of the school entrants' survey showed that suburban municipalities had better immunization rates for measles than urban municipalities (Table 3). Compared to the retrospective survey in 1981, vaccination levels had improved slightly in urban areas. In Jersey City, measles vaccination levels increased from 56 percent at 24 months of age in the 1981 survey, to 60.2 percent in the 1986 survey with measles vaccination levels in suburban areas remaining essentially unchanged.

Control Measures. Control measures were directed at the vaccination of preschoolers, the prevention of transmission in schools, and the prevention of transmission in medical-care settings. To address the first control measure, additional vaccination clinics were established in schools, clinics for women, infants, and children (WIC), and emergency rooms of local hospitals. Also, a mobile vaccination unit travelled around the city administering the vaccine to children in the housing projects. Information about the vaccination clinics and the progress of the epidemic were prepared for both the Spanish and English news media.

Because of the large percentage of measles cases occurring in children less than 15 months of age (33 percent of the total cases as of February 23), the age for vaccination was lowered to 12 months, initially in Jersey City alone, but later in affected surrounding counties. In April, the vaccination age in Jersey City was lowered further to 6 months because more than 15 percent of cases were occurring in children less than 12 months of age.

Vaccine administration was most successful in the WIC clinics and in certain emergency rooms. There was, however, a poor response to the special clinics (mean of 11 vaccinations/clinic) and to the mobile vaccination unit (177 vaccinations in three weeks) in these areas.

To prevent measles transmission in schools and child-care centers, unvaccinated children were excluded from the institution until they had received a measles vaccination. In order to prevent measles transmission in medical-care settings, specific recommendations were made: there be triage and isolation of measles cases in outpatient clinics, emergency rooms, and pediatric departments; persons with suspected measles cases were to be scheduled for appointment when few or no other patients were expected to be present; hospitalized patients with measles were to be nursed in strict respiratory isolation throughout their infectious period; and all staff should be appropriately vaccinated against the disease.

DISCUSSION

This measles outbreak is different from most of the recent U.S. outbreaks,¹⁻³ but is similar to the pattern seen in the pre-vaccine era. The majority of cases occurred among preschool age children in an urban municipality which was found to have low levels of measles immunization among its preschoolers. There is only one recent report of a similar outbreak and that occurred in Chicago in 1983.⁷ Following the New Jersey outbreak of 1986, there have been similar reports of preschool epidemics in New York City and in Miami.⁸

Figure 2—Measles cases from 1969 to 1986.

The New Jersey outbreak was started in preschoolers and remained predominantly among this age group. One reason for preschool transmission was that in Jersey City and Paterson, only 60 percent of children entering school in 1985 had received their measles vaccination before their second birthday. We can assume, therefore, there was a large pool of children susceptible to measles, who subsequently became infected following the introduction of the virus into the community in November 1985.

As the control measure data demonstrates, it was difficult to improve the vaccination levels among preschoolers. But, why are preschool children not being vaccinated? Many reasons have been suggested: the perception of measles as a mild disease, the lack of education of parents in disease prevention, and the general apathy of the population to childhood infectious diseases. Unfortunately, we were unable to obtain information on these subjects, but studies are needed to determine the specific reasons why children fail to receive appropriate measles vaccination. With this additional information, resources can be directed at the education of appropriate parent groups. Our data in-

dicated that the outbreak was sustained in an urban area with the highest attack rate for disease occurring among the Hispanic community. Future measles outbreaks need to determine if being Hispanic and living in an urban area makes it less likely for a child to be appropriately vaccinated against the disease.

Measles epidemics in New Jersey have occurred at approximately five-year intervals since 1969 (Figure 2). Despite the increased vaccination levels among school-age children during the past five years,⁹ large numbers of susceptible preschoolers were able to sustain transmission in this outbreak. Unless preschool-age vaccination can be increased to a level of more than 90 percent,¹⁰ there always will be a risk of further periodic epidemics occurring in the state. Pediatricians and other health-care workers must ensure that all children in their practices have been appropriately vaccinated.

There are reports from both New York and Florida that recent measles outbreaks in these states also have been occurring in preschool-age children.⁸ This information indicates that in order to prevent further measles outbreaks, all states need to investigate the immunization coverage of their preschoolers and to establish innovative campaigns to encourage and ensure age-appropriate vaccination of their preschool children.

DOCTORS' BILL

The "collateral source" bill passed by the New Jersey Legislature and signed into law by Governor Kean is a significant victory in the Exchange's efforts to reform the medical malpractice legal system. The Exchange provided the leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. Elimination of some costly inequities in our tort system will help moderate the ever-increasing severity of insurance losses.

CASE REPORT: CONJOINT THERAPY WITH A DEAF AND MUTE COUPLE BY A HEARING THERAPIST

RAKESH K. BANSIL, M.D., AND CARMELO A. COLÓN, M.S.S.W., NEWARK*

We describe a case of successful conjoint therapy with a deaf and mute couple, including discussions of the psychiatric aspects of deafness in general and the specific influence of an interpreter in therapy with the deaf.

By definition, psychotherapy is an art and science that employs verbal and nonverbal modes of communication as the primary tools for treatment. Inability to communicate freely due to hearing impairment, thus, poses a major challenge. Few adequate descriptions of psychotherapy for the deaf are to be found in the literature and there is a paucity of mental health personnel to treat this population. However, successful cases of family therapy,¹ group therapy,² behavior therapy,³ psychodrama,⁴ and psychoanalysis⁵ of the deaf and mute have been described in the literature. To the best of our knowledge, this is the first case report of conjoint therapy with a deaf and mute couple.

CASE REPORT

Mr. C. is a 31-year-old male and has been deaf since the age of 2. He was abandoned by his mother at an early age and was raised by his grandmother. He remained in an institution for the mentally retarded from age 5 to 12 and received little formal education because he was considered mentally retarded. Subsequently, he broke all bonds with his family and on his own learned to lip read and communicate in sign language.

Mrs. C. is a 32-year-old female who has been deaf since birth. She was raised by an alcoholic and physi-

cally abusive mother and a passive and emotionally uninvolved father. She attended a special school for the deaf and learned lip reading and sign language. She also suffers from severe scoliosis of the spine and has had several corrective surgical operations. Periodically, she goes through bouts of depression and claims that, at such times, alcohol has been the source of relief for her.

Mr. and Mrs. C. have been married for the past eight years and were referred for outpatient psychiatric treatment in September 1984 by the New Jersey Division of Youth and Family Services (DYFS), because of alleged incidents of sexual abuse of their five-year-old daughter by Mr. C. At the time of our initial contact, Mr. C. was separated from his wife at the suggestion of DYFS and their daughter was placed in temporary physical custody of her maternal grandmother.

The couple has been seen for 51 sessions of conjoint therapy. The majority of our sessions were assisted through the services of a sign interpreter. When the interpreter was absent, communication was limited to the written mode.

*Dr. Bansil is assistant professor of clinical psychiatry and Mr. Colón is a mental health clinician at UMDNJ-Community Mental Health Center, Newark. Correspondence may be addressed to Dr. Bansil, Community Mental Health Center, Room C-441, 215 South Orange Avenue, Newark, NJ 07103.

As therapy progressed, Mr. C. began to acknowledge his outbursts of anger and was able to sit with his wife and participate in mature dialogue. Mrs. C. began to acknowledge that Mr. C. was a source of support for her and she significantly reduced her drinking.

Normal physical examination of the child in question and lack of evidence of sexual abuse on further investigations led the court to drop all charges against Mr. C.

By September 1985, their problems were sufficiently resolved to the point they decided to end their formal separation. In subsequent sessions, Mr. and Mrs. C. continued to show gradual progress. With our support, in April 1986, the broken family was reunited and continues to live relatively happily.

DISCUSSION

This case allows us to review certain issues regarding the psychiatric aspects of deafness, in general, and the influence of an interpreter in therapy with the deaf, specifically. The findings in the literature are evident in this case: deaf patients often come to treatment not through self-referral, but rather because someone referred them;⁶ they tend to be regarded as mentally retarded;⁷ and they tend to be rejected by their family.¹

The majority of our sessions were conducted through an interpreter. The influence of an interpreter in therapy with the deaf has been discussed.⁸⁻¹¹ Clearly, an interpreter makes listening and understanding less tiring for both the patient and the therapist. Nonetheless, there are problems inherent in using an interpreter that can noticeably alter or hinder therapy. Most of these problems revolve around the triangular nature of interaction with the interpreter at the apex. This arrangement often results in a loss of visual and emotional contact between the therapist and the patient, it dilutes the transference, and may lead to the loss of therapist credibility. Many of the signs of mental illness, e.g. the thought disorder in schizophrenia, the retardation of thought in depression, the pressure of speech in mania, are all appreciated through normal spoken language and any degree of communication difficulty will interfere with their appreciation. A good interpreter, of course, should try to convey affective nuance and emphasis by voice when speaking what the patient has communicated in signs. It also is necessary that the interpreters maintain strict neutrality; disapproval of the way therapy is being con-

ducted can clearly undermine the therapist's efforts to effect any change. The therapist needs to be aware that negative countertransference feelings are likely to develop because of the exhaustive nature of the sessions, feelings of powerlessness, and lack of connectedness with the patient. Perhaps a major factor contributing to the successful therapy in this case was the support Mr. and Mrs. C. provided for each other. Nonetheless, we feel that despite these difficulties, deaf patients can be successfully treated by hearing therapists through the utilization of an interpreter and, furthermore, it can be an extremely rewarding experience.

CONCLUSION

Ideally, deaf and mute persons who have emotional difficulties should be treated by mental health professionals who can communicate through sign language. However, because of the paucity of therapists who are trained in sign language, it is more likely that an interpreter will be used to conduct therapy with this population. An understanding of the psychiatric aspects of deafness and, specifically, the influence of an interpreter in therapy are essential for the treatment to be effective.

CASE REPORT: ANTERIOR DIAPHRAGMATIC HERNIA (HERNIA OF MORGAGNI)

CHARLES VALASES, M.D., AND CHARLES SILLS, M.D., LONG BRANCH*

The anterior diaphragmatic hernia (hernia of Morgagni) occurs as a result of congenital weakness of the parasternal portions of the diaphragm. Most are asymptomatic, and often are detected incidentally on chest x-ray. Once it is diagnosed, surgical repair is mandatory.

The embryogenesis of the diaphragm is a complex process occurring between weeks 8 and 10 of development. A number of congenital diaphragmatic defects may occur, and have been classified: 1) partial or complete absence of the diaphragm; 2) posterolateral defects of the pleuroperitoneal membrane (foremen of Bochdalek); 3) parasternal defects (foramen of Morgagni); 4) eventration of the diaphragm; 5) defects of the septum transversum; and 6) defects of the esophageal hiatus.¹

Of the congenital herniations through the diaphragm, the posterolateral hernia (of Bochdalek) is the most frequent. It manifests as acute respiratory distress in the newborn.² The hernia of the foramen of Morgagni is much less common, and usually is asymptomatic during childhood.

We present a case of a Morgagni hernia in a teenage male which became symptomatic shortly after he began to engage in the strenuous sport of weightlifting. A discussion of the pathogenesis, symptomatology, diagnosis, and surgical management of Morgagni hernias also is included.

CASE REPORT

A 14-year-old white male on a routine sports physical examination was found to have an asymptomatic resting tachycardia of 120 beats per minute. He com-

plained of "pounding" in his head while running, as well as vague discomfort of the lower thoracic spine region. At the age of 10 years, he had been diagnosed as having asthma, and was placed on an oral theophylline preparation. For the past 2 years, he regularly engaged in the sport of weightlifting.

A chest x-ray (Figure 1) demonstrated a large homogeneous soft tissue mass of the right pericardio-phrenic region, located in the anterior mediastinum (on the lateral film). A roentgenogram of the chest performed three years prior to this x-ray was reported as normal. The computed tomography (CT) scan of the chest (Figure 2) demonstrated a large mass of the anterior mediastinum abutting the right cardiac border. It had the density of fat. Preoperatively, it was felt that this represented a mediastinal lipoma possibly related to the pericardium.

Through a median sternotomy incision, the mass was found to be omentum (10 to 12 cm in diameter), which had herniated into the mediastinum (Figure 3). It arose through a 5 cm diaphragmatic defect of the right foramen of Morgagni (Figure 4). The hernia sac and contents were reduced through the diaphragmatic

*Dr. Valases is a surgical resident and Dr. Sills is chief of thoracic surgery, Monmouth Medical Center. Correspondence may be addressed to Dr. Valases, Department of Surgery, Monmouth Medical Center, Long Branch, NJ 07740.

Figure 1—Chest x-ray demonstrating a homogeneous soft tissue mass of the right pericardiophrenic region.

Figure 2—CT scan of the chest demonstrating an anterior mediastinal mass abutting the right cardiac border.

defect which then was primarily reapproximated with interrupted Surgilon[®] sutures. The margins of the defect were attenuated, almost membranous; therefore, the suture line was reinforced with a Gortex[®] patch sutured over the repair with prolene sutures.

The patient's postoperative course was unremarkable except for a superficial wound infection. At the time of hospital discharge, his tachycardia had resolved, his chest x-ray demonstrated a normal cardiac shadow, and he no longer required bronchodilators.

DISCUSSION

The anterior diaphragmatic hernia (hernia of Morgagni) originally was described in the latter part of the 18th century by Giovanni Morgagni. The herniation occurs through the foramen of Morgagni (or spaces of Larey, or parasternal spaces). These foramina are bounded medially by diaphragmatic muscle from

the xiphoid process, and laterally by diaphragmatic muscle from the costal cartilages.¹ It is through these spaces that the superior epigastric vessels penetrate the diaphragm.

Embryologically, the central tendinous portion of the diaphragm develops from the septum transversum, and attaches to the costal cartilages and to the sternum.² The muscular portion of the diaphragm has its origin from the xiphoid process, the lower ribs, and the posterior costal cartilages. It inserts on to the central tendon of the diaphragm.³ If there should be a partial or incomplete fusion of the muscle fibers originating from the xiphoid process and from the ribs, an area of congenital weakness then exists in the parasternal portion of the diaphragm. Due to the lack of adequate muscularization, this area then becomes membranous.⁴ These weakened areas are triangular spaces on either side of the xiphoid process.

Morgagni hernias are relatively rare, accounting for 3 percent of diaphragmatic hernias.⁵ At the Texas Children's Hospital, over a 25-year period, only five infants were treated for a Morgagni hernia.⁶

For the most part, Morgagni hernias are asymptomatic. It either is detected incidentally on chest x-rays, or it becomes symptomatic in adulthood. The symptoms usually are restricted to vague epigastric discomfort. Situations which result in increased intra-abdominal pressure,⁷ such as obesity, trauma,⁸ and, in our case, weightlifting, are precipitating factors.

The herniation may occur on either side of the xiphoid, but 90 percent occur on the right side.⁸ Omentum and preperitoneal fat are the most common contents of the hernia,⁵ although bowel or stomach also may herniate. There have been reports of gastric volvulus occurring within a Morgagni hernia.⁹

The herniation most commonly is detected on chest x-ray as a smooth, supradiaphragmatic shadow at the right pericardiophrenic angle. If it contains only fatty tissue, i.e. omentum, it presents as a homogeneous mass which must be differentiated from other mediastinal masses, e.g. neoplasms, lipomas, and from cardiomegaly.⁵

If the contents of the hernia also include bowel, gas usually can be detected within the hernia on the roentgenograms. This finding makes the diagnosis more readily apparent, and confirmed more easily by upper or lower gastrointestinal contrast studies.

Once the diagnosis has been established, most authorities agree that surgical repair is mandatory, even in the asymptomatic patient.^{4,10} The surgical approach may be transabdominally or transthoracically, or via a combined upper laparotomy and lower median sternotomy.¹¹ If the defect is small, it may be repaired primarily. If it is large, or the diaphragmatic margins are attenuated, a Gortex[®] patch may be used to reinforce the suture line. The patch also may be used to bridge the defect as is done with large posterolateral (Bochdalek) hernias.¹²

SUMMARY

Morgagni hernias are relatively rare diaphragmatic defects. The diagnostic evaluation, in addition to the routine chest roentgenogram, also includes CT scanning, and upper and lower gastrointestinal contrast studies. The diaphragmatic defect may be repaired

Figure 3—A large right anterior diaphragmatic hernia. The hernia sac and its contents (omentum) are being held as they protrude through the diaphragmatic defect into the right hemithorax.

Figure 4—The anterior diaphragmatic defect at the right foramen of Morgagni. The hernia sac and contents have been reduced through the defect back into their normal infra-diaphragmatic location. The margins of the defect are being held by the sutures.

either transthoracically or transabdominally, resulting in a surgical cure.

HIGHLIGHTS FROM THE 222ND ANNUAL MEETING

The Medical Society of New Jersey's 222nd Annual Meeting was held at the Sheraton Meadowlands Hotel in East Rutherford from April 28, 1988, to May 1, 1988.

Reverend Doctor Louis G. McAfoos, Jr., from the Grace Episcopal Church in Haddonfield delivered the invocation. Lindsay L. Pratt, M.D., Chairman of the Committee on Credentials presented his report to the House of Delegates. Following was the announcement of appointments: George T. Hare, M.D., Chief Teller; Michael J. Gentlesk, M.D., Chief Sergeant-at-Arms; and Janet I. Geraghty-Deutsch, M.D., Timothy M. Hosea, M.D., and Charles Zwerling, M.D., Sergeants-at-Arms.

The 1988-1989 MSNJ Board of Trustees: (seated left to right): Bernard Robins, M.D.; Paul J. Hirsch, M.D.; Palma E. Formica, M.D.; Douglas M. Costabile, M.D.; Joseph N. Micale, M.D.; Harry M. Carnes, M.D.; (standing left to right) Joseph P. Zawadsky, M.D.; George L. Triebenbacher, M.D.; Carl Restivo, Jr., M.D.; Herman M. Robinson, M.D.; R. Gregory Sachs, M.D.; Michael M. Heeg, M.D.; Louis L. Keeler, M.D.; Frank Gingerelli, M.D.; Fred M. Palace, M.D.; Edwin W. Messey, M.D.; Joel S. Cherashore, M.D.; Scott Lauer; Shah M. Chaudhry, M.D.; and John J. Pastore, M.D. Absent: Joseph A. Riggs, M.D., and Gerald H. Rozan, M.D.

Speaker of the House Henry J. Mineur, M.D., begins the 222nd Annual Meeting of the Medical Society of New Jersey.

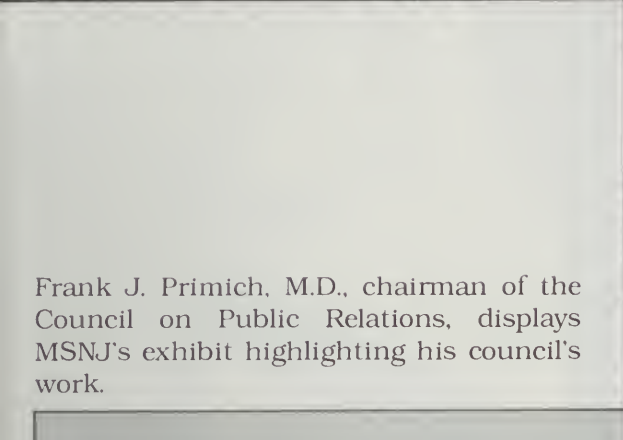

President Palma E. Formica, M.D., is congratulated by Harry M. Carnes, M.D.

William E. Ryan, M.D., chairman of the Board of Directors of JEMPAC, presents an award to Kathy Gavett of AMPAC.

Members of our Bergen County component and executive director George Willis (top, left) accept their honors at the 32nd Annual Golden Merit Awards.

Frank J. Primich, M.D., chairman of the Council on Public Relations, displays MSNJ's exhibit highlighting his council's work.

Angio Campo, president of the Auxiliary (second from right, seated), meets with Auxiliary fellowettes.

Newly elected county presidents and MSNJ Auxiliary president Angio Campo discuss projects at a working breakfast meeting.

Palma E. Formica, M.D., and family at her inaugural reception at the Sheraton Meadowlands Hotel.

James S. Todd, M.D., MSNJ honorary fellow, greets Dr. Formica, president-elect Paul J. Hirsch, M.D., and past-president Dr. Carnes.

MSNJ executive director Vincent Maressa and his wife Arlene celebrate at the dinner-dance held in Dr. Formica's honor.

Trustees' Minutes April 27, 1988

A regular meeting of the Board of Trustees was held on Wednesday, April 27, 1988, at the Sheraton Meadowlands Hotel, East Rutherford. Detailed minutes are on file with the secretary of your county society. A summary of significant actions follows:

Check Presentation . . . Noted that Mrs. Richard Lorber, chairman of the MSNJ Auxiliary American Medical Association Education and Research Foundation Committee, presented four checks totalling \$34,460.68 to Dr. Bergen, president of UMDNJ.

Report of the President . . .
MSNJ Special Assessment . . . Heard that payment of the special \$100 assessment was mandated before any delegate was seated in the 1988 House of Delegates.

Report of Executive Director . . .
(1) MSNJ Paid Membership . . . Noted that paid memberships through March 1988 total 6,669.
(2) Financial Statements . . . Reviewed and approved the financial

statements for the period ending March 31, 1988.

(3) Preadmission Certification/Utilization Review . . . Directed that an appropriate letter be sent to the commissioner of insurance objecting to the proposed regulations, and setting forth MSNJ's position that review on all patients hospitalized in New Jersey must be conducted by certified utilization review organizations through the Department of Health.

(4) Medicaid Fees/Garden State Health Plan . . . Heard that Mr. Maressa reaffirmed the Society's position recognizing the Garden State Health Plan as a new, innovative, and potentially viable method of delivering quality health care to Medicaid recipients; and that MSNJ appreciates the decision to implement the plan on a voluntary basis for patients and physicians.

UMDNJ Report . . . Noted Dr. Bergen's report highlighting the following: the Senate passed S-1014 which provides participants in accredited graduate education programs a temporary license not to exceed a six-year period; and activity has been observed at all levels toward having a single examination for all applicants for entry into graduate medical education, and a single examination for licensure.

Council on Legislation . . . Approved all the positions recommended by the Council on Legislation with the exception of the following: (1) S-1963-Rice—HIV Antibody Testing: position changed to conditional approval; (2) A-267-Felice—Pharmacy: position changed to action deferred; (3) A-271-Felice—Osteoporosis: position changed to disapproved; and (4) A-472-Colburn—Certificate of Need: position changed to action deferred.

Report by MSNJ Lobbyist . . . Noted Clark Martin's meeting with William B. Brown (D), new minority leader of the New Jersey State Assembly, for a discussion on the bill for mandatory assignment of Medicare fees.

New Business . . .

(1) PRO Contract . . . Voted to postpone consideration of Dr. David I. Kingsley's request for support from MSNJ to accompany PRO's current bid for the New Jersey peer review contract.

Trustees' Minutes May 1, 1988

A reorganization meeting of the Board of Trustees was held on Sunday, May 1, 1988, at the Sheraton Meadowlands Hotel, East Rutherford. Detailed minutes are on file with the secretary of your county society. A summary of significant actions follows:

Reorganization . . . Officially welcomed Shah M. Chaudhry, M.D., the newly elected trustee from the fifth district; Scott Lauer, the newly designated student member; Paul J. Hirsch, M.D., president-elect; Douglas M. Costabile, M.D., first vice-president; Joseph A. Riggs, M.D., second vice-president; and Mrs. Frank Campo, newly elected president of the MSNJ Auxiliary. Also, voted to continue holding regular Board meetings on the third Sunday of each month at 10 A.M. at MSNJ headquarters.

Referrals from 1988 House of Delegates . . . Noted that complete information appears in the Transactions section of this issue.

(1) Substitute Resolution #20—Addressing the Shortage of Nursing and Technical Personnel . . . Authorized the president to appoint a task force to address the shortage of nurses and technical personnel problem.

(2) Resolution #22E—Senior Medical Courtesy Programs . . . Directed that the president or her designee send appropriate letters to the county medical societies, and to the individual members of MSNJ to implement the Resolution calling for senior medical courtesy programs.

(3) Resolution #2—Repeal PRO Law . . . Approved referral of this Resolution to the AMA Delegation for preparation of an appropriate resolution to be introduced to the AMA House of Delegates.

(4) Resolution #5—Accountability of Claim Review Workers . . . Directed that the president or her designee send an appropriate letter to the State Board of Medical Examiners to implement this Resolution encouraging the SBME to consider that those making decisions with regard to payment should be held accountable in the same way as the treating physician is held accountable.

(5) **Resolution #6—Billing for Preparation of Medical Information for Third Parties . . .** Directed that an article on this Resolution be prepared by the president for publication in the *Membership Newsletter* and for inclusion in the President's Hotline.

(6) **Resolution #7—Confidentiality of Medical Information and Resolution #8—Unauthorized Release of Medical Information . . .** Referred these Resolutions to legal counsel for study and report back to the Board.

(7) **Resolution #9—Certification of Review Organizations . . .** Was referred to the Council on Legislation for development of appropriate legislation.

(8) **Resolution #10—Remove Alleged Birth-Related Neurological Injuries from Tort Law . . .** Agreed to withhold action pending receipt of a report on the study being conducted by the Medical Inter-Insurance Exchange of New Jersey.

(9) **Resolution #11—Telephone Information . . .** Was referred to legal counsel for study and report back to the Board.

(10) **Resolution #19—Physician Notification of Proposed Medicare Changes . . .** Directed that an appropriate letter be sent to the Health Care Financing Administration to

accomplish the action of this Resolution.

(11) **Resolution #21E—Medicare Deductibles and Co-Payments; Resolution #1—Freedom of Choice for Residency Program Directors; Resolution #13—Foreign Medical Graduates; and Resolution #16—Equality of Testing Foreign Medical Graduates . . .** Referred these Resolutions to the AMA Delegation for preparation of appropriate resolutions to be introduced to the AMA House of Delegates.

(12) **Resolution #15—Emergency Medical Services for New Jersey . . .** Was referred to the Committee on Emergency Medical Care for study and report back to the Board.

Unfinished Business . . .

(1) **PRO Contract . . .** Voted to file the letter from Dr. Kingsley requesting the support of MSNJ to accompany PRO's current bid for the New Jersey peer review contract.

New Business . . .

(1) **Resignation of Dr. Primich . . .** Expressed appreciation for Dr. Primich's service as chairman of the Council on Public Relations, upon his resignation.

(2) **Report of 1988 Annual Meeting . . .** Noted that the 1988 Annual Meeting was successful.

(3) **New Jersey Society for Medical Assistants . . .** Noted that a letter of commendation will be directed to the New Jersey Society of Medical Assistants for their voluntary staffing of the message center during the 1988 Annual Meeting.

(4) **AIDS Symposium . . .** Noted that the AIDS symposium was well received and the education program at future annual meetings will be videotaped and made available at cost to component medical societies.

(5) **Request for Endorsement of AIDS Study . . .** Referred the letter from Jack Elinson, Ph.D., requesting MSNJ endorsement of a proposed AIDS telephone survey to be conducted in New Jersey for educational purposes, to the Task Force on AIDS for evaluation and report back to the Board.

(6) **Board Workshop on Medical Inter-Insurance Exchange of New Jersey . . .** Authorized the president to collaborate with Dr. Mineur in the development of a one-day or half-day program for MIENJ to educate members about the company and its function.

(7) **Arthur Krosnick, M.D., Editor . . .** Noted a Resolution honoring Dr. Krosnick upon his resignation as editor of *NEW JERSEY MEDICINE*.

(8) **Resolution from Sussex County Medical Society—DRGs . . .** Referred a Resolution calling for MSNJ to request the New Jersey Department of Health to review the DRG assignments for certain categories of illness found to lack adequate reimbursement to hospitals and physicians to the Committee on Utilization Review Systems for consideration.

UMDNJ Notes

Stanley S. Bergen, Jr., M.D.
President

This spring, UMDNJ conferred more than 700 advanced degrees and certificates in the health sciences professions at its 15th annual commencement exercises, held at the Garden State Arts Center in Holmdel.

Commencement highlights included remarks by Philip K. White, vice-chancellor of the Department of Higher Education; and the awarding of honorary degrees to Dr. Albert Sabin, famed developer of the oral polio vaccine; Dr. June Jackson Christmas, founder of the Harlem

Rehabilitation Center and the first black president of the American Public Health Association; Dr. Marshall W. Nirenberg, a Nobel Prize recipient for advances in genetic research; and Wesley J. Howe, chairman of the board and chief executive officer of Becton Dickinson and Company.

In addition, UMDNJ presented distinguished alumnus awards to Anthony Volpe, D.D.S., M.S., a 1960 graduate of the charter class of the former Seton Hall University College of Dentistry, which now is UMDNJ-New Jersey Dental School; and Anthony DeMaria, M.D., a 1968 graduate of UMDNJ-New Jersey Medical School.

Included among the degrees and certificates presented were 17 masters of public health degrees to the third graduating class of the combined program between UMDNJ and Rutgers University; their degrees feature the seals of both institutions.

Medical degrees were awarded by school: UMDNJ-New Jersey Medical School (Newark), 165 M.D. degrees; UMDNJ-Robert Wood Johnson Medical School (Piscataway/New Brunswick), 101 M.D. degrees; UMDNJ-Robert Wood Johnson Medical School at Camden, 44 M.D. degrees; and UMDNJ-School of Osteopathic Medicine (Camden/Stratford), 45 doctor of osteopathy (D.O.) degrees.

Other degrees included UMDNJ-New Jersey Dental School (Newark), 73 doctor of dental medicine (D.M.D.) degrees; and UMDNJ-Graduate School of Biomedical Sciences (Newark), 12 Ph.D. degrees and one master of biodental science degree. In addition, 77 students received joint graduate degrees from Rutgers University and the UMDNJ-Graduate School of Biomedical Sciences (Piscataway), including 31 M.S. and 46 Ph.D. degrees.

The UMDNJ-School of Health Related Professions (Newark) awarded 188 certificates in a variety of health professions, including cytotechnology, nursing education, nurse-midwifery, dental hygiene and dental assisting, medical technology, physical therapy, and radiography. Certificates also were presented in programs operated jointly by the school and other educational institutions in respiratory therapy, toxicology, EMT-paramedic training, and phy-

sician's assistant. UMDNJ's physician's assistant program is rated the best in the nation, but graduates must leave the state to practice because New Jersey does not recognize the profession.

Visitors to our Newark campus are invited to drop by the Smith Library to view a display of memorabilia on the "Pioneer Women Physicians of New Jersey."

The exhibit is being mounted through December in celebration of the inauguration of Palma Formica, M.D., as the first woman president of the Medical Society of New Jersey. It focuses on 20 pioneer women, from the years 1830 to 1988, whose wide variety of achievements have made history in New Jersey.

Five living women are included in the exhibit. In addition to Dr. Formica, who is associate professor of clinical family medicine at our Robert Wood Johnson Medical School, they are: Drs. Laura Morrow, former American Medical Women's Association (AMWA) president and the first woman president of the New Jersey Psychiatric Association; Christine Haycock, associate professor of surgery at UMDNJ-New Jersey Medical School, former AMWA president and the first woman to transfer from the Nurse Corps to the Army Medical Corps; Eva Topkin Brodtkin, the first woman dermatologist in New Jersey, and the first woman president of the New Jersey Dermatologic Society; Mathilda Vaschek, the first woman medical director of a corporation in New Jersey (E.R. Squibb & Sons Pharmaceuticals, 1952) and the first woman chairman of the Occupational Medical Society of New Jersey; and E. Mae McCarroll, the first black woman appointed to Newark City Hospital and former president of the New Jersey State Medical Association.

New Members

The Medical Society of New Jersey would like to welcome the following new members:

Atlantic County

Jan K. Astin, M.D., Mays Landing
Mosses Bairamian, M.D.,

Absecon Highlands

Antoine Sayegh, M.D., Margate
David B. Slotoroff, M.D., Pomona

Bergen County

John B. Amodio, M.D., Teaneck

Marcelo F. Batkis, M.D., Paramus
Mark Berman, M.D., River Edge
John Blebea, M.D., Maywood
John E. Braun, D.O., Hillsdale
Alan J. Briker, M.D., Harrington Park
Michael C. Distefano, M.D., Hackensack
Michael G. Faust, M.D., Wyckoff
Mark D. Goldberg, M.D., Wayne
Chang H. Kang, M.D., Woodcliff Lake
Kathleen M. Kelly, M.D., Hackensack
Michael B. Kesselbrenner, M.D.,

Fair Lawn

Jeffrey Kocher, M.D., Englewood
Gregory J. Mulford, M.D., Teaneck
Ruth J. Schulze, M.D., Ridgewood
Philip O. Roux-Lough, M.D., Hackensack
Richard M. Schwab, M.D., Teaneck
Dovelet Shashou, M.D., Fort Lee
Diane G. Verga, M.D., Hawthorne
Martin R. Weinberg, M.D., Teaneck

Burlington County

Gerald C. De Tata, M.D., Tabernacle
Susan D. Entmacher, M.D., Mount Laurel
Phillip Glass, M.D., Moorestown
James M. Levett, M.D., Browns Mills
G. Tom Morea, M.D., Marlton
David M. Murphy, M.D., Browns Mills
Parveen Rashid, M.D., Mount Holly

Camden County

Mary Ann M. Ager, M.D., Cherry Hill
Steven A. Ager, M.D., Cherry Hill
James B. Alexander, M.D., Camden
Cleo J. Froix, M.D., Voorhees
George A. Knod, D.O., Camden
Ronald I. Leberman, M.D., Blackwood
Bryan J. McIntyre, D.O., Voorhees
Thomas J. Sergi, M.D., Haddonfield
Michael I. Sobel, D.O., Cherry Hill
Michael J. Yaros, M.D., Cherry Hill
Lee H. Yasgur, M.D., Cherry Hill

Cumberland County

John C. O'Donnell, Jr., M.D., Millville

Essex County

Bernard J. Beute, M.D., West Orange
Stephen M. Blumberg, M.D.,
New York, NY
Gregory B. Carson, M.D., Belleville

Physicians Seeking Location in New Jersey

**The following physicians have written
to the Executive Offices of MSNJ seek-
ing information on possible opportuni-**

**ties for practice in New Jersey. The in-
formation listed below has been sup-
plied by the physicians. If you are
interested in any further information
concerning these physicians, we sug-
gest you make inquiries directly to
them.**

ANESTHESIOLOGY—Kenneth Lum,
M.D., 7240 Twin Eagle Lane, Fort
Myers, FL 33912. Downstate 1985.
Board eligible. Available.

CARDIOLOGY—Donald G. Rubenstein,
M.D., 1037 3rd St., #303, Santa
Monica, CA 90403. Louisiana 1980.
Board eligible. Group or partnership.
Available August 1988.

DERMATOLOGY—Cheryl S. Citron,
M.D., 885 Sussex Rd., San Marino, CA
91108. Miami 1984. Board eligible.
Group, partnership, solo. Available.

ENDOCRINOLOGY—Robert P. Castel-
lucci, M.D., 3509 Kensington Ave., #3,
Richmond, VA 23221. St. George's
1982. Board eligible. Partnership or
group. Available September 1988.

FAMILY MEDICINE—John Travers,
M.D., 14225 Kendra Way, Poway, CA
92064. UMDNJ 1982. Group or HMO.
Available August 1988.

INTERNAL MEDICINE—Marc Hanfling,
D.O., 26 Glen Lane, Cherry Hill, NJ
08002. New York College 1981. Also,
cardiology. Board certified. Board
eligible (CARD). Group, partnership,
solo. Available.

Lalitha B. Iyer, M.D., 84 Hempstead
Dr., Somerset, NJ 08873. Madras
(India) 1980. Board eligible. Group,
partnership, emergency room. Avail-
able.

Joseph T. Wayne, M.D., 106 Elmwood
Dr., Prudenville, MI 48651. SUNY-Buf-
falo 1982. Also, pediatrics. Board
eligible. Board certified (PED). Also,
pediatrics. Group, partnership,
academic. Available October 1988.

Autoimmune Rheumatic Disease; Clinical Neuroimmunology; Food Allergy and Intolerance; The Merck Manual of Diagnosis and Therapy; Textbook of Immunology

Autoimmune Rheumatic Disease

John Morrow, Ph.D., David Isenberg, M.D. Boston, MA, Blackwell Scientific Publications, 1987. Pp. 324.

The text attempts to provide systematic and succinct updates on various systemic rheumatic disorders. The text integrates the basic science of the immune system as developed from animal models with human disorders. *Autoimmune Rheumatic Disease*, with its case presentations interspersed throughout the book, is better suited as a brief introductory text to these disorders for clinicians who wish to broaden their diagnostic capabilities.

The text is written clearly and illustrated to introduce physicians to the clinical aspects of these disorders with an added emphasis on their possible pathogenesis. Historical perspectives of each autoimmune process provide an excellent background to appreciate many facets of these disorders. Case presentations are interspersed throughout the textbook and can be viewed as a valuable learning reinforcement, but as unnecessary interruptions by others. The reference sections are extensive and current. Therapeutic intervention is delivered in a brief

fashion based on experimental approaches of therapy. The emphasis on animal models and experimental approaches to therapy provides an intuitive position with thought-provoking treatments that may be able to be applied to other disorders physicians may encounter in the future.

Overall, the text provides a clear-cut presentation of clinically useful immunological assays that commonly are used for these disorders; however, the text is too brief to provide any sort of meaningful review for rheumatologists.

Leonard Bielory, M.D.

Clinical Neuroimmunology

J.A. Aarli, W.M.H. Behan, and P.O. Behan, (eds). Boston, MA, Blackwell Scientific Publications, 1987. Pp. 531.

Extensive advances in the knowledge of the interaction of the immune and nervous systems have been made over the past several years leading to a separate entity known as neuroimmunology. Initially, this was the domain of the researcher with primary emphasis placed on the effects of vaccines and immunization on the nervous system of laboratory animals. However, it has become obvious that an understanding of the complex interactions of the immunological processes with the nervous system is needed for the advancement of clinical neurology.

This understanding of techniques and findings from bench to the bedside has offered the etiopathogenesis of prior unknown neuropathological disorders. This fundamental knowledge is needed for the diagnosis and for the advanced treatment of many of these neurological conditions.

This text apparently has been organized for the practicing clinician. The initial chapters provide the immunological background for the immunopathogenesis of many of the disorders. The leading international authorities on various aspects of "neuroimmunology" have been brought together in this text in order for the clinician to develop a fundamental framework of the neurological disorders. The illnesses discussed are not only those that primarily affect the central nervous sys-

tem but also systemic illnesses such as vasculitis, e.g. systemic lupus, erythematosus, and neoplasia where secondary, immune-mediated effects on the brain, peripheral nerves, and muscles are involved. A major emphasis is placed on various features associated with viral infections of the central nervous system and the various presentations that a viral infection may take. Controversy in the pathogenesis of suspected autoimmune disorders such as multiple sclerosis clearly are presented with reviews of other demyelinating disorders of the central and peripheral nervous systems, myasthenia gravis, and motor neuron disease. Unfortunately, there is an absence of a chapter directed towards the neuroimmunological complications of the acquired immunodeficiency syndrome. However, this does not detract from the excellently presented, organized, and well-written text. The references given at the end of each chapter reflect information available through 1986.

Overall, although primarily directed for clinical neurologists, the book also will appeal to other clinicians such as neuropathologists, psychiatrists, neurosurgeons, and any researcher interested in the field of neuroimmunology. This text provides a vital link for those interested in bench research as it reflects on the care of neurological conditions.

Leonard Bielory, M.D.

Food Allergy and Intolerance

Jonathan Brostoff, and Stephen J. Challacomb, M.D. Philadelphia, PA, Bailliere Tindall, 1987. Pp. 1,056. (\$125)

Food allergy is one of the last open areas of immunology in which there is considerable controversy regarding symptoms caused by "foods" and various methods used to diagnose and treat them. However, advances over the past ten years utilizing well-designed placebo-controlled clinical trials have helped elucidate immunologic, metabolic, and pharmacological reactions that identify food allergy or intolerance. In the past, allergists classically have defined "food allergy" in similar ways as to the classical allergic symptoms such as urticaria, asthma, anaphylaxis, and gluten-sensitive enteropathy.

However, with various unexplained behavioral, psychiatric, neurologic, and metabolic symptoms associated with the ingestion of various food-stuffs, some individuals consider these as "hypersensitivity" responses and consider that the classical symptoms listed above represent only a fraction of the total food allergy scenario.

In this text, the editors intentionally present both orthodox versus unorthodox viewpoints. They also state in their preface, "There is no suggestion that, because we have invited particular authors to contribute to our book, we necessarily agree with their view. Occasionally the reverse is true!" However, for the uninitiated practicing physician interested in the field of food allergy this presents a problem, since he unwittingly may accept the unorthodox views. This may be corrected if a person is willing to pursue the cited references. Even if one does so, it still is quite difficult to differentiate between speculation and scientific fact.

The text has five parts: 1—basic mechanisms; 2—food, components and their reactions; 3—end organ, effects, 4—diagnosis of food allergy and intolerance; and 5—treatment of food allergy.

Parts 1, 2, and 3 are well-written reviews of mucosal immunity and physiology on the cellular level and extending to the pharmacological and physiological effects on various organs. However, the last two parts of the book do not maintain the scientific caliber of the first two parts and integrate unorthodox as well as orthodox modes of diagnosis and treatment without clearly differentiating between the two.

Overall, the book is a well-written and versed text which complements the 1984 NIH publication (#84-2442) titled *Adverse Reactions to Food* published by the American Committee of Allergy and Immunology and the National Institute of Allergy and Infectious Diseases. The text presents a comprehensive, though not always critical, review for physicians and warrants reading by anyone interested in the area of food allergy with a caveat that unorthodox practices are integrated in

the text for completeness, and are not necessarily to be used in the clinical practice of medicine.

Leonard Bielory, M.D.

The Merck Manual of Diagnosis and Therapy, 15th Edition

Robert Berkow, M.D., (ed). Rahway, NJ, Merck & Co., Inc., 1987. Pp. 2,696.

"The first edition of the *Merck Manual of Materia Medica* was dated 1899. It contained 262 pages and was expressly designed to meet the needs of the general practitioners in selecting medications, noting that memory is treacherous..." Thus, starts the foreword to this latest edition, almost 90 years since its ancestor was born, and now containing ten times as many pages!

The *Merck Manual* of today continues to try to meet the needs of the physician to remember, recall, review, and relearn the volumes of information he needs, to treat his patients and to answer questions asked of them or of his colleagues, or of his students. The information presented here is in its typical compact form—easily managed, handled, and reviewed.

A total of 269 authors were engaged to work and complete the 15th edition, under the leadership of Robert Berkow, M.D., senior director of medical literature of the Merck, Sharp & Dohme Research Laboratory. The internal and external review procedures of every subject discussed and every treatment suggested, were repeated at least six times, to assure accuracy.

As in previous editions, disorders are organized according to organ system, or on basis of etiology or on basis of discipline. This edition has an extra 114 pages over the previous edition, with the inclusion of new subject matter pertaining to diagnostic and therapeutic procedures in gastroenterology, AIDS, reproductive endocrinology, oncology, management of severe and chronic pain, hyperbaric oxygen therapy, special considerations in the drug treatment of infants, children, and the management of geriatric problems.

It is difficult to believe that health service attendants can do better than using a *Merck Manual of Diagnosis and Therapy, 15th Edition* at their side for a timely review of pertinent information on any medical problems facing patients.

As in the past history of previous editions, the *Merck Manual* reader acceptance always has been favorable and it is believed this 15th edition also will be accepted.

Harry M. Poppick, M.D.

Textbook of Immunology. An Introduction to Immunochemistry and Immunobiology. Fifth Edition.

James T. Barrett, Ph.D. St. Louis, MO, C.V. Mosby Company, 1988. Pp. 455.

This is one of many textbooks on immunology written for a broad audience, more specifically for students of medicine and the paramedical sciences and those physicians searching for a basic text with clinical implications. Even though several excellent and extensive immunological reviews are available, they normally are too focused and too detailed for a clinician inexperienced in the field of immunology. The text provides a broad base and discussions on various items with additional readings without the necessity of a voluminous, commonly outdated bibliography. In addition, a brief appendix is included for those who are just entering and learning about the field of immunology. Included within the chapters are special situations in which a particular item is discussed further with possible clinical relevance. In addition, there are some chapters with "citation classics" in which outstanding citations are brought to the reader's attention and discussed. This appears to highlight important events in the evolution in the field of immunology.

In summary, the text is truly an introductory one for students of medicine and the paramedical sciences or those physicians who are uninitiated to the field of immunology. Leonard Bielory, M.D.

Dr. Elmer J. Elias

Specialist in physical medicine and rehabilitation, Elmer John Elias, M.D., died March 6, 1988, at the age of 83. A native of Trenton, and a life-long area resident, Dr. Elias received his medical degree from Jefferson Medical College of Philadelphia, in 1928. From 1929 to 1962, he maintained a private practice in Trenton. Affiliated with Mercer Medical Center, Dr. Elias served for many years as chief of the Department of Physical Medicine and Rehabilitation. In addition, he was public health officer for the city of Trenton. A diplomate in physical medicine and rehabilitation, Dr. Elias was a member of many organizations, including: the New Jersey Society of Physical Medicine, serving as president; the Association of Military Surgeons; the American Public Health Association; the New Jersey Health Association; the Academy of Medicine of New Jersey; the Royal Society of Health, London; the College of Physicians of Philadelphia; the American Congress of Physical Medicine and Rehabilitation; the American Medical Association; and our Mercer County component. An active member of the Medical Society of New Jersey, Dr. Elias was chairman of the Society's Committee on Rehabilitation, and a member of its Council on Public Health. He was a part-time instructor at Jefferson Medical College, and

was a consultant on physical medicine for the United States Postal Service. During World War II, Dr. Elias served in the United States Army medical corps, attaining the rank of major. In 1978, he received the Medical Society of New Jersey's Golden Merit Award, for 50 years of service as a physician.

Dr. H. Walter Evans, Jr.

Retired anesthesiologist H. Walter Evans, Jr., M.D., died on February 17, 1988, at the age of 65. Dr. Evans attended Hahnemann Medical College and Hospital, Philadelphia, receiving his medical degree in 1947. He was affiliated with Jersey Shore Medical Center, and was a member of our Monmouth County component and of the American Medical Association.

Dr. George H. Jackson

General practitioner George Harold Jackson, M.D., 83, died on July 8, 1987, in Port Perry, Ontario, Canada, where he had been retired since 1966. A native of Ontario, Dr. Jackson received his medical degree from the Faculty of Medicine, University of Toronto, Canada, in 1928. After maintaining a family practice in Union, Dr. Jackson was staff physician for Western Electric, Kearny, until his retirement. For 50 years as a physician, Dr. Jackson received MSNJ's Golden Merit Award in 1978. He was a member of our Essex County component and of the AMA.

Dr. Earl B. Keller, Jr.

Earl Blaine Keller, Jr., M.D., an obstetrician-gynecologist with the West Jersey Hospital System for 34 years, died on February 14, 1988, at the age of 74. Born in Philadelphia, Dr. Keller received his medical degree in 1939 from the University of Pennsylvania School of Medicine, Philadelphia. In 1946, after serving with the United States Air Force hospital unit in the China-India-Burma zone during World War II, Dr. Keller joined West Jersey Hospital. He maintained this affiliation until his retirement in 1980. Dr. Keller was selected chairman of the hospital's Department of Obstetrics and Gynecology (1960-1980), was elected president of the professional staff (1960), and was elected to the Board

of Trustees (1962). From 1980 to 1984, Dr. Keller was a surgical assistant at Zurbrugg Memorial Hospital, in Riverside. A diplomate in obstetrics and gynecology, Dr. Keller was a fellow of the American College of Obstetricians and Gynecologists, and of the American College of Surgeons, and was a member of our Camden County component and of the AMA.

Dr. Alexander Lewis

Former Rahway general practitioner, Alexander Lewis, M.D., 77, died on March 3, 1988. Born in Poland, Dr. Lewis attended Perugia University, Italy, where he received his medical degree in 1936. As well as maintaining a private practice in Rahway, Dr. Lewis was affiliated with Rahway Hospital, and was a member of our Union County component. Dr. Lewis received the Golden Merit Award in 1986.

Dr. Joseph A. Lucarella

Trenton cardiologist Joseph Anthony Lucarella, M.D., 55, died on March 4, 1988. A Trenton native, Dr. Lucarella was graduated from Jefferson Medical College of Philadelphia, Pennsylvania, in 1957. He maintained a private internal medicine practice in Trenton before beginning a cardiology fellowship at Hahnemann Medical College, Philadelphia. In 1966, he returned to Trenton to practice cardiology at St. Francis Medical Center, serving as chairman of the Cardiac Care Unit Committee, and as a member of the Quality Assurance Committee. As well as being an assistant professor in clinical medicine at Hahnemann Hospital, Dr. Lucarella also was affiliated with Helene Fuld Medical Center in Trenton. Dr. Lucarella was a member of our Mercer County component and of the American Medical Association.

Dr. Arnold J. Rosenthal

Retired general practitioner Arnold Jay Rosenthal, M.D., died on February 25, 1988, at the age of 77. A native of Newark, Dr. Rosenthal received his medical degree from the University of Zurich, Switzerland, in 1935. Affiliated with Newark Beth Israel Medical Center, Dr. Rosenthal was a member of our Essex County component and of the American Medical Association. In 1985, he re-

ceived the Medical Society of New Jersey's Golden Merit Award, for 50 years of medical practice.

Dr. Sheldon Rothfleisch

Plastic surgeon Sheldon Rothfleisch, M.D., 49, died on April 11, 1988, after more than 15 years of practice in New Brunswick. Born in New York, Dr. Rothfleisch received his medical degree from the University of Buffalo, in 1964. A diplomate in both surgery and plastic surgery, Dr. Rothfleisch was a fellow of the American College of Surgeons and of the New York Academy of Medicine, and was a member of our Middlesex County component and of the AMA. A resident of East Brunswick for the past 20 years, Dr. Rothfleisch was affiliated with St. Peter's Medical Center and Robert Wood Johnson University Hospital, both in New Brunswick; UMDNJ-Robert Wood Johnson Medical School, Piscataway; John F. Kennedy Medical Center, Edison; Raritan Bay Medical Center, Perth Amboy; and The Medical Center at Princeton. From 1965 to 1971, he was a United States Air Reserve captain.

Dr. Daniel Santor

Family physician Daniel Santor, M.D., 77, died on April 10, 1988, after maintaining a private practice in Berlin from 1942 to 1986. Born in Philadelphia, Dr. Santor attended the Faculty of Medicine, University of Rome, Italy, where he received his medical degree in 1937. In addition to his Berlin practice, Dr. Santor was affiliated with the West Jersey Health System, Southern Division, Berlin. For many years, he was physician for Edgewood High School,

Winslow Township, and worked for Lucas Paint Company-Sherwin Williams, Gibbsboro, from 1945 until its closing. A member of our Camden County component and of the AMA, Dr. Santor received the Golden Merit Award in 1987.

Dr. Harold A. Speirs

A family physician in Audubon for 32 years, Harold Archer Speirs, M.D., died on February 6, 1988, at the age of 59. A native of Philadelphia, Dr. Speirs received his medical degree from Jefferson Medical College, Pennsylvania, in 1955. A year later, he opened a private practice in Audubon, maintaining this practice until November 1987. Active in his community, Dr. Speirs served as school physician for the Haddon Heights Baptist High School. He was a member of our Camden County component, of the AMA, of the American Academy of Family Practice, of the Christian Medical Society, of the American Heart Association, and of the American Association of Retired Persons. Dr. Speirs served as a sergeant in the United States Army from 1945 to 1947.

Dr. Edward J. Wessel, Jr.

Former chief of staff and surgery at Newton Memorial Hospital, Edward Joseph Wessel, Jr., M.D., died on January 14, 1988, at the age of 55. Born in Mt. Holly, Dr. Wessel received his medical degree from the University of Pennsylvania, Philadelphia, in 1958. A specialist in general and traumatic surgery, Dr. Wessel became affiliated with Wallkill Valley General Hospital, Sussex, as well as Newton Memorial Hospital. A diplomate in surgery, and a fellow of the

American College of Surgeons, Dr. Wessel was a member of our Sussex County component, of the American Medical Association, and of the Academy of Medicine of New Jersey. From 1959 to 1962, he attained the rank of captain in the United States Army medical corps.

Dr. Howard M. Wiesler

Retired prison physician Howard M. Wiesler, M.D., 88, died on March 3, 1988, in Mesa, Arizona. A native of Cedarburg, Wisconsin, Dr. Wiesler received his medical degree from the University of St. Louis, Missouri, in 1924. From 1924 to 1934, he maintained a private practice in Trenton. In 1934, Dr. Wiesler became resident physician and later, medical director at New Jersey State Prison, where he practiced until 1972. A member of the American Medical Association and of our Mercer County component, Dr. Wiesler received MSNJ's Golden Merit Award in 1974.

Dr. Meyer H. Zuravin

Lakewood and Toms River urologist Meyer Harry Zuravin, M.D., 80, died on February 9, 1988. Born in Brooklyn, New York, Dr. Zuravin attended the University of Maryland School of Medicine, Baltimore, where he received his medical degree in 1932. He became affiliated with Kimball Medical Center, Lakewood, and Community Memorial Hospital, Toms River. Dr. Zuravin was a fellow of the American College of Surgeons, and was a member of our Ocean County component and of the AMA. During World War II, he served in the Army medical corps as a major. In 1982, Dr. Zuravin received the Golden Merit Award.

TELL YOUR PATIENTS THEIR CHOLESTEROL NUMBER... BEFORE THEY ASK.

Reducing high blood cholesterol reduces the risk of heart disease. That's why we're telling Americans—through a national public service advertising campaign—to know their cholesterol number. Your patients may soon be asking you for their number and what it means.

And when they do, we can help. The National Cholesterol Education Program, administered by the National Heart, Lung, and Blood Institute, has developed adult treatment guidelines to help you identify high-risk patients and use the appropriate diet and/or drug therapy for those with elevated cholesterol levels.

Help your patients reduce their risk of heart disease. For a free copy of the *Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults*, complete the form below.

**“A big insurance company
that helps me build my practice?**

**I don't
believe it.”**

**Believe it!
Medallion.
From Blue Cross and Blue Shield.**

You told us you wanted an insurance program that can help broaden your patient base. Your patients told us they wanted more comprehensive medical coverage.

We listened. And developed Medallion. The best insurance for a healthy practice...and your patients.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year inquiring about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you because with only a minimum of out-of-pocket expense, they will receive the maximum benefits of Medallion from a participating physician.

Comprehensive fee-for-service.

Medallion compensates you for the services you render while providing comprehensive care for your patients, including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not yet a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

1987 Transactions

The House of Delegates approved the Transactions of the 1987 Annual Meetings, as published in *NEW JERSEY MEDICINE*.

Action To Limit Debate

The House of Delegates, agreed, upon motion, that no one may speak more than once on any given subject except in rebuttal or by express permission of the House, and that floor time in each instance shall be limited to four minutes unless exception is made by the House.

Reports and Resolutions

Reports and resolutions and the actions, thereon, are included under the Reference Committee to which they were assigned. The House takes action only on the resolved sections of a resolution.

President/Chairman of Board of Trustees

HARRY M. CARNES, MD

(Reference Committee "A")

This has been a very active, exciting year at the Medical Society of New Jersey. Within a fortnight of my ascendance to the presidency, the Medical Society appeared before the Health and Human Resources Committee of the Assembly. With strong support from our general membership and reasoned responses to the committee members, we were able to defeat unanimously the onerous Mandatory Medicare Assignment Bill—2511.

The other major legislative victories have been: stalling of the physical therapy bill in the Assembly; stalling a bill to permit nurses to prescribe drugs; defeat of the optometric drug bill in the Senate; and passage in the Assembly of a bill precluding state agencies from creating licensed professions without specific legislative approval—specifically, physician assistants.

We were able to garner some tort reform measures, such as collateral sources, and joint and several liability, but were unable to get a vote on major tort reform in the Senate Judiciary Committee. Those bills pertained to structured settlements of large malpractice awards, and change in the statute of limitations. The failure of these reform measures was a bitter defeat, but we are going to reintroduce them and redouble our efforts.

It is my personal opinion that MSNJ possesses the talent, the resources, and, most importantly, the will to be a continuous major political force in this state. This is due in large part to the performance of JEMPAC, and the untiring efforts and superb leadership of Bill Ryan. At the present time, we have lines of communication open to all our elected (and to the major appointed) officials involved in health care in New Jersey.

The unexpected negative aspects of the State Commission of Investigation (SCI) Report released November 5, 1987, were frustrating at best. We were aware of, and had cooperated with, the SCI through our Physicians' Health Program. The professionally damaging aspect of this report was the subtle manner in which the SCI attempted to link physician malpractice and impairment with incompetence. This basic flaw undermines the credibility of the Commission.

In an attempt to defuse the issue, we chose not to formally respond to what was—at that time—a very negative media. Instead, we hired a very prominent attorney with excellent credentials: Judge Herbert J. Stern. We chose not to become involved in a prolonged legal battle through the courts, but to concentrate our efforts in the Legislature. Judge Stern has recommended to Senator Codey a proposal which will be fair to physicians and protect the public.

Medicaid reimbursement to physicians in this state could only be described as "obscene." However, we have been promised an increased fee schedule by Doctor Drew Altman, Commissioner of Human Services. He is to raise physician fees, and continue to revise the fee schedule yearly until it is equitable with the private sector. This is a tall order, but we have every confidence that Doctor Altman will maintain his word. Of course, legislative support will be required for such action. Our position looks promising at present.

Membership remains a continuing problem, and I see no end in sight. Despite strong efforts by my successor, problems remain. We must persist in our efforts to attract greater numbers of women and other minorities to membership in our Society.

The \$100 mandatory assessment for public relations voted by the 1987 House of Delegates remains with us. Approximately 75 percent of the membership has responded.

The "number one" topic and problem in medicine today is AIDS. I appointed Dr. Leon Smith to head the AIDS Task Force, to advise and educate the membership. A report will be presented to the House of Delegates at the Annual Meeting. The Task Force also has responsibility for the symposium scheduled for Sunday, May 1, 1988.

It has been my privilege to travel the state as your representative during the past 12 months. I have visited most of the counties, and have had multiple meetings with health care, legislative, and judicial leaders throughout the state. My heartfelt thanks to all who have worked on our committees, and to the staff for a magnificent job.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Judicial Council

PAUL H. STEEL, MD, CHAIRMAN

(Reference Committee "A")

From official findings, the Judicial Council presents a summary of its operations and those of county judicial committees for the period May 1987 through March 1988:

By Judicial Committees

Complaints reported as disposed of	74
Alleging:	
Dissatisfaction concerning fees	43
Dissatisfaction concerning medical procedures	16
Unprofessional conduct	5
Dissatisfaction concerning professional ethics	10

By Judicial Council

Meetings held	2
Official communications acted upon	150
Appeal hearings requested	3
Appeal hearings granted	0
Formal opinions rendered	2

1. Opinion of the Judicial Council Concerning Physician Responsibility Regarding AIDS Patients (Adopted August 5, 1987). Physicians have a long tradition of caring for patients afflicted with infectious diseases with compassion and courage. Not everyone is emotionally able to care for a patient with AIDS. If a doctor is unable to care for a patient with AIDS, that doctor should ask to be removed from the case.

In those instances where a physician chooses to remove himself/herself from the care of an AIDS patient, it is that physician's responsibility to make alternative arrangements for the proper care of the patient.

While the Council recognizes the right of the physician to determine which patients he/she will serve, it does not believe that a categorical refusal to treat patients with AIDS is morally or ethically acceptable.

2. Opinion of the Judicial Council Concerning Ethical Procedures in Second Surgical Opinions (Adopted August 5, 1987). The Judicial Council has received a number of inquiries from members regarding our prior opinion, Ethical Procedures in Second Surgical Opinion Programs. We have reviewed the available literature including statements made by the AMA Judicial Council and the New Jersey Board of Medical Examiners.

We believe the following opinion presents the best approach for physicians and patients in New Jersey:

- A. If a request for a second opinion comes from another physician, the second opinion physician may offer only an opinion in writing to the referring physician.
- B. If a request for a second opinion comes from an insurance company, the second opinion physician may offer an opinion to the insurance company in writing.
- C. If a second opinion is requested by a patient or his guardian, the second opinion physician is obligated to the patient or guardian.
- D. A second opinion physician should have no pecuniary relationship with the referring physician.

In items A and B, if a patient, after consulting with a second opinion physician wishes to use the service of this second opinion physician, this may be done by written consent obtained from the physician or the insurance company requesting the second opinion.

It is considered unethical for a second opinion physician to assume the care of the patient in question unless the above circumstances are met.

3. **Appeal Hearings.** The Judicial Council has scheduled a meeting for review and discussion of the three requests for appeal hearings from findings of County Judicial Committees.

4. **Judicial Council Opinions.** The Judicial Council agreed that, since their inception, many of its official opinions, due to dramatic changes in the practice of medicine, are outdated and inappropriate. This Council, at this writing, is in the process of revising and amending its listing of official opinions and when completed this annotated revision will be forwarded to all County Judicial Committees.

5. **Rules and Regulations.** The *Rules & Regulations of the Judicial Council for the Processing of Grievances and Complaints* was amended and forwarded to all County Judicial Committees.

6. **Assisting Surgeons.** The Judicial Council has received a number of complaints regarding charges by assisting surgeons. The following informational statement was forwarded to all County Judicial Committees:

When an assisting will be present, it is necessary that the primary surgeon so advise the patient and give the necessary details such as identity and fee to be charged. Please remember: the patient must agree to the presence of the assisting surgeon and the fee to be charged by the assisting surgeon.

Some surgeons have pointed out it is not always possible to provide specific detail before surgery. In those instances we expect the primary surgeon to generally inform the patient of the range of his fee, that an assisting will be present and will bill separately, and that assisting fees generally fall within a "reasonable" percentage of the primary surgeon's fee. If the surgeon does not have any idea of the relativity of the assisting's fees, he should just advise that the doctor will bill separately.

If, however, the assisting is required by law, i.e. Regulation of the State Board of Medical Examiners (13:35-4.1), rather than medical necessity that fact should be made clear to the patient.

7. **FTC Fee Issues.** The issue of binding fee adjudication by judicial committees has not yet been ruled on by the Federal Trade Commission. They have advised MSNJ that they do wish us to continue receiving and deciding fee cases in the interim regardless of their final decision.

8. **Judicial Mechanism Advertisement.** An ad for publication explaining the judicial mechanism is being developed by the Council on Public Relations at the request of the Judicial Council.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

AMA Delegation

KARL T. FRANZONI, MD, CHAIRMAN

(Reference Committee "A")

The American Medical Association has experienced a busy and productive year in fostering the interests of physicians.

ISSUES ADDRESSED BY AMA HOUSE

AIDS. Numerous activities addressed to the management of this major health scourge. All physicians are compelled to enhance their personal knowledge of this disease entity. Education is the current key to prevention of spread.

Professional Liability. Attempts to seek new pathways for resolution, including alternatives to the current tort system. The latter is bound to meet major resistance from plaintiffs, bar, civil liberties groups, and others.

Medicare Reimbursement. Continued negotiations to seek more equitable reimbursement for provided services. Seek withdrawal of participating, nonparticipating distinctions.

Nursing Shortage. A problem of national scope, impacting adversely on the quality of care. Leadership of medicine, nursing, hospitals, and fiscal providers must direct enhanced efforts to accomplish solutions.

Adolescent Health. Major and important educational thrust to be applied by all. Includes teen problems of suicide, pregnancy, and substance abuse.

Foreign Medical Graduates. AMA Board recommended creation of FMG section. House rejected this proposal. Interest is to have all FMGs mainstream their activities into already existent and available channels.

Relative Value Scale. Harvard study due for reporting this year. Considerable input from specialty societies. Will deal with issue of cognitive versus procedural reimbursement. Disagreement and controversy likely.

Smokeless Society. Continued efforts to accomplish this desirable goal by the year 2000.

Budget and Dues. Operating revenues of \$165,870,000, and operating expenses of \$163,090,000. No dues increase for 1988.

Membership has been expanding, but I heartily encourage your participation in a one-on-one campaign to solicit membership in the AMA by your fellow physicians. Regardless of the expressed basis of their disinterest, we require their involvement. Remember, the larger the body, the stronger the voice.

The 20 members of the Medical Society of New Jersey AMA Delegation stand ready, prepared, and able to champion the issues and causes espoused by MSNJ members. They solicit your communications.

We must enlarge and broaden the constituency responsible for decision making concerning health care matters. Physician groupings of themselves cannot create the numerical clout to invoke meaningful change. Public opinion as to the overall quality and rightness of our proposed solutions is essential. This goal requires active involvement, support, and sponsorship by all physicians on a continuing basis.

RESOLUTIONS INTRODUCED BY NEW JERSEY AMA DELEGATION

The following deals with resolutions which were introduced by the Medical Society of New Jersey into the AMA House of Delegates.

1. **Formation of a Section on Foreign Medical Graduates.** The AMA House of Delegates did not approve the establishment of a new Section for Foreign Medical Graduates.

Calling it an emotional and difficult issue, the Reference Committee cited a number of reasons why the new section would result in unmet needs and unfilled expectations among many FMGs:

- Mainstreaming of FMGs in organized medicine is already occurring, and will continue to occur for those who desire to be mainstreamed.

• Concern exists that a section may increase rather than diminish conflicts likely to arise from divergent points of view and the special interests represented by such a heterogeneous group.

• Convincing evidence is lacking regarding the likelihood that membership growth would result from the establishment of a section.

• Most of the issues of interest to FMGs are concerns shared by all physicians and are, therefore, appropriately addressed in a broader forum such as the House of Delegates.

The AMA House concurred with the Reference Committee's belief that FMGs should be encouraged to become actively involved within their local and state societies. (The final vote was 215 against the formation of a section and 145 in favor of its formation.)

2. Equality of Testing Foreign Medical Graduates. This Resolution asked that the AMA (a) urge the National Board of Medical Examiners (NBME) and the Educational Commission for Foreign Medical Graduates (ECFMG) to reach an agreement that graduates of foreign medical schools seeking an accredited residency may take NBME examinations to meet the examination requirement for ECFMG certification, and (b) that the AMA urge the NBME to admit graduates of foreign medical schools to its certification procedures as a means of meeting the examination requirements for licensure.

The Reference Committee heard extensive testimony for, and against, both resolves of the Resolution. Testimony indicated that the examination now used by the Educational Commission for Foreign Medical Graduates is equivalent to the Part I and Part II examinations of the National Board of Medical Examiners. The ECFMG examination is one requirement for the certificate of the ECFMG, which is required if graduates of foreign medical schools are to enter an accredited residency. The NBME, an independent organization, has limited admission to its Part I and Part II examinations to students in or graduates of medical schools accredited by the Liaison Committee on Medical Education (LCME).

The certification procedures of the NBME include not only the passing of its examinations but graduation from a medical school accredited by the LCME and the satisfactory completion of a residency accredited by the Accreditation Council for Graduate Medical Education. The certificate of the NBME may be accepted by a licensing authority in fulfillment of its examination requirement.

The Reference Committee was advised that LCME accredited schools are required to evaluate the ability of their students against known standards. Until an effective system to evaluate foreign medical schools can be implemented, the attributes of such schools are unknown and current procedures for the evaluation of graduates of foreign medical schools appear to be reasonable. The Resolution therefore was not adopted.

3. Hospitals Limited to Participating Physicians. This Resolution from New Jersey asked the AMA to urge Congress to rescind the incentive in the 1986 Budget Reconciliation Act regarding hospital referral of Medicare patients to "participating" physicians.

The AMA House adopted the following Substitute Resolution:

Resolved, that the American Medical Association advise its members that the decision of whether or not to be a "participating" physician in Medicare is a personal choice; and be it further

Resolved, that the AMA use all appropriate means to rescind those recently enacted regulations and statutes which unfairly discriminate against health care providers, and jeopardize the quality, availability, and affordability of health care for the aged and the infirm; and be it further

Resolved, that the AMA request Congress to return to the original intent of the Medicare Law (Title XVIII) as expressed in Sections 1801 and 1802 enacted in 1965; and be it further

Resolved, that the AMA specifically request Congress to rescind the "incentive" in the Omnibus Budget Reconciliation Act of 1986 regarding hospital referral of Medicare patients to participating physicians; and be it further

Resolved, that the AMA work to amend the Medicare law to eliminate any financial incentives to Medicare carriers for signing up large numbers of physician providers; and be it further

Resolved, that the AMA specifically seek to rescind, before its effective date of October 1, 1987, the Omnibus Budget Reconciliation Act of 1986 provision that requires a non-participating physician who performs an elective surgical procedure on an unassigned basis for a Medicare beneficiary to provide the beneficiary in writing the estimated approved

charge under Medicare, the excess of the physician's actual charge over the approved amount and the coinsurance applicable to the procedure.

4. **Forced Assignment on Laboratory Fees.** This Resolution calls on the AMA to oppose forced acceptance of Medicare assignment for diagnostic laboratory tests performed in physicians' offices, and calls the AMA to request repeal of this provision. The Resolution was adopted.

5. **Medicare Nonparticipation.** This Resolution called upon the AMA to advise its members that the Medicare "participation" decision is a personal choice, and to seek to rescind laws and regulations that discriminate against health care providers and jeopardize the quality, availability, and affordability of care for Medicare beneficiaries. The Reference Committee considered this Resolution with New Jersey's Resolution on Hospitals Limited to Participating Physicians. As previously noted, a Substitute Resolution was adopted.

6. **Physician Responsibility in Teaching Programs.** In this Resolution, the AMA was called upon to urge HCFA to alter its position on physician accountability in teaching programs so that residents and fellows are accountable for their own errors, and attendings are accountable only when they have failed to discharge their responsibility.

In December 1987, the AMA Council on Medical Education recommended against seeking a change in the Health Care Financing Administration policy to make residents and fellows accountable for their own areas and attending physicians accountable only when they have failed to discharge their responsibilities. The House of Delegates supported the Council's position.

MSNJ has taken the position that both the Council on Medical Education and the AMA Reference Committee have ignored the impossibility of this situation. HCFA has very clearly instructed the PRO that there is no discretion in teaching programs. Attendings are responsible for every error by students and residents, regardless of when or how the mistake occurred. Current HCFA policy requires PRO to proceed against the attending through several stages, including focused review. Time, resources, and expenses are wasted. Emotional trauma is inflicted on the attending, even though he/she is exonerated at a final PRO hearing.

Following the AMA Interim Meeting, David I. Kingsley, MD, President of The Peer Review Organization of New Jersey, and Robert J. Weierman, MD, Chairman of MSNJ's Committee on Utilization Review Systems, directed a joint communication to James H. Sammons, MD, Executive Vice-President of the AMA, asking for reconsideration. Doctor Sammons replied:

While I appreciate the risk to attending physicians from actions of physicians in training, residents or fellows, Report B of the Council on Medical Education is an affirmation of long-standing AMA policy. Resolution 36 clearly stated its intent to reduce the responsibility of an attending physician to his own actions, and the House of Delegates rejected that concept. There was no confusion; the issue was sharply defined. In the absence of a subsequent action to modify the position, I see no maneuvering room; the attending physician is the one physician responsible for the care of his or her patient in the hospital.

7. **Medicare Reimbursement—Maximum Allowable Actual Charges.** The Resolution calls on the AMA to seek legislative and regulatory changes that will correct the inequities in Medicare maximum allowable actual charges (MAACs) for nonparticipating physicians.

The AMA House of Delegates adopted the following Substitute Resolution:

Resolved, that the AMA continue to seek judicial, legislative, and regulatory changes that will eliminate the Medicare maximum allowable actual charge (MAAC) regulations for nonparticipating physicians; and be it further

Resolved, that, in the meantime, the AMA seek to assure that all Medicare fiscal intermediaries send to nonparticipating physicians adequate information for calculating MAAC levels; and be it further

Resolved, that the AMA support any individual component society's legal efforts to prevent passage or overturn any state law that restricts the right of physicians to contract for services rendered to their patients provided that:

a. The state association applies to the AMA; b. The Board of Trustees agrees that the litigation is meritorious; c. The Board will determine the extent of the support; and d. If the Board of Trustees determines that the request is without merit, it will inform that state association of the deficiencies of its approach.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Executive Director

VINCENT A. MARESSA

(Reference Committee "A")

The problems and difficulties facing the profession in New Jersey have magnified in the past year. While it is easy enough to distribute blame on a fair number of outside entities that engage in doctor bashing, it is futile to engage in activity that does not meaningfully address the issues. In effect, I am repeating the statement I made last year: we cannot continue the endless debate and internal bickering that is standard operating procedure for organized medicine.

Problems must be identified, strategies developed, and tactics executed to the best of our organizational ability. In order to produce such a system, we all will have to allow a certain amount of ego suppression. No course or response selected can satisfy everyone. That would be utopian—and, by definition, it does not exist. The task is not easy but it is by no means impossible.

The SCI report on impaired and incompetent physicians was inaccurate, unfair, and malicious, and could be equated to bureaucratic terrorism. The real issue is not the report nor the adverse publicity generated by it but what revisions will come about in our licensing laws. The Board has retained Judge Herbert Stern to assist in assuring that the outcome is effective, responsible, and rational. We, therefore, are focusing on the legislative challenge and putting aside the urge to lash out and get even.

The insurance commissioner has announced that practicing physicians who carry malpractice insurance will be surcharged 4 percent of their premium over the next seven years to make up the \$60 million deficit caused by the Department's misfeasance and malfeasance in operating the Malpractice Reinsurance Association. His plan is not final at this point. His plan is fatally flawed and ignores some basic facts. The Association was activated in order to compete with Medical Inter-Insurance Exchange of New Jersey (MIENJ). It was not activated because of an availability crisis. Its rates were set at a rate lower than MIENJ and it had no policyholder reserve. Its failure was a given.

It is inherently wrong, however, to charge its losses to persons never insured by it. It is inherently wrong to say that those insured by it should pay the same surcharge as those not insured by it. It is unfair and even stupid to say that those insured by it but no longer insured in New Jersey should have no obligation whatsoever. If the commissioner follows the course he has tentatively announced, MSNJ and MIENJ are committed to litigate against this unlawful and unfair plan. It is evident that state government can commit a version of malpractice. It is unfortunate that the governor and the Legislature are not more sensitive to that fact. The time is at hand when knowledgeable commissioners must make decisions that are sound and equitable rather than politically expedient.

The problems recited above are political, as are the solutions. We do need 1,000 to 2,000 doctors willing to call and write legislators and government executives. We need 6,000 members to contribute \$20 annually to political action committees. It is your profession and livelihood. You should be committed to its preservation and enhancement. You and you alone will determine the future of your profession, its form and substance. You will do this by the combined effects of your action and inaction.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Committee on Long-Range Planning and Development

BERNARD ROBINS, MD, CHAIRMAN

(Reference Committee "A")

The Committee met three times this year and, in response to the charge to look to the future for means to improve the structure and operation of the Society, considered:

1. **Nominating Committee Interview Format.** The procedure of conducting personal interviews of each prospective nominee for the positions of officers, trustees, judicial councilors, and AMA delegates and alternates introduced by the Committee on Long-Range Planning and Development was initiated during the 1986-1987 administrative year, and it was encouraging to learn that the procedure proved beneficial to the Nominating Committee.

The Board of Trustees, however, questioned the equitability of the new format and we were asked to look into videotaping the interviews. We did not feel inequities resulted because of the interview format; and did not believe the concept of videotaping was appropriate or useful. A recommendation that candidates be given the option to submit a written statement prior to the time of their interview, setting forth why they believe they are qualified to represent the physicians of New Jersey in the office they are seeking, and also to enclose their recent photograph was approved by the Board. Candidates to be interviewed by the 1988-1989 Nominating Committee will be advised of this option.

2. **Emeritus and Dues-Exempt Members.** The high ratio of emeritus and dues-exempt members was considered an appropriate issue to be studied. Currently, there are 1,800+ members who do not pay dues. Therefore, their Society financial obligations are incumbent upon the 7,700 dues-paying members. Data indicates that of the 880 members over age 70, 380 still are actively practicing; and of the 1,000 physicians in the emeritus category, about 310 still are practicing. We focused our attention on the question of whether the Society can carry an estimated 700 dues-exempt members who currently are working, and at what level should it be considered appropriate to pay dues. The increasing number of claims of financial hardship for reasons other than illness or disability was noted, and we agreed that the Society's policy to require documentation of economic need before members are placed in the dues-exempt category should be maintained. While the Bylaws provide that members who have attained the age of 70 years do not pay dues, it was our feeling that age 70 is not realistic today. The Committee, recognizing the natural tendency to be less productive at that age, has recommended to the Board that a dues reduction schedule be established for physicians over 70 who still are working. We also are recommending that retired physicians and/or out-of-state physicians, who are not members of the Society but wish to subscribe to certain services (*NEW JERSEY MEDICINE*, etc.), pay a fee-for-service for these services only.

3. **Informational Meetings of the General Membership.** The Committee spent much time studying possible ways to achieve a direct line of communication with the general membership of the Society and the officers and Board of Trustees that would be productive and accommodate the needs of the membership. We concluded that an expedient way to accomplish this would be to invite members of county medical societies to a specific meeting of the Board, at which they could participate in an open forum discussion of issues. The county forum would be placed as an item on the Board agenda. The concept has been recommended to the Board of Trustees.

4. **Educational Programs at Annual Meeting.** The question of what educational programs could be offered to promote physician interest and increase attendance at future Annual Meetings was studied. We were unanimous in believing the Society must maintain its educational role and that the Annual Meeting should be a platform for continuing medical education.

The Committee believes that the scientific session format should be re-established at the Annual Meeting. We have recommended that this concept be pursued, and that special emphasis be placed on the blending of major socioeconomic issues and scientific programs.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Committee on Long-Range Planning and Development

BERNARD ROBINS, MD, CHAIRMAN

(Reference Committee "A")

1. Emeritus and Dues-Exempt Members. An increasing number of members at or below the age of 65 are going into the emeritus category. The number of claims of financial hardship for reasons other than illness or disability also has been increasing. Currently, there are 1,800+ members who do not pay dues. Therefore, their Society financial obligations are incumbent upon 7,700 dues-paying members. The situation was discussed considerably by the Committee on Long-Range Planning and Development.

A study revealed that a significant number of dues-exempt members currently are working. It also showed that a substantial number of members over the age of 70 still are actively practicing. The Committee's recommendation, that the Society's policy to require documentation of economic need before members are placed in the dues-exempt category be continued, was approved by the Board of Trustees.

The Committee recommended that the following dues structure be implemented after age 70, and that eligible members be required to submit a formal request to participate in the dues reduction plan: age 71—member pays full dues; age 72—member pays 75 percent of dues; age 73—member pays 50 percent of dues; age 74—member pays 25 percent of dues; and age 75—dues-exempt/emergitus status.

The Board of Trustees approved the recommendation, which will be referred to the Committee on Revision of Constitution and Bylaws for development of a Bylaw amendment for approval of the 1989 House of Delegates. That Committee will determine whether to recommend the format we have developed or some other version.

A recommendation by the Committee, that emeritus physicians and/or out-of-state physicians, who are not members of the Society but wish to subscribe to certain services (*NEW JERSEY MEDICINE*, etc.) pay a fee-for-service for these services only, also was approved by the Board.

2. Informational Meetings for the General Membership. The development of a format for holding informational meetings for the purpose of disseminating information and giving the general membership the opportunity for feedback was studied by the Committee on Long-Range Planning and Development.

After considerable discussion of methods to achieve a direct line of communication with the general membership and the officers and Board of Trustees that would be productive and accommodate the needs of the membership, the Committee on Long-Range Planning and Development recommended that the president of the Society send letters to the county medical societies, inviting the general membership to attend a specific meeting of the Board of Trustees, to participate in an open forum discussion of issues. (This was not intended to restrict the open invitation to county and specialty societies that already exists.) The Board approved the recommendation. The new procedure will be implemented during the 1988-1989 administrative year.

3. Educational Program at the Annual Meeting. The advantages of holding a number of scientific sessions for CME credits, as formerly conducted at the Annual Meeting, were noted. It was recognized, however, that this format is not possible at the present time due to insufficient space at the hotels accommodating the Annual Meeting. The Committee was made aware that there is the possibility that facilities may be available in the future to accommodate three or four scientific sessions.

The Committee agreed the ultimate future goal of the Society should be the re-establishment of educational programs at the Annual Meeting.

The Board approved the recommendation of the Committee that the Medical Society of New Jersey proceed with the concept of holding scientific sessions at future Annual Meetings, recognizing that the sessions initially may have to be phased in, depending on the availability of required facilities, and that special emphasis be placed on the blending of major socioeconomic issues and scientific programs.

4. Review of MSNJ's Councils and Committees. In reviewing the Society's administrative councils, and standing and special committees, the Committee on Long-Range Planning and Development made the following recommendations:

a. *Advisory Committee to the Auxiliary.* The function of the Advisory Committee is being accomplished through the Auxiliary's liaison with the Board of Trustees. Also, the Bylaws provide for a member of the Auxiliary to be appointed by the president to serve on the Society's councils and committees, and this was observed as another means for promoting dialogue between the Society and the Auxiliary. It also was learned that the Auxiliary was in favor of discontinuing the Committee. The recommendation that the Advisory Committee to the Auxiliary be discontinued was approved by the Board of Trustees. (The action of the Board will be referred to the Committee on Revision of Constitution and Bylaws.)

b. *Committee on Medical Student Loan Fund.* Since most work on the medical student loan fund is performed by the chairman, the Committee on Long-Range Planning and Development questioned the need for appointing other than a chairman and a vice-chairman to serve on this Committee. The recommendation that the Committee on Medical Student Loan Fund consist of only two appointed members (a chairman and vice-chairman) rather than five appointed members, as stipulated in the Bylaws, was not adopted. The Board of Trustees was not in favor of giving two individuals the authority for administering the fund.

c. *Committee on Revision of Constitution and Bylaws; Committee on Long-Range Planning and Development.* The possibility of merging the standing Committee on Revision of Constitution and Bylaws and the Committee on Long-Range Planning and Development was considered. It was the conclusion of the Committee on Long-Range Planning and Development that the coalescence of the two committees would not be in the best interest of the Society. The Board agreed with the Committee's conclusion.

d. *Committee on Child Health.* The Board of Trustees approved the recommendations of the Committee on Long-Range Planning and Development that the Special Committee on Child Health be discontinued, and that the activities of the Special Committee on Maternal and Child Care be expanded to include the Special Committee on Child Health.

e. *Committee on Occupational Health, Workers' Compensation, and Rehabilitation.* The Committee on Long-Range Planning and Development recommended that the Special Committee on Occupational Health, Workers' Compensation, and Rehabilitation be discontinued; and that the activities of the Special Committee be assumed by the Council on Medical Services. The recommendations were approved by the Board of Trustees.

f. *Ad Hoc Committee on Health Care Reimbursement Policies.* Since the Ad Hoc Committee on Health Care Reimbursement Policies continues to be involved in current issues, the Committee on Long-Range Planning and Development recommended that it be changed to a special committee of the Society, to perform as originally charged. Also, that members of the Committee be appointed by the president, and include representatives from the major specialty societies. The recommendations were not adopted by the Board of Trustees. The Ad Hoc Committee on Health Care Reimbursement Policies will be disbanded and the Council on Medical Services will assume responsibility for its activities. (Doctor Formica, president-elect, indicated that she will review the membership of the Ad Hoc Committee and select individuals from that Committee to serve on the Council on Medical Services.)

5. Speaker and Vice-Speaker of the House of Delegates.

a. *Speaker and Vice-Speaker Positions.* In accordance with Chapter II, Section (b) of the Bylaws, the president appoints the speaker and vice-speaker of the House of Delegates. The concept of changing these from presidential appointments to elected positions was discussed by the Committee.

The following recommendations will be considered at the next regular meeting of the Board of Trustees, following the Annual Meeting, when the speaker of the House of Delegates can be present to address the concept:

(1) That the speaker and vice-speaker be elected by the House of Delegates through the Society's Nominating Committee process.

(2) That the term of office for the speaker and vice-speaker be for two years, and that they be limited to three such terms.

b. *Ex Officio Seat on Board of Trustees.* The recommendation of the Committee on Long-Range Planning and Development that the speaker of the House of Delegates be given a non-voting, ex officio seat on the Board of Trustees will be considered at the next meeting of the Board, following the Annual Meeting, when the speaker can be present to address the issue.

6. Leadership Seminar. The concept of offering educational seminars to provide a training program for potential leaders of the Society was introduced and will be discussed further at future meetings of the Committee on Long-Range Planning and Development.

The Reference Committee recommends that the supplemental report be filed.

HOUSE ACTION: Adopted. The supplemental report was filed.

Committee on Physicians' Health

RONALD I. FORSTER, MD, CHAIRMAN

(Reference Committee "A")

The following report details some of the activities for the past year:

1. **Program Name Change.** The Committee recommended and MSNJ's Board of Trustees approved renaming the program the Physicians' Health Program. The Committee will be renamed the Committee on Physicians' Health. This fits with similar program names in other states. Such a name change was endorsed at the AMA meeting in Chicago in October. It will resolve some of the misconceptions about the competence of program clients.

2. **The SCI Report.** The State Commission on Investigation (SCI) released a report on impaired and incompetent physicians that was highly critical of the MSNJ program, the malpractice insurance carriers, and the State Board of Medical Examiners. While there were some reasonable positive recommendations, we felt that the report was essentially biased (reviewed from the point of view of a prosecuting attorney addressing a criminal population) and unfair (it relied on half-truths and incomplete data in some of its conclusions). The net effect has been positive. It has rallied the support of the Society around the program and may well open the door to a major improvement in the current disciplinary system.

3. **AMA 8th National Conference on the Impaired Physician.** MSNJ and our program were well represented at this national meeting. Dr. Canavan and Rev. Reading were both faculty members at this conference.

4. **Physician Health Program Grant Fund/Treatment Loan Fund.** To comply with state law regarding distribution of monies received as a result of a raffle, the Treatment Loan Fund has been divided into two separate funds: The Treatment Loan Fund, developed from donations made by pharmaceutical companies and from a number of individuals, will provide low-interest loans to physicians and/or their families while the physician is in treatment and/or suspended from practice. The Grant Fund was developed for the distribution of monies received from the annual raffle. State law prohibits the lending of raffle proceeds. Monies must be granted.

5. **Annual Raffle.** The 1987 raffle proceeds increased the Grant Fund total with an additional \$34,082.59. The program's three raffles have netted \$47,057.59. Since last year's raffle, \$13,650.00 in grants have been distributed.

6. **Joint Conference with the State Board of Medical Examiners.** To date, we have been unable to reach a mutually convenient date for a joint meeting with the State Board of Medical Examiners Committee on Long-Range Planning and Development. Program staff will continue its efforts to arrange this conference.

7. **Adopt-a-Family Program.** Because of the success of the 1986 "Adopt-a-Family for the Holidays Program," the Physicians' Health Program again solicited the help of MSNJ's Board of Trustees, County Medical Societies, County Auxiliaries, and NJAOPS and its Auxiliary for this year's fund. A total of \$4,541 was collected. Cash gifts were distributed to seven physicians and their families. These included both MDs and DOs. Five children received Christmas and Hanukkah gifts at holiday time.

8. **AIDS.** The Committee recognized that the problem of AIDS within the medical community will become a significant reality in the foreseeable future and will have to be addressed. The Committee recommended that the Board of Trustees establish a task force representative of the various medical entities of the profession for the purpose of developing clear-cut policies and protocols for physicians diagnosed as having AIDS or found to have a positive HIV titer. It was agreed that the program would not accept the addition of AIDS-afflicted physicians as an additional "impaired" group. However, physicians already involved in the program as a result of drug or chemical dependency who subsequently develop a positive HIV titer will be eligible for extended assistance from the program.

9. **Drug Abuse Insurance for Society Members.** The Committee submitted a recommendation to the Board of Trustees requesting that a study be undertaken of the health insurance policies endorsed by MSNJ. The purpose of this study would be to evaluate the practicality of adding coverage for drug abuse. The Committee noted that it would be a contradiction for

organized medicine to support drug abuse as an illness and to deny its own members coverage because of inappropriately endorsed insurance.

10. **Statistical Summary.** A statistical illustration of our program's activities from September 7, 1982, through December 31, 1987 follows:

	<i>Number</i>	<i>Percentage</i>
<i>Total Cases</i>	403	100.0
MD	341	84.6
DO	33	8.2
DVM	8	2.0
Student	5	1.2
Other	16	4.0
Male	363	90.1
Female	40	9.9
<i>Primary Impairment</i>		
Alcohol	147	36.5
Drugs	128	31.8
Psychiatric	89	22.1
Senility	11	2.7
Other	28	6.9
<i>Referral Source</i>		
Colleague	200	49.6
Self	74	18.4
Family	42	10.4
State Board of		
Medical Examiners	22	5.4
County Medical Society	18	4.5
Treatment Center	19	4.7
Other	28	7.0

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Board of Trustees' Item

RESOLUTION #2 AND SUBSTITUTE RESOLUTION #2 (1987): X-RAY DEMONSTRATION OF CHIROPRACTIC SUBLUXATION

(Reference Committee "A")

These Resolutions deal with whether or not medical x-rays document the existence of chiropractic subluxation. Following the close of the 1987 Annual Meeting, the Board referred them to legal counsel for study.

In his report, legal counsel points out that the difficulty confronted is that chiropractic subluxation is not a medically recognized disease process or anatomical condition. The American College of Radiology maintains that radiologists interpret x-rays from a medical perspective and do not make chiropractic findings.

X-ray confirmation of subluxation was not an issue in the *Wilk* case which involved the AMA. The AMA reports that one study has been performed showing no intraobserver correlation in the interpretation of x-ray films by chiropractors and radiologists.

The difficulty presented by both Resolutions is the assumption that chiropractic subluxation is to be evaluated in terms of a medical diagnostic technique, while the law and the practitioners of chiropractic maintain it is totally different from concepts in medicine. Both Resolutions are inappropriate in attempting to correlate chiropractic into "medical care" and then to indicate that subluxation is not medically demonstrable. Chiropractic simply is not medical care.

In view of the above and the potential for litigation, legal counsel sees no practical benefit to adoption of either of the Resolutions. The state Legislature and Congress already know that chiropractic is not medical and is not based on medically recognized concepts.

The Board of Trustees supported legal counsel's opinion.

After considerable discussion, the Reference Committee suggested that physicians should concentrate on practicing optimal medical care and educating patients about the diagnostic and therapeutic limitations of limited licensed practitioners.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Resolution #3

Introduced by: Essex County Medical Society
Subject: Critical Bedside Nurse Shortage
Referred to: Reference Committee "A"

Whereas, there is an increasingly critical shortage of bedside nurses in both New Jersey hospitals and nursing homes; and

Whereas, there is a decreasing number of student nurses and a diminishing source of nursing education in the state of New Jersey; and

Whereas, adequate patient care requires a continuing supply of nurses; and

Whereas, any further reduction in bedside nurses will result in substandard patient care; now therefore be it

Resolved, that the Medical Society of New Jersey attempt to achieve the following:

- a) Seek private and public means of encouraging programs to produce more bedside nurses.
 - b) Solicit the Department of Higher Education to enlarge existing programs and to generate new programs, including three-year nursing schools.
 - c) Seek legislation to address this nursing shortage crisis.
 - d) Attempt to establish scholarships and student loan programs to encourage more nursing applicants.
 - e) Encourage career guidance counselors to promote awareness of opportunities in nursing.
- The Reference Committee considered Resolutions #3 and #20 jointly because of the similarity of the subject matter.

The Reference Committee recommends that Resolution #3 be rejected.

HOUSE ACTION: Adopted. Resolution #3 was rejected.

Resolution #4

Introduced by: Ocean County Medical Society
Subject: Inducting Osteopathic Physicians in County Medical Societies
Referred to: Reference Committee "A"

Whereas, it is deemed important to increase the number of physicians participating in medical activities at a county medical society level; and

Whereas, it is deemed important to increase county medical society membership by inducting osteopathic physicians into the county medical societies; and

Whereas, it currently is the rule that osteopathic physicians must join the Medical Society of New Jersey in order to qualify for a county medical society membership; and

Whereas, many osteopathic physicians are members of the New Jersey Association of Osteopathic Physicians and Surgeons and would join a county medical society but for the constraint of double dues; and now therefore be it

Resolved, that the osteopathic physicians who are active members of the New Jersey Association of Osteopathic Physicians and Surgeons be permitted to join a county medical society freed from the stipulation of first joining the Medical Society of New Jersey.

Osteopathic physicians currently are eligible for membership as regular members with the same rights and responsibilities as M.D.s under the existing bylaws, and the Reference Committee does not believe this policy should be changed.

The Reference Committee recommends that Resolution #4 be rejected.

HOUSE ACTION: Adopted. Resolution #4 was rejected.

Resolution #18

Introduced by: Bergen County Medical Society
Subject: Specialty Society Judicial Committee Review
Referred to: Reference Committee "A"

Whereas, judicial committees of county medical societies perform an invaluable function in handling complaints against member physicians; and

Whereas, these judicial committees often are requested to pass judgment on the quality of patient care which involves functions of such nature that only a specialist would be able to render judgment; and

Whereas, these county judicial committees would benefit from receiving consultations from experts in specialty fields; now therefore be it

~~Resolved, that the Medical Society of New Jersey Judicial Council request specialty societies in New Jersey to be ready to act as advisory panels for county judicial committees in cases involving quality of patient care; and be it further~~

~~Resolved, that the specialty society review functions be performed as quickly as possible and that the opinion be returned promptly to the inquiring judicial committee of the county society for final determination.~~

Resolved, that the Medical Society of New Jersey Judicial Council request specialty societies to provide expert reviewers to act in an advisory capacity to county judicial committees in cases involving quality of patient care.

The Reference Committee recommends that Resolution #18 be amended (italics indicate amendments).

HOUSE ACTION: Adopted. Resolution #18 was adopted as amended by the Reference Committee.

Resolution # 20

Introduced by: Bergen County Medical Society
Subject: Solving the Nursing Shortage
Referred to: Reference Committee "A"

Whereas, it is estimated there will be a need for 1.2 million nurses by the year 2000; and

Whereas, there is an increasing shortage of available nurses to staff our hospitals; and

Whereas, this shortage problem has been compounded by two factors: enrollment in nursing schools has dropped 20 percent, and four major nursing schools have closed; and

Whereas, the shortage can be noted by individual practitioners in the hospitals with regard to care of their patients and available operating room time for surgeons; and

Whereas, there appears to be no unified action by the state and county governments to address the nursing shortage; now therefore be it

~~Resolved, that the Medical Society of New Jersey, through the development of a new committee or a standing committee, combine its efforts with a similar committee from the New Jersey State Nurses Association; and be it further~~

~~Resolved, that this committee should actively and aggressively confront the shortage of nurses, and define the issues and reasons; and be it further~~

~~Resolved, that this problem be presented to members of state and county governments and the New Jersey Department of Health with the urgent request that aggressive action be implemented to increase the number of professional nurses and with the added goal of making nursing a desirable profession.~~

The Reference Committee considered Resolutions #3 and #20 jointly because of the similarity of the subject matter.

The Reference Committee recommends that the following Substitute Resolution for Resolution #20 be adopted:

Whereas, it is estimated there will be a need for 1.2 million nurses and technicians by the year 2000; and

Whereas, there is an increasing shortage of available nurses and technicians to staff our hospitals; and

Whereas, this problem has been compounded by two factors: enrollment in nursing schools has dropped significantly, and four major nursing schools have closed; and

Whereas, the situation has been noted by individual practitioners in the hospitals with regard to care of their patients and available operating-room time for surgeons; and

Whereas, there appears to be no unified action by the state and county governments to address the shortage of nurses and technicians; now therefore be it

Resolved, that the Medical Society of New Jersey, through the development of a new committee or standing committee, combine its efforts with similar committees from other associations *to address the shortage of nurses and technical personnel*; and be it further

Resolved, that this committee, *which will address the shortage of nurses and technical personnel*, should actively and aggressively confront the shortage of nurses and technicians and define the issues and reasons, such as:

(a) Adequate remuneration for their services; and

(b) Soliciting the New Jersey Department of Higher Education to enlarge existing programs and to promote accelerated educational programs in nursing and technical services; and

(c) Encourage career guidance counselors to promote awareness of opportunities in nursing and technical fields; and be it further

Resolved, that the problem of *the shortage of nurses and technical personnel* be presented to members of state and county governments and the New Jersey Department of Health with the urgent request that aggressive action be implemented to make technical and nursing careers desirable, and to increase the number of professional nurses and technicians.

HOUSE ACTION: Adopted. Resolution # 20 was adopted as amended by the Reference Committee with editorial changes (noted in italics) by the House.

Resolution #22E

Introduced by: Bergen County Medical Society
Subject: Senior Medical Courtesy Programs
Referred to: Reference Committee "A"

Whereas, the majority of county medical societies in New Jersey now have enacted, or are considering enacting, a program of financial medical assistance for the qualifying needy senior citizens; and

Whereas, immediate unified action by the physicians of the state of New Jersey now is imperative; now therefore be it

Resolved, that the Medical Society of New Jersey immediately encourage all the remaining county medical societies to adopt a similar financial medical assistance program *similar to the senior medical courtesy program*; and be it further

Resolved, that every physician member of the Medical Society of New Jersey be urged to participate in ~~this valuable program~~ *the senior medical courtesy program*; and be it further

Resolved, that every component society encourage dialogue on a frequent and regular basis *with senior citizens*.

This Resolution reemphasizes the Society's concern and regard for the needs of our senior citizens.

The Reference Committee recommends that Resolution #22E be adopted.

HOUSE ACTION: Adopted as amended by the House (amendments in italics).

1988 HOUSE OF DELEGATES

**Medical Society of New Jersey
222nd Annual Meeting
April 28 – May 1, 1988**

REFERENCE COMMITTEE “B”

REPORTS

Secretary

Treasurer

Committee on Finance and Budget

Committee on Annual Meeting

Nominations for Emeritus Membership

MEMBERS

Elmar G. Lutz, MD, Chairman

John S. Garra, MD

C. Clayton Griffin, MD

James F. Marley, MD

Gerald S. Packman, MD

Raymond S. Buch, MD, Alternate Member

Secretary

BERNARD ROBINS, MD

(Reference Committee "B")

The office of the secretary has continued its usual routines, primarily involving maintenance of membership records, correspondence, minutes of Board of Trustees' meetings, telephone inquiries, and completion of numerous questionnaires originating from various sources.

During the administrative year, the secretary attended the meetings of the Board of Trustees and the several committees of which he is chairman, member, or advisor.

Membership (as of December 31, 1987)

Active:	Paid	7,567	
	Exempt	863	
Resident:	Paid	189	8,619***
*Associate:	Paid		82
**Affiliate:	Paid		102
	Exempt		5
State Emeritus			986
Total			<u>9,794</u>
Provisional Residents (six months)			25
State Honorary			1
New and Reinstated Members:			
Active			496
Resident			105
*Associate			51
**Affiliate			3
Change of status			63
Transfers within the state			47
Transfers out-of-state and resignations			129
Members deceased			123
Members dropped			217
Active:			
a. Nonpayment of dues		144	
b. Did not comply with Bylaw requirements			
regarding continuing medical education		31	
c. New Jersey license suspended		2	
d. New Jersey license retired		1	
e. New Jersey license voluntarily surrendered		1	
Resident (nonpayment of dues)		28	
*Associate (nonpayment of dues)		9	
**Affiliate (nonpayment of dues)		1	
*Associate membership (nonlicensed in New Jersey) designates interns and residents.			
**Affiliate membership physicians who no longer practice in New Jersey.			
***Adjusted for transfers out-of-state, resignations, and deaths.			

A comparison of December 31, 1987, to December 31, 1986, by county shows the following net changes of active paid membership:

Atlantic	+ 2	Gloucester	0	Ocean	+12
Bergen	- 6	Hudson	- 20	Passaic	- 8
Burlington	+ 5	Hunterdon	+ 3	Salem	- 3
Camden	0	Mercer	- 2	Somerset	+ 1
Cape May	- 3	Middlesex	+13	Sussex	+ 2
Cumberland	0	Monmouth	+16	Union	- 3
Essex	- 53	Morris	+19	Warren	- 6

AMA Membership. A total of 9,205 members of the Medical Society of New Jersey maintain active membership in the AMA. The Society's representation in the AMA House of Delegates stands at ten delegates—one for each thousand members, or fraction thereof.

Credentials. The Committee on Credentials throughout the year reviewed and acted upon membership applications and their supporting credentials as submitted through the component societies. The following statistical breakdown reflects the Committee's activities during the period February 15, 1987, through February 14, 1988:

Received:	<u>Provisional Residents</u>		<u>Active</u>	<u>Grand Total</u>
	<u>*Associate</u>	<u>Licensed</u>		
	41	66	458	565
Reviewed and found:	<u>Provisional Residents</u>		<u>Active</u>	<u>Grand Total</u>
	<u>*Associate</u>	<u>Licensed</u>		
(A) Satisfactory	37	59	404	500
(B) Unsatisfactory	0	0	0	0
Pending:	4	6	36	46
Withdrew:	0	1	18	19
Grand Total	<u>41</u>	<u>66</u>	<u>458</u>	<u>565</u>

*Associate membership (nonlicensed in New Jersey) designates interns and residents.

The Committee extends appreciation to the directors and the secretaries of component societies, and to those who assist them, as well as the County Credentials Committees, for their cooperation in processing membership applications. It especially would be helpful to the Credentials Committee of the Medical Society of New Jersey if those who process credentials in the component societies would call specific attention to any deficiencies or questionable data being submitted on the application form. This procedure will help insure more accurate and speedy evaluation of credentials. The chairman wishes to thank his Committee members for their diligence and cooperation.

Membership Directory. The 1987 edition of the Membership Directory has been available for one year. Since the original distribution of 9,613 copies to members, 1,978 copies have been sold to others. It is anticipated that data sheets for the 1989 edition will be mailed to members in early summer 1988. Your cooperation in returning them promptly will be greatly appreciated.

A question was raised concerning a discrepancy between the total membership reflected in this report and the total number of AMA members from the Medical Society of New Jersey in this report. The executive director explained that the figure of 9,205 includes New Jersey physicians who may not necessarily be members of the Medical Society of New Jersey.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Treasurer

JOSEPH A. MICALÉ, MD

(Reference Committee "B")

These interim financial statements, prepared in accordance with generally accepted accounting principles, reflect the financial position and results of operation of the Medical Society of New Jersey through January 31, 1988.

Since they are interim statements, the figures are unaudited. A complete audit will be conducted of the books of the Society as of May 31, 1988, and an audited report prepared as of that date. A complete audit was made as of May 31, 1987.

Committee on Finance and Budget

MATIS A. FERMAGLICH, MD, CHAIRMAN

(Reference Committee "B")

The Committee on Finance and Budget met on Thursday, March 31, 1988, for the purpose of reviewing the proposed budget for the 1988-1989 fiscal year.

The proposed budget and the following recommendations were approved by the Board of Trustees on April 10, 1988, and are submitted to the House of Delegates for approval:

Recommendations

1. That the budget for the fiscal year beginning June 1, 1988, and ending May 31, 1989, in the amount of \$3,750,000 with \$2,537,000 to be raised through member assessments be adopted.

2. That the 1989 assessment be set at \$350 per regular dues-paying member. (The 1988 assessment was \$330.)

3. That the 1989 assessment be set at \$60 per member for affiliate members (no longer practicing in New Jersey). (The 1988 assessment was \$40.)

4. That the 1989 assessment for associate members (interns-residents licensed in New Jersey) and licensed residents, provided the individual is in a residency program entered upon within a reasonable time after his or her graduation from medical school, be set at \$25. (No change from prior year.)

5. That the 1989 assessment be set at \$10 per student for medical students. (No change from prior year.)

Medical Society of New Jersey Statement of Revenue and Expenses Proposed Budget Fiscal Year Ending May 31, 1989

The Reference Committee recommends approval of recommendations 1 through 5.

HOUSE ACTION: Adopted. The recommendations were approved.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Committee on Annual Meeting

ANGELO S. AGRO, MD, CHAIRMAN

(Reference Committee "B")

The construction of Resorts Taj Mahal Casino Hotel in Atlantic City will not be completed for the Medical Society of New Jersey's 1988 Annual Meeting scheduled for Thursday, April 28 to Sunday, May 1, 1988. Therefore, we were forced to change the site of the 1988 Annual Meeting.

The Committee reviewed proposals on available sites for the Annual Meeting submitted by: Trump Plaza Hotel and Casino/Atlantis Casino Hotel, Atlantic City; Showboat Hotel, Casino & Bowling Center/Sands Hotel, Atlantic City; and Sheraton Meadowlands Hotel, East Rutherford.

The Board of Trustees of the Medical Society of New Jersey at its September 20, 1987, meeting approved the recommendation that the 1988 Annual Meeting be held at the Sheraton Meadowlands Hotel in East Rutherford.

The following sites also have been investigated and rejected based on the present format demanding specific requirements, they do not have adequate space: Berkeley-Carteret/Asbury Park; Flanders Hotel/Ocean City; Hyatt Regency/Princeton; Loews Glenpointe Hotel/Teaneck; The Parsippany Hilton/Parsippany-Troy Hills; and Scanticon/Princeton.

The 1988 House of Delegates will meet on three consecutive days, beginning with its opening session on Thursday afternoon, April 28. The election will be held on Friday, April 29, and the last session of the House will be held on Saturday. Reference committees are scheduled to meet on Thursday and Friday afternoons (April 28 and 29). The Inaugural Reception and Dinner-Dance honoring President-Elect Palma E. Formica, MD, will be held on Saturday, April 30.

The general session, scheduled for 8:30 A.M., Sunday, May 1, will be on the topic of AIDS.

JEMPAC's Political Forum will be at 5:00 P.M. on Friday, April 29, followed by the JEMPAC Wine & Cheese Reception at 5:45 P.M. Senator Frank J. Lautenberg, who is running for reelection this year and the Republican challenger, General "Pete" Dawkins, have been invited as guest speakers.

Permission was granted by the management of the hotel to have 20 (6' x 8') exhibits in the hallway, a prime area on the second floor—the location for all meetings and functions.

The New Jersey Society of Medical Assistants again will sponsor the Message Center.

Housing applications were sent to all component medical societies, and copies have appeared in *NEW JERSEY MEDICINE*, the journal of the Medical Society of New Jersey.

The Advance Convention Program was mailed in March.

The 1987 House of Delegates approved the recommendations that the Committee on Annual Meeting consider the Meadowlands Complex, along with Resorts Taj Mahal Casino Hotel for the 1989 and 1990 Annual Meetings. These recommendations will be evaluated by the Committee. With the approval of the Board of Trustees, a report advising the site and date of the 1989 Annual Meeting will be circulated to all component medical societies, and appear in *NEW JERSEY MEDICINE*.

During a discussion of the reasons for the selection of the Sheraton Meadowlands Hotel for the 1988 Annual Meeting, the chairman of the Committee on Annual Meeting informed the Reference Committee of the reluctance of Atlantic City hotels to accommodate the Medical Society in an acceptable manner. A comparison of attendance figures for the last four years highlights a marked increase for this year: 1985—432; 1986—349; 1987—326; and 1988—464 (as of April 29, 1988).

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Nominations for Emeritus Membership

(Reference Committee "B")

The following nominations for election to emeritus membership at the 1988 Annual Meeting have been received from the component societies. Conforming to the provisions of the Bylaws, Chapter I—Membership, Section 1—Composition (d), all nominees have been members in good standing of a component society and who by reason of age or infirmity have retired from the active practice of medicine, or members of this Society who have been disabled by reason of military service.

Atlantic County

Earl I. Kanter, M.D., Margate; age 67
Max C. Peperik, M.D., Oceanville; age 63
Victor M. Ruby, M.D., Atlantic City; age 68
Sydney H. Starrels, M.D., Ventnor; age 64

Bergen County

Calvin Ackerman, M.D., Teaneck; age 54
Joseph C. Braun, M.D., Fort Lee; age 77
Barnett L. Elkin, M.D., Westwood; age 65
Herbert M. Eskwitt, M.D., Tenaflly; age 64
Rudolph Frank, M.D., Washington Township; age 65

Margaret E. Symonds, M.D., New Vernon; age 68
John A. Waraksa, M.D., Berkeley Heights; age 55

The Reference Committee recommends that the nominations be approved.

HOUSE ACTION: Adopted. The nominations were approved.

Nominations for Emeritus Membership

(Reference Committee "B")

The following additional nominations for election to emeritus membership have been received:

Essex County

Michael A. Del Pomo, M.D., Atlantic Highlands; age 64

Hudson County

Joseph F. Corless, M.D., North Bergen; age 70

Samuel D. Critides, M.D., Glen Ridge; age 67

Dominic A. Mauriello, M.D., Jersey City; age 68

Olindo W. Rosanelli, M.D., Montague; age 66

Morris Schapiro, M.D., West Orange; age 70

The Reference Committee recommends that the nominations be approved.

HOUSE ACTION: Adopted. The nominations were approved.

1988 HOUSE OF DELEGATES

Medical Society of New Jersey
222nd Annual Meeting
April 28 - May 1, 1988

REFERENCE COMMITTEE "C"

REPORT

Council on Medical Services
Resolutions #2, #5, #6, #7, #8, #9,
#10, #11, #12, #19, #21E, #23E

MEMBERS

Harold R. Reeve, MD, Chairman
Louis G. Fares, II, MD
Paul C. Royce, MD
Paul J. Schneider, MD
Bessie M. Sullivan, MD
John C. Baker, MD, Alternate Member

Council on Medical Services

JOSEPH W. FLEISHER, MD, CHAIRMAN

(Reference Committee "C")

1. **Blue Shield's Medallion Program.** Upon the request of the Board of Trustees, the Council on Medical Services reviewed certain aspects of the Blue Shield Medallion Program, at which time Charles L. Cunniff, MD, vice-president, Medical Affairs, Blue Cross-Blue Shield presented an informative report on the program.

After careful deliberation, the following recommendations were submitted to and approved by the Board of Trustees at its meeting on November 15, 1987:

- a. That the Society reject the proposal to advise the Society's membership that it is in their best interest to consider rejecting "participating" status in Blue Shield; and in its place, a balanced presentation in a general fact sheet format be released to assist the membership in rendering their own individual decisions regarding participation.
- b. That the Board be advised that the Council is opposed to the concept of differential/discriminatory reimbursements for identical services rendered whether a physician is participating or not, and saw no legal remedy possible. [This recommendation was amended and approved.]
- c. That the Board seek an independent legal opinion to determine whether the Blue Shield position that Pace-participants also are participants in Medallion is valid. The Board did engage a firm to research that point. It was determined that the Blue Shield action is lawful.
- d. That the Board should further explore the January 1980 directive by former Insurance Commissioner Sheeran, directing Blue Shield to include its membership of participating physicians in all their programs, and that if it is found that the directive requires Blue Shield to do this, legislative or administrative relief should be sought.

The opinion from outside counsel confirmed the validity of the above directive. The Society will discuss the matter with the commissioner of insurance.

2. **Resolution #30E—Uniform National Standards of Care.** Upon the request of the Board of Trustees, the Council studied 1987 Resolution #30E—Uniform National Standards of Care. After careful consideration, the Council submitted the following recommendation which the Board of Trustees approved unanimously as amended at its meeting on November 15, 1987:

That because of the thousands of variables, uniform standards of care cannot be formulated *at this time by our Society*. [Italics denotes amendment.]

3. **Resolution #13—Disability Benefit Forms.** The 1987 Resolution #13, Disability Benefit Forms, was referred to the Council on Medical Services for further study and development of appropriate methodology. This matter is under consideration by the Council and a report will be forwarded to the Board of Trustees as soon as possible.

The Reference Committee was concerned that there was no testimony regarding the content of the report of the Council on Medical Services. The Reference Committee felt that there were several critical issues which should have been addressed with regard to the Blue Shield Medallion Program.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Resolution #2

Introduced by: Essex County Medical Society
Subject: Repeal PRO Law
Referred to: Reference Committee "C"

Whereas, the federal PRO law is both a subtle, implicit, and an actively explicit barrier between the patient and the attending physician's best judgment of the patient's medical management; and

Whereas, the federal PRO makes patently unfair decisions to patients and to their physicians by use of retrospective observations totally unavailable to and unpredictable by the physicians responsible for immediate medical decisions; and

Whereas, the federal PRO, by its adverse decisions, often unfairly denigrates the attending physician's reputation for professional competency and honesty in the eyes of his patients; and

Whereas, the federal PRO often does not provide due process to the attending physician regarding adverse decisions; and

Whereas, the federal PRO, by law, must make decisions from a patient's record which do not adequately account for the clinical impressions, judgment, and instincts of the attending physician and recognize that the art of medicine cannot be scientifically measured and rarely articulated; now therefore be it

Resolved, that the Medical Society of New Jersey adopt a position for the repeal of the federal PRO law; and be it further

Resolved, that the Medical Society of New Jersey place a resolution to this effect before the June annual meeting of the AMA so that they actively may seek the repeal of this law.

There was testimony expressing marked dissatisfaction with the present PRO system and for this reason the Reference Committee suggested the insertion of an additional resolved.

The Reference Committee recommends the addition of the following resolved immediately after the first resolved:

Resolved, that the AMA, in conjunction with the state medical societies and the specialty societies, formulate an alternative form of review to comply with the intent of the federal law; and be it further

HOUSE ACTION: Not adopted.

The Reference Committee recommends that Resolution #2 be adopted as amended.

HOUSE ACTION: Not adopted. Resolution #2 was adopted in its original form.

Resolution #5

Introduced by: Hospital Medical Staff Section
Subject: Accountability of Claim Review Workers
Referred to: Reference Committee "C"

Whereas, third-party payors are becoming increasingly involved in decision making in regard to testing, hospital admissions, and procedures for patients; and

Whereas, these decisions appear to be made by nonphysicians; and

Whereas, these decisions can greatly affect quality of care; and

Whereas, the decisions seem to be made more on controlling costs than on quality of care; now therefore be it

Resolved, that MSNJ encourage the New Jersey Board of Medical Examiners to consider that those making decisions (either physician or nonphysician) with regard to *payment for* testing, hospital admissions, and procedures for patients should be held accountable in the same way as the treating physician is held accountable for the care of the patient.

The Reference Committee heard testimony that claim review organizations are making patient care decisions, which are, in essence, the practice of medicine, and therefore these organizations must be responsible for the patient care decisions they make.

The Reference Committee recommends that the resolved be deleted and amended to read as follows:

Resolved, that MSNJ encourage the New Jersey Board of Medical Examiners to consider that those making patient care decisions (physicians, nonphysicians, or corporate entities) should be held accountable in the same way as the treating physician for the care of the patient.

HOUSE ACTION: Not adopted.

The Reference Committee recommends that Resolution #5 be adopted as amended.

HOUSE ACTION: Not adopted. Resolution #5 was adopted as amended by the House (*italics indicate amendments*).

Resolution #6

Introduced by: Hospital Medical Staff Section
Subject: ~~Billing for Multiple Claim Forms~~ *Preparation of Medical Information for Third Parties*
Referred to: Reference Committee "C"

~~Resolved, that MSNJ remind its membership that except for one claim form, they have the right to bill appropriately for preparation of medical information for third parties.~~

Resolved, that MSNJ remind its membership that except for claim forms, they have the right to bill third parties appropriately for preparation of medical information.

The Reference Committee recommends that the subject of Resolution #6 be changed to "Billing for Preparation of Medical Information for Third Parties."

HOUSE ACTION: Adopted. The subject of Resolution #6 was changed (italics indicate amendments).

The Reference Committee recommends that the resolved be deleted and amended (italics indicate amendments).

HOUSE ACTION: Adopted. The resolved was deleted and amended.

The Reference Committee recommends that Resolution #6 be adopted as amended.

HOUSE ACTION: Adopted. Resolution #6 was adopted as amended by the Reference Committee.

Resolution #7

Introduced by: Hospital Medical Staff Section
Subject: Confidentiality of Medical Information
Referred to: Reference Committee "C"

Resolved, that MSNJ remind its membership that it is unethical to release patient information without written authorization from the patient.

The Reference Committee recommended that Resolution #7 be adopted with the following editorial change: delete the word "unethical" and substitute "illegal."

Seymour F. Kuvin, MD, suggested the following amendment for Resolution #7:

Resolved, that MSNJ remind its membership that it is illegal to release patient information, unless there is an imminent danger to others, other written authorization from the patient.

HOUSE ACTION: Not adopted. Resolution #7 and all suggested amendments were referred to the Board of Trustees for action.

Resolution #8

Introduced by: Hospital Medical Staff Section
Subject: Unauthorized Release of Medical Information
Referred to: Reference Committee "C"

Resolved, that MSNJ remind its membership that they have the right to say "no" to any request for medical information except from the patient or his designated legal representative.

The Reference Committee recommends that Resolution #8 be adopted with the following editorial change: delete the word "legal" before the word "representative."

Seymour F. Kuvin, MD, suggested the following amendment for Resolution #8:

Resolved, that MSNJ remind its membership that they have the right to say "no" to any request for medical information except from the patient or his designated legal representative, unless there is imminent danger to others.

HOUSE ACTION: Not adopted. Resolution #8 and all suggested amendments were referred to the Board of Trustees for action.

Resolution #9

Introduced by: Hospital Medical Staff Section
Subject: Certification of Review Organizations
Referred to: Reference Committee "C"

Whereas, providers of medical services, both physicians and hospitals, recently have been deluged by various private insurers for the purpose of effecting concurrent review of medical necessity; and

Whereas, such reviews definitely are self-serving for the insurance companies; and

Whereas, the New Jersey Department of Health has officially recognized only certain utilization review organizations to perform such tasks; now therefore be it

Resolved, that MSNJ seek appropriate regulatory or legislative efforts to assure that all reimbursement and approval reviews are conducted by utilization review organizations approved by the New Jersey Department of Health.

Resolution #9 addresses an important problem which is complex and the Reference Committee feels that further consideration is needed.

The Reference Committee recommends that Resolution #9 be referred to the Board of Trustees for further study and action.

HOUSE ACTION: Adopted. Resolution #9 was referred to the Board of Trustees for further study and action.

Resolution #10

Introduced by: Anthony P. Caggiano, Jr, MD, Delegate, Essex County
Subject: Remove Alleged Birth-Related Neurological Injuries from Tort Law
Referred to: Reference Committee "C"

Whereas, professional liability insurance for obstetricians and gynecologists is becoming more difficult to secure and, when available, only at extremely high premiums; and

Whereas, 25 percent of ob/gyn physicians could not obtain professional liability coverage in Virginia; and

Whereas, Virginia, followed by Florida, sought an innovative approach to the problem and removed birth-related neurological injuries from the tort system; and

Whereas, ob/gyn physicians then became insurable for malpractice as a coverable surgical specialty; and

Whereas, this mechanism could apply, in the future, to other specialties or procedures; now therefore be it

Resolved, that the Medical Society of New Jersey actively seek legislation similar to the 1987 Virginia Birth-Related Neurological Injury Compensation Act; *and be it further*

Resolved, *that the Medical Society of New Jersey and the Medical Inter-Insurance Exchange of New Jersey look at the possibility of developing this concept for other types of professional liability injuries.*

The Reference Committee heard testimony emphasizing the plight of ob/gyn specialists and feels that the Resolution has merit and possible application to other areas of tort law.

The Reference Committee recommends the addition of four words and a resolved (noted in italics).

HOUSE ACTION: Adopted.

The Reference Committee recommends that Resolution #10 as amended be referred to the Board of Trustees for study and action.

HOUSE ACTION: Adopted. Resolution #10 was adopted as amended and referred to the Board of Trustees for study and action.

Resolution # 11

Introduced by: Union County Medical Society
Subject: Telephone Information
Referred to: Reference Committee "C"

Whereas, over the past year it has become increasingly common for health care agencies to request diagnoses and treatment plans from physicians over the telephone; and

Whereas, these agencies have been persistently more demanding in the pursuit of information; and

Whereas, these agencies, at times, have threatened to withhold benefits if the information was not provided; and

Whereas, these agencies are operating from bases outside the state of New Jersey; now therefore be it

Resolved, that this is the position of the Medical Society of New Jersey that it is unethical for member physicians to provide information over the telephone concerning a patient, other than to the patient, his family, or lawful representatives; and be it further

Resolved, that the proper response of a physician to such a request for telephone information would be to request a written authorization from the patient and a written explanation of what is necessary from the agency.

The Reference Committee agreed with the intent of Resolution #11, but felt that specific changes were necessary to clarify the concept.

The Reference Committee recommends that the first resolved be deleted and amended to read as follows:

Resolved, that it is the position of the Medical Society of New Jersey that it is improper for a member physician to provide patient information over the telephone to third-party carriers or health care agencies unless the patient has given written authorization.

HOUSE ACTION: Not adopted.

The Reference Committee recommends that the second resolved be deleted.

HOUSE ACTION: Not adopted.

The Reference Committee recommends that Resolution #11 be adopted as amended.

Seymour F. Kuvin, MD, suggested the following amendment for Resolution #11:

Resolved, that it is the position of the Medical Society of New Jersey that it is unethical for member physicians to provide information over the telephone concerning a patient, other than to the patient, his family, or lawful representatives unless there is an imminent danger to others; and be it further

HOUSE ACTION: Not adopted. Resolution #11 and all suggested amendments were referred to the Board of Trustees for action.

Resolution #12

Introduced by: Union County Medical Society
Subject: Reimbursement for Extraordinary Forms
Referred to: Reference Committee "C"

Whereas, it has become increasingly popular for health care agencies to request information over the telephone; and

Whereas, it is unethical for a physician to supply such information over the telephone; and

Whereas, it is the position of the Medical Society of New Jersey that it is appropriate to supply this information only on written authorization from the patient, and in written form; now therefore be it

Resolved, that it is appropriate and proper for the physician to charge a reasonable fee for completion of this type of extraordinary information form; and be it further

Resolved, that a request for information by any agency be considered an extraordinary form for which a fee can justifiably be requested.

The Reference Committee felt that Resolution #12 addressed an important issue which already had been covered by Resolution #6.

The Reference Committee recommends that Resolution #12 be rejected.

HOUSE ACTION: Adopted. Resolution #12 was rejected.

Resolution #19

Introduced by: Bergen County Medical Society
Subject: Physician Notification of Proposed Medicare Changes
Referred to: Reference Committee "C"

Whereas, Medicare reimbursement for all medical services is changing due to complicated unforeseen legislative and economic needs; and

Whereas, patient care and medical practice require current and appropriate medical laboratory testing and procedures; and

Whereas, physicians using or considering the use of their own laboratory facilities and/or purchase of new equipment need honest and current Medicare reimbursement information; and

Whereas, Prudential Medicare has unilaterally, and without any notification to physicians, changed Medicare reimbursement policies, now therefore be it

~~Resolved, that the Part B Medicare carrier be requested to notify the Medical Society of New Jersey and appropriate medical specialty societies six months in advance of anticipated revenue-saving reimbursement policy changes to allow time for comment and discussion; and be it further~~

~~Resolved, that Prudential Medicare be requested to notify all physicians in a forthright and clear manner three months in advance of regulated changes in reimbursement policies so that adequate time is allowed to prepare for these changes.~~

Resolved, that the Health Care Financing Administration be requested to notify the Medical Society of New Jersey and appropriate medical specialty societies six months in advance of anticipated revenue-saving reimbursement policy changes to allow time for comment and discussion; and be it further

Resolved, that the Health Care Financing Administration be requested to notify all physicians in a forthright and clear manner three months in advance of regulated changes in reimbursement policies so that adequate time is allowed to prepare for these changes.

The Reference Committee heard testimony on both sides of this issue but feels that implementation is not feasible since the Part B Medicare Carrier does not receive timely information from the Health Care Financing Administration.

The Reference Committee recommends that Resolution #19 be rejected.

HOUSE ACTION: Not adopted. Resolution #19 was adopted as amended by the House.

Resolution #21E

Introduced by: Union County Medical Society
Subject: Medicare Deductibles and Co-Payments
Referred to: Reference Committee "C"

Whereas, federal law requires physicians when accepting Medicare assignment to bill for the deductible and co-payment; and

Whereas, the public in many instances assumes that "accepting assignment" means no additional bill from physicians; now therefore be it

~~—Resolved, that the AMA petition the federal government to appropriately and adequately apprise the public that when a physician accepts Medicare assignment, the physician is required by law to bill for deductibles and co-payments.~~

Resolved, that the AMA petition the federal government to appropriately and adequately apprise the public that physicians accepting Medicare assignments are required by law to bill for deductibles and co-payments.

The Reference Committee recommends that the resolved be deleted and amended (italics indicate amendment).

HOUSE ACTION: Adopted.

The Reference Committee recommends that Resolution #21E be adopted as amended.

HOUSE ACTION: Adopted. Resolution #21E was adopted as amended by the Reference Committee.

Resolution # 23E

Introduced by: Atlantic, Burlington, Camden, and Gloucester County Medical Societies
Subject: Adjustment of Medicaid Fees
Referred to: Reference Committee "C"

Whereas, Medicaid fees have not been increased since 1971; and
Whereas, there are few physicians accepting Medicaid patients; and
Whereas, there is an increased need for medical care to the indigent; and
Whereas, the present Medicaid fees are unrealistically low; and
Whereas, Medicaid patients frequently receive medical care at emergency centers at a higher cost to the state; now therefore be it

~~**Resolved**, that the Medical Society of New Jersey direct its efforts toward encouraging appropriate state authorities to adjust Medicaid reimbursement to a level comparable with Medicare reimbursement for physicians' services.~~

***Resolved**, that the Medical Society of New Jersey reinforce its previous efforts (Resolution #2—1981) toward encouraging appropriate state authorities to adjust Medicaid reimbursement to a level comparable with usual, customary, and reasonable reimbursement for physicians' services; and be it further*

***Resolved**, that physicians be reimbursed for all costs related to the additional charges necessitated by federally mandated surcharges for biological materials and their administration since January 1, 1988; and be it further*

***Resolved**, that the Medical Society of New Jersey support and encourage to its fullest capacity the continuing efforts of the Committee on Medicaid.*

The Reference Committee heard lengthy discussion on the critical state of medical care for the indigent population of the state due in large measure to the penurious policy of the state legislature. It applauds the tireless efforts of the Committee on Medicaid in functioning under the most frustrating circumstances.

The Reference Committee recommends that the first resolved be amended (noted in italics).

HOUSE ACTION: Adopted.

The Reference Committee recommends the addition of another resolved (the third resolved—noted in italics).

HOUSE ACTION: Adopted.

The Reference Committee recommends that Resolution #23E be adopted as amended.

HOUSE ACTION: Adopted. Resolution # 23E was adopted as amended by the House; the House adopted the middle Resolved.

Council on Legislation

IRVING P. RATNER, MD, CHAIRMAN

(Reference Committee "D")

This report presents a summary of the ultimate status of legislative measures of the 202nd Legislature. The Council's operations, together with a cumulative report of MSNJ's official positions on current legislation, are reflected regularly in the official bulletins dispatched to state legislative keymen and to component societies, and in items published in the Membership Newsletter in *NEW JERSEY MEDICINE*, the journal of the Medical Society of New Jersey.

The Council on Legislation continues to invite an official representative from each specialty society to all Council meetings. A notice announcing the date of each of the Council's meetings also is sent to all MSNJ Official Intermediaries with New Jersey specialty societies.

The Council urges that more representatives attend its meetings so that it may have the benefit of the timely thinking of specialty societies concerning proposed legislation affecting the specialty fields.

The Council also invites the Chairman or representatives of each Council and Standing Committee to attend the legislative meetings. Recent bylaw amendments make it possible for one Auxiliary member, one resident member, and one student member appointed by the President, to serve on the administrative councils and committees for a one-year term, to be full voting members of the representative council and committees.

Every other month there is a special section in *NEW JERSEY MEDICINE* dealing with legislative and regulatory updates. The status of all active MSNJ legislative matters is detailed.

Of the bills reported to the House from the First and Second Sessions of the 202nd Legislature the following were signed into law:

S-1089—Provides immunity from liability for medical personnel who take breath, blood, or urine samples at request of police. **Approved.**

S-1316—Creates a task force on adolescent pregnancy to make recommendations to the governor and the Legislature. **Approved.**

S-1990—Authorizes the Commissioner of Human Services to establish a confidential reporting system by practitioners to the Commission for the Blind. **Approved.**

S-2708—Reduces damages in personal injury cases by any collateral sources of income. **Approved.**

S-2709—Provides for arbitration of tort claims when a judge determines the amount in controversy is \$20,000 or less. **Approved.**

A-1095—Requires all hospital service contracts to include services and products rendered at home under the supervision of a state-approved hemophilia treatment center. **Approved.**

A-1096—Same as **A-1095**—applies to group health insurance contracts. **Approved.**

A-1097—Same as **A-1096**—applies to individual health insurance contracts. **Approved.**

A-1473—Adds medical physics and epidemiology to the types of training of members of the Radiation Protection Commission. Also adds two new members to the Commission. **Approved.**

A-1813—Revises the law concerning commitments to psychiatric facilities. **Approved.**

A-2467—Extends the "Good Samaritan Act" to first aid and ambulance squad members. **Approved.**

A-2733—Provides specialized services to low-income women (prenatal) and their babies (postpartum) in high-risk pregnancies. **Approved.**

A-3017—Allows nursing homes to expand their capacity within a five-year period by no more than ten beds or 10 percent without obtaining a certificate of need. **Approved.**

S-1979—Eliminates the requirement that the prescriber's address and registry number be included on the prescription label. **Active Support.**

A-3434—Amends the Insurance Fraud and Prevention Act to eliminate the verification of medical bills submitted with insurance claims. **Active Support.**

AJR-49—Directs the Commissioner of Health to study and report the feasibility of health enterprise zones. **Active Support.**

S-977—Authorizes the State Board of Higher Education to contract with an out-of-state medical school to accept two to four minority students per class. Following licensure, the students must serve three years in a medically underserved area of New Jersey. **Disapproved.**

S-1696—Requires the Department of Health to make available to physicians a pamphlet on the adverse effects and benefits of pertussis vaccination. The physician is to maintain appropriate documentation as to vaccination and consent. Major adverse reactions are to be reported to the manufacturer. **Disapproved.**

S-2372—Establishes local health planning to replace the HSA system. Funds are raised by taxing hospitals on patient volume. **Disapproved.**

S-2484—Provides for a legal services plan to assist Medicare beneficiaries in appealing denials of benefits. **Disapproved.**

S-600—Requires every physician attending a woman at the time of delivery, miscarriage, abortion, or during the prenatal period to perform an Rh test. If the test is Rh negative the physician shall, within 24 hours of receipt of the results, advise the woman of its significance and the availability of preventive treatment. **Active Opposition.**

S-1181—Requires hospitals to adopt policies and procedures which ensure newborns receive nourishment and care consistent with accepted medical standards. **Active Opposition.**

S-2703—Modifies the application of joint and several liability in tort actions. (In favor of MSNJ's **Active Support** of A-2401.) **Active Opposition.**

The following is a list of bills of the 1986-87 Legislature that were introduced after the meeting of the 1987 House of Delegates.

SENATE

S-1276-Contillo—Tobacco Sales to Minors. Prohibits the sale of tobacco and tobacco products to minors. **Approved.**

S-2137-McManimon—Health Planning. Creates a "local health planning" system to operate the certificate of need apparatus. The agencies would be funded by a special tax on hospitals. **Active Opposition,** MSNJ is opposed to governmental mandated health planning.

S-2387-DiFrancesco—Temporary Disability. Protects pregnant workers and others by providing mandatory job guarantees and health benefits for up to 26 weeks in a given year. **No Action.**

S-2392-DiFrancesco—Temporary Disability. Provides that parents of newly born, adopted, or seriously ill children will be entitled to leave from employment and guarantees employment security. Protected leave would be 26 weeks in a 24-month period. **No Action.**

S-2424-Codey—Pharmacy (same as A-2559). Prohibits certain health care institutions from conducting a retail pharmacy. **Active Opposition,** in accordance with Board of Trustees' actions (4-12-87). This bill is anticonsumer and detrimental to the future efforts of hospitals and physicians to diversify services in order to meet cost containment goals.

S-2960-Ewing—AIDS. Requires persons suspected of venereal disease to submit to HLTIV-III tests; requires applicants for marriage licenses to be tested and the physician to notify them in writing of the results on a form developed by the Department of Health; requires physicians to certify that they have tested applicants and notified them of the results. **Action Deferred,** pending further information from MSNJ's AIDS/HIV Task Force.

S-3009-Dalton—Emergency 911. Provides for planning and implementation of a 911 system throughout the state. **Conditional Approval,** pending amendment to the bill that would transfer the financing mechanism from community business phone users to the state government.

S-3013-McNamara—Medicaid. Expands the medically needy program to cover inpatient care. **Approved.**

S-3019-Pallone—Ocean Environment. Calls for the Department of Health and the Department of Environmental Protection to undertake a health impact study on New Jersey coastal waters. Appropriates \$1 million for the study. **Approved.**

S-3164-Lesniak—Medical Licensure. Deletes the requirement that physicians attend at least two years of college. **Disapproved,** because the existing statute that applies to educational requirements in New Jersey should not be weakened.

S-3170-Dorsey—Political Contributions (same as A-4374). Limits PAC contributions to \$2,500 per candidate per calendar year. **No Action.**

S-3177-Rand—Prescription Drugs. Prohibits mail order prescription drugs in state employee programs. **Conditional Approval,** pending amendment to the bill that would prohibit mail order drug dispensing unless they comply with all New Jersey drug dispensing regulations.

S-3233-Ewing—AIDS. Requires inmates in correctional institutions to be tested for AIDS. **Action Deferred,** pending further information from the AIDS/HIV Task Force.

S-3256-Cardinale—Healthy Lifestyles. Requires health insurers to give financial incentives for healthy lifestyles under insurance contracts and to offer wellness plans approved by the Commissioner of Insurance and Commissioner of Health. **Conditional Approval,** pending amendment to include periodic health care examinations.

S-3284-Zimmer—Emergency Medical Technicians. Permits emergency medical technicians certified by the Commissioner of Health as an EMT-D to perform cardiac defibrillation. **Active Support.**

S-3288-Bassano—Audiologists. Deletes the requirement that audiologists and speech therapists must pass a national examination. **Action Deferred,** pending further information from the New Jersey Academy of Ophthalmology and Otolaryngology.

S-3302-Feldman—Surrogate Parenting. Establishes a commission to study surrogate parenting. **Conditional Approval,** pending inclusion of MSNJ-appointed physician on the Commission.

S-3320-McManimon—Nursing Supply. Creates a commission to study the nursing supply problem.

No medical representation is included. **Conditional Approval**, pending inclusion of physician on Commission.

S-3352-VanWagner—Civil Immunity. Grants civil immunity to counselors and psychotherapists for disclosing a patient's potential for violence in certain situations. **Conditional Approval**, pending inclusion of physician in psychotherapy section of bill.

S-3381-Zane—Auto Insurance. Provides for certain amendments to the no-fault law. Establishes a medical fee schedule that incorporates the fees of 90 percent of the practitioners within a given region. **No Action (Conditional Veto).**

S-3390-Rand—Southern New Jersey Children's Hospital. Designates Cooper Hospital as the "Southern New Jersey Children's Hospital" provided a majority of the acute care hospitals providing inpatient pediatric care in southern New Jersey agree to refer to Cooper. (This bill substituted by **A-4073**.) **Approved.**

S-3414-McManimon—AIDS. Requires that funeral directors be notified in writing if a patient had a communicable disease which requires that precautions be taken. **Conditional Approval**, pending amendment to assure confidentiality of information by the funeral director.

S-3429-Dalton—Medical Fee Schedule (Auto Insurance). Provides that the Commissioner of Insurance shall promulgate a fee schedule at the 90th percentile. The schedules are to be reviewed biannually. **No Action.**

S-3475-Ambrosio—Recovery of Burial Expenses. Provides that noneconomic damages in the wrongful death of a minor shall be limited to \$100,000. **Action Deferred**, pending further information from the Medical Inter-Insurance Exchange of New Jersey.

S-3482—AIDS. Requires the Department of Health to adopt rules to assure that hospitals accept their fair share of patients with AIDS or ARC. **No Action.**

S-3498-Cardinale—Osteoporosis (same as A-3707). Creates a 15-member Commission to study services to patients with osteoporosis. Five of the members shall be health care professionals. **No Action.**

S-3500-McManimon—Disability Determinations (same as A-4465). Allows psychologists to certify disability. **Active Opposition**, the determination of disability certification is a medical decision.

S-3510-Dalton—Emergency Medical Services. Extends the Emergency Medical Services Study Commission another four months. The Commission in its first phase report has recommended a statewide 911 system. **Approved.**

S-3518-Haines—HMO. Provides that if an HMO and a contracting health care facility do not renew their contract, it shall remain in force four months following the contract expiration date in order to allow enrollees the opportunity for normal transition. **Conditional Approval**, pending an amendment to provide that the same notification be forwarded to providers as well as enrollees.

S-3633-Lipman—"Wellness". Requires health insurers to offer wellness incentives. **No Action.**

S-3651-DiFrancesco—Involuntary Commitments. Assures patients in short-term psychiatric facilities and screening services certain civil rights. **Action Deferred**, pending further information from MSNJ's Council on Mental Health.

S-3682-Gormley—Medical Waste Disposal. Imposes strict liability on hospitals and health care facilities for the damages caused by the discharge of waste into the ocean or fresh waters of the state. **Action Deferred**, pending further information from MSNJ's Council on Public Health and the Medical Inter-Insurance Exchange of New Jersey concerning the joint and several liability referred to in the bill statement.

S-3696-McManimon—Local Health Planning. Appropriates \$650,000 to fund local health planning. **Active Opposition**, mandated planning has not proved effective and should not be continued. Eleven states plus the federal government have deleted it.

ASSEMBLY

A-2559-Felice—Pharmacy (same as S-2424). Prohibits institutions from operating retail pharmacies within 1,500 feet of their facility. **Active Opposition**, in accordance with Board of Trustees' actions (4-12-87). This bill is anticonsumer and detrimental to the future efforts of hospitals and physicians to diversify services in order to meet cost-containment goals. **Conditional Veto.**

S-2682-Stuhltrager—Minors. Prohibits the sale of tobacco to minors. **Approved.**

A-3079-Paterniti—Temporary Disability. Provides that jobs of persons on temporary disability must be protected for 26 weeks. **Disapproved**, this bill would have a significant adverse impact on small businesses.

A-3081-Catrillo—Temporary Leave. Provides that positions of parents of seriously ill children may take protected leave of up to 26 weeks within a two-year period. **No Action.**

A-3683-Martin—Nursing Education. Directs Rutgers to establish a doctoral program in nursing. **Disapproved**, the trustees of the University should determine what degrees should be offered.

A-3707-Paterniti—Osteoporosis (same as S-3498). Establishes a commission (15 members) to compile and analyze data on osteoporosis, develop educational programs, and assist local health agencies in public education. **No Action.**

A-3711-Zecker—No Fault. Amends the no-fault law in several areas. Requires carriers to conduct utilization review and to engage in managed care. **Disapproved**, third-party carriers are denying patients access to needed care. This legislation would aggravate that situation.

A-3719-Cooper—Withholding or Withdrawing Treatment in Terminal Illness. Allows competent adults to issue a directive that provides they shall not be artificially sustained during a terminal condition.

No definition is provided for terminal condition. **Action Deferred**, pending report of the Governor's Commission on Biomedical Ethics.

A-3724-Catrillo—AIDS. Requires the Department of Health to institute a mobile educational program on AIDS for IV drug users. **Action Deferred**, pending further information from MSNJ's HIV/AIDS Task Force.

A-3725-Singer—Child Abuse. Establishes a child abuse diagnostic center in southern New Jersey. **Approved.**

A-3744-Ogden—Communicable Disease. Requires health care facilities to notify first aid, ambulance, or rescue squads that the patient they are transporting has a communicable disease when that fact is known to the facility. **Approved.**

A-3751-Loveys—Structured Payments in Tort (same as A-4615). Requires structured payments when future damages exceed \$200,000 by means of an annuity contract. **Active Support.**

A-3754-Doyle—Emergency Services. Requires volunteer emergency personnel to be certified either through the State First Aid Council or the Department of Health. **Approved.**

A-3777-Colburn—Certificate of Need (CON). Allows hospitals to undertake outpatient projects costing no more than \$2,000,000 without obtaining a certificate of need. **Active Support.**

A-3801-Kline—AIDS (Health Insurance). Prohibits the denial of insurance to persons with AIDS. **Action Deferred**, pending further information from MSNJ's HIV/AIDS Task Force.

A-3817-Kline—AIDS (Funeral Directors). Requires doctors, nurses, or the medical examiner to notify the funeral director in writing if the decedent had or was suspected of suffering from a communicable disease. **Conditional Approval**, pending amendment to assure confidentiality of information by the funeral director. Refer to MSNJ's HIV/AIDS Task Force. **(Absolute Veto.)**

A-3865-Kosco—Prosthetists and Orthotists. Licenses and regulates prosthetists and orthotists through a multidisciplinary professional board with the Division of Professional Boards. **Disapproved**, there is no indication that public interest will be served by licensing these technicians.

A-3882-Moran—Prescription Drugs (same as S-3177). Prohibits mail order prescription drugs in any state benefits program for public employees. **Conditional Approval**, pending amendment to the bill that would prohibit mail order drug dispensing unless they comply with all New Jersey drug dispensing regulations.

A-3933-Felice—Medicaid. Increases fees for professional health services to Medicaid recipients by 10 percent. **Conditional Approval**, Medicaid fees are an embarrassment and should be raised to the level of Medicare.

A-3935-Singer—Medicare. Requires the Commissioner of Health to study the senior medical courtesy program and to file a report by January 1, 1988. **No Action.**

A-3948-Kline—AIDS Reporting. Requires that patients with positive HTLV III be reported to the Department of Health within 72 hours. The Department shall institute contact tracing. All information is to be confidential. **Action Deferred**, pending further information from MSNJ's HIV/AIDS Task Force.

A-3965-Pelly—Impaired Professionals. Directs the Boards responsible for licensing certain but not all health professionals to institute impaired professional programs. Professional societies would contract with the respective boards to administer the program. There are no details regarding qualifications of personnel or funding. **No Action.**

A-3995-Gargiulo—Suicide (Elderly). Creates a 13-member commission to study the problem of suicide among the elderly. **Disapproved**, there are other sectors of our society that have a suicide rate higher than the elderly—to be meaningful, the study should include all ages.

A-4001-Collins—Nurses Supply (same as S-3320). Creates a commission to study the nursing supply problem. Does not include physician representation. **Conditional Approval**, pending inclusion of physician on Commission. **(Absolute Veto.)**

A-4013-Otowski—Mental Health. Assures persons receiving treatment on an involuntary basis in either a screening service of short-term facility of the same rights as patients who have been involuntarily committed to state or county psychiatric facilities. **Action Deferred**, pending further information from MSNJ's Council on Mental Health.

A-4043-Albohn—Audiologists. Deletes the requirement that audiologists and speech pathologists must pass a national examination. **Action Deferred**, pending further information from the New Jersey Academy of Ophthalmology and Otolaryngology.

A-4069-Kern—AIDS. Provides that anyone with AIDS who knows of their infection and commits an act of sexual penetration is guilty of a crime of the third degree. **Action Deferred**, pending further information from MSNJ's HIV/AIDS Task Force.

A-4073-Bryant—Southern New Jersey Children's Hospital (same as S-3390). Designates Cooper Hospital as the "southern New Jersey children's hospital" provided a majority of the acute care hospitals providing inpatient pediatric care in southern New Jersey agree to refer to Cooper. **(LAW c.299 (1987))**

A-4119-Zecker—County Medical Examiners. Requires the state to finance the county medical examiner system. **No Action.**

A-4138-Kavanaugh—Surrogate Parenting. Prohibits the payment of money for surrogate parenting purposes. **No Action.**

A-4161—Kavanaugh—Alcoholism and Drug Abuse. Creates a Governor's Council on Alcoholism and Drug Abuse. The Council will be the single state agency for alcohol and drug abuse; coordinates all state educational programs; develop and implement a master plan for treatment, prevention, research, and education. The Council will be in but not "of" the Department of Health. **Action Deferred**, pending further

information from MSNJ's Committee on Drug and Alcohol Abuse. Refer to MSNJ's HIV/AIDS Task Force.

A-4171-Kern—Council on Alcoholism and Drug Abuse. Similar to but not identical to A-4161. Does not reorganize the current agencies in state government as does A-4161. **Action Deferred**, pending further information from MSNJ's Committee on Drug and Alcohol Abuse. Refer to MSNJ's HIV/AIDS Task Force.

A-4182-Deverin—Medicaid. Extends Medicaid benefits for one year for employed patients after they have left Aid to Families with Dependent Children (AFDC) eligibility. (**LAW c.283 (1987)**)

A-4249-Villane—Environment. Requires the state government to study the health effects of chlorinated sewage in coastal waters. **Approved.**

A-4316-Randall—Adolescent Drug and Alcohol Abuse. Requires the Commissioner of Health to establish a 15-member task force to study and make recommendations regarding regulations for drug and alcohol treatment programs for adolescents. **Action Deferred**, pending further information from MSNJ's Committee on Drug and Alcohol Abuse.

A-4334-Colburn—HMO Contracts with Health Care Facilities. Provides that in the event that an HMO and a general hospital or other health care facility with which the HMO has a contract to provide services to its enrollees, are unable to agree on the terms of a new contract upon the expiration of the current contract, the health care facility and the HMO shall continue to abide by the terms of that contract for a period of four months from the date of expiration of the contract, during which time an enrollee of that HMO who has been receiving services from the health care facility under the terms of the previously existing contract may terminate his enrollment in the HMO and purchase health care benefits from another provider or insurance carrier. **Conditional Approval**, pending an amendment to provide that the same notification be forwarded to providers as well as enrollees.

A-4361-Kline—AIDS. Makes it a crime of the fourth degree for state employees to make an unauthorized disclosure of AIDS reports which have been submitted to the Department of Health. **Action Deferred**, pending further information on current statute concerning unauthorized disclosures.

A-4374-Donovan—Political Contributions (same as S-3170). Limits PAC contributions to \$2,500 per candidate per calendar year. **No Action.**

A-4432-Zecker—Civil Immunity. Permits certain nonprofit corporations to extend immunity to trustees, directors, officers, members, or employees when exercising judgment or discretion. **Approved.**

A-4435-Palaia—Emergency Medical Services (EMS). Appropriates \$1,500,000 to fund a statewide EMS network. **Approved.**

A-4465-Penn—Psychologists. Permits psychologists to certify disability under the temporary disability benefits law. **Active Opposition**, the determination of disability certification is a medical decision.

A-4466-Loveys—Joint and Several Liability. Eliminates joint and several liability except for environmental torts. **Active Support.**

A-4484-Rafferty—Collateral Sources of Income. Requires that collateral sources other than workers' compensation or life insurance shall be offset in personal injury actions. **No Action.**

A-4497-Villane—Medical Waste. Amends the hazardous waste act to include medical waste. **Action Deferred**, pending further information from MSNJ's Council on Public Health.

A-4515-Kern—Health Planning. Appropriates \$650,000 to fund local health planning. **Active Opposition**, mandated planning has not proved effective and should not be continued. Eleven states plus the federal government have deleted it.

A-4551-Deverin—Medicaid Fiscal Intermediaries. Provides that health service corporations and dental service corporations can qualify as intermediaries under Medicaid. **Approved.**

A-4615-Loveys—Structured Payments (same as A-3751). Provides for structured payments of future damages exceeding \$200,000. **Active Support.**

AR-141-Singer—Senior Medical Courtesy Program. Commends the Union and Ocean County Medical Societies for their senior medical courtesy programs. **Active Support.**

AR-143-Farragher—Medicare Fees. Requests Congress to raise fees to doctors participating in Medicare. **Active Support.**

AR-156-Kalik—Medicare—Catastrophic Illness. Requests Congress to provide Medicare recipients with catastrophic illness coverage. **Active Support.**

At the close of the 1986-87 Legislative Year all of the bills expired except those signed into law, vetoed, or filed by the Governor.

1987 HOUSE OF DELEGATES

Resolution #8—Physician Representation on Governmental Committees

Resolved, that the Medical Society of New Jersey continue to seek ways and means to have physicians placed on any governmental committee having to do with health problems and policies in the state of New Jersey.

Council on Legislation notes that recommendations of physicians being placed on governmental committees has already been implemented by MSNJ.

Resolution #12—First Aid Station in New Jersey Legislature

Resolved, that the Medical Society of New Jersey investigate the feasibility of offering, to both houses of the New Jersey Legislature, a rotational volunteer staffing of a first aid station for legislators.

The Council on Legislation appointed a representative from the New Jersey Chapter of the American College of Emergency Physicians, along with MSNJ's lobbyist to investigate and report back the feasibility of a first aid station in the New Jersey Legislature.

Resolution #29E—Physician Supervised Physical Therapy

Resolved, that the Council on Legislation of the Medical Society of New Jersey draft and seek to have introduced legislation that requires that physical therapy services may be rendered only under physician supervision.

The Council on Legislation accepted the foregoing information and noted that MSNJ is in the process of developing the appropriate language.

FEDERAL LEGISLATION

Summary of Medicare Reconciliation Provisions Relating to Payment for Physicians' Services Three-Month Freeze: During the three-month period ending March 31, 1988, prevailing and customary charge levels will be maintained at the levels in effect during 1987. Maximum Allowable Actual Charges (MAACs) for individual physicians' services furnished by nonparticipating physicians during the three-month period ending on March 31, 1988, will be the amount determined for 1987. (1988 MAACs will go into effect on April 1, 1988)

Physician Participation Agreements: Physicians who were participating physicians in 1987 will be entitled to terminate their 1987 agreement if they request to do so prior to December 31, 1987. Otherwise, all agreements in effect on December 31, 1987, will remain in effect for the three-month period ending on March 31, 1988. The effective period for participation agreements entered into for 1988 will be the nine-month period beginning on April 1, 1988, through December 31, 1988.

The Reference Committee noted that a vote of thanks was extended to the chairman, Doctor Irving P. Ratner, and members of the Council on Legislation, and to Mrs. June O'Hare, staff liaison to the Council, for the yeoman's work they are doing.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Supplemental Report #1

Council on Legislation

IRVING P. RATNER, MD, CHAIRMAN
(Reference Committee "D")

At 12 o'clock noon, Tuesday, January 12, 1988, the Senate and General Assembly met for organization of the First Annual Session of the 203rd New Jersey State Legislature. As the Legislature presently is constituted, the Senate has a total of 40 members consisting of 16 Republicans and 24 Democrats. The Assembly has a total of 80 members consisting of 42 Republicans and 38 Democrats. By means of official legislative bulletins, the Society's official legislative positions on all current state legislation regularly are called to the attention of legislators as well as component societies, cooperating agencies, county keymen, county society executive directors, and executive secretaries.

The Society has adopted the following regular range of official positions concerning proposed legislation:

- | | |
|-----------------------------------|--|
| Watch List | For all approved/disapproved legislation. |
| Active Support | All-out support for the measure. |
| Active Opposition | All-out opposition for the measure. |
| Note and File | For all no action legislation. |
| Conditional Approval | To indicate that the approval of the Society is conditional, subject to elimination of the unsatisfactory elements of the bill that are pointed out. |
| Action Deferred | Pending amendment that will have substantial impact on active support/active opposition legislation. |

Current Legislation

The Council offers this Supplemental Report #1 covering items dealt with since the compilation of its Annual Report.

Senate

S-6-Rand—Burn Registry and Reporting. Requires physicians treating a person with burns over 5 percent of his body to report the same to state or local police. Establishes a central burn registry in the Department of Community Affairs. **No Action.**

S-12-Rand—Banking and Insurance. Merges the Departments of Banking and Insurance into a single department with one commissioner. **No Action.**

S-48-Paterniti—Huntington's Disease. Establishes a Huntington's disease demonstration project within the Department of Health. The commissioner is to contract with a long-term care facility to operate a special 10 to 15 bed unit to measure the effectiveness of a special care program. **No Action.**

S-57-Paterniti—Professional Liability. Allows organizations of professionals to form associations to self-insure professional liability. The entities created would be under special regulatory control of the Insurance Department, but are not to be considered insurance companies. **Disapproved,** because the program would not protect the public by assuring adequate financing.

S-69-VanWagner—Wrongful Death. Expands recoverable damages in wrongful death actions to include emotional and social factors along with mental anguish. **Disapproved,** Supreme Court decisions in New Jersey have established a reasonable and workable format awarding damages in wrongful death actions. This bill would create an unwarranted expansion and escalate the cost of liability insurance without benefit to the public.

S-91-VanWagner—Home Health Care. This bill establishes an 18-month home health and community care demonstration program in the Department of Human Services. This program is designed to provide for the delivery of community-based home health care services by local home health and community care demonstration centers to functionally impaired persons who are at least 65 years of age or older or who are disabled pursuant to the Social Security Act.

This bill appropriates \$7,500,000 from the Casino Revenue Fund to the Department of Human Services and requires that of this sum, at least \$6,900,000 shall be allocated for funding to the Home Health and Community Care Demonstration Centers. **Approved.**

S-154-Lesniak—Medical Licensing Requirements. Deletes the requirement that physicians attend at least two years of college. **Disapproved,** because the existing statute that applies to educational requirements in New Jersey should not be weakened.

S-164-Zimmer—Emergency Medical Services. Creates an intermediate emergency unit which would allow an EMT-intermediate technician to provide advanced life support. **Disapproved,** in favor of MSNJ approval of S-190.

S-190-Zimmer—Emergency Medical Services. This bill permits an emergency medical technician (EMT) who has been certified by the commissioner of health to perform cardiac defibrillation, according to rules and regulations adopted by the commissioner. **Approved.**

S-213-O'Connor—Automobile Insurance. Assures that auto insurers cannot issue a policy with a medical deductible unless evidence of underlying medical insurance is provided. **Approved.**

S-216-O'Connor—Board of Chiropractic Examiners. Creates a separate licensing and regulatory board for chiropractic. **Active Opposition,** because there is no demonstrative need for this legislation. Chiropractics are adequately supervised under the auspices of the New Jersey SBME.

S-219-O'Connor—Nutritionists. Provides for the licensing and regulation of nutritionists through a Board of Nutrition within the Department of Law and Public Safety. **Active Opposition,** MSNJ generically is opposed to the creation of new professional boards.

S-263-Dumont—Statute of Limitations. Provides for a three-year statute of limitations, except for fraud, intentional concealment, or nontherapeutic or diagnostic purpose. Minors would have until age 11 on any injury prior to age 8. **Active Support.**

S-287-Dumont—Drug Abuse. Creates a commission to study the efficacy of mandating health insurance coverage of drug abuse treatment. **No Action.**

S-301-Dumont—Physical Therapy. Requires physical therapy treatment to be given under the supervision of a practitioner authorized to prescribe treatment. "Supervision" is defined as personally monitoring the progress of treatment and includes intermittent observation of treatment sessions. **Action Deferred,** pending further information from the New Jersey Academy of Family Practice, New Jersey Orthopaedic Society, and the New Jersey Society of Physical Medicine and Rehabilitation.

S-323-Costa—Nursing Homes. Requires skilled nursing homes or intermediate care facilities to have at least one registered nurse on duty 24 hours a day. **Disapproved,** current statute concerning nursing homes is adequate.

S-382-Lynch—Contact Lenses. Creates the profession of contact lens dispensing and fitting for nonphysicians and nonoptometrists. Licensure and regulation would be through the Board of Examiners of Ophthalmic Dispensers and Ophthalmic Technicians. A prescription by a licensed optometrist or physician would be required. **Disapproved,** to that portion of the bill referring to the fitting of contact lenses because the public will unnecessarily be exposed to the risk of corneal abrasions and other types of eye injuries.

S-425-Haines—Insanity. Abolishes insanity as a defense for criminal conduct. Insanity would become a factor to consider for sentencing purposes. **No Action.**

S-442-Haines—HMOs. Provides that if an HMO and a contracting health care facility do not renew their contract, it shall remain in force for four months following the contract expiration date in order to allow enrollees the opportunity for normal transition. **Conditional Approval**, pending an amendment to provide that the same notification be forwarded to physicians as well as patients.

S-448-Bubba—Patient Rights. Would establish a bill of rights for hospital patients. The rights enumerated are essentially the developed common-law rights of patients in this state. The hospital administrator must supply written notice of these rights to all patients and post the notice in a conspicuous place in the facility. **Conditional Approval**, pending deletion of the litigation option of the bill, since it will produce unnecessary delays and cost patients extra legal expense. Further, there should be a clause or section added to the bill recognizing that patients have certain obligations to cooperate in their treatment and to comply with advice and directions.

S-470-Bubba—Surgical Consent. Requires physicians to personally present and obtain surgical consent forms and signatures. The form shall state the name of any assisting physician that performs surgery under the supervision of the attending. **Active Opposition**, this procedure relates to physician/patient relationship. It should not be a matter of licensure law. It is well addressed in civil and regulatory law.

S-490-Bubba—Surgical Consent. Requires express written consent to surgery except in cases of physical or mental incapacity or emergencies. The State Board, after consultation with the Health Department, the Medical Society, and the Hospital Association shall prescribe the consent forms which shall be used by physicians. **Conditional Approval**, pending further clarification of the bill from the sponsor, amendment inserting "operative" procedure in place of "surgical" procedure, and further information regarding the bill from the New Jersey Chapter, American College of Surgeons as to what impact this legislation would have on them.

S-545-Brown—Conflict of Interest. Prohibits participation by legislators in passage of legislation in which they have a personal interest. **No Action.**

S-550-Brown—Ombudsman for Children. Creates an office of ombudsman to monitor services rendered to children through the Department of Human Services. **Action Deferred**, pending further information from the New Jersey Academy of Pediatrics.

S-554-Brown—DYFS Study Commission. Establishes a 15-member commission to study and report on the operation of the Division of Youth and Family Services. **Conditional Approval**, pending the inclusion of a physician on the Commission.

S-634-Cowan—Licensing Board Immunity. Expands immunity from antitrust suits to licensing boards to include their actions regarding admittance to a profession, suspension, and revocation of licenses. **Approved.**

S-687-Laskin—Criminal Responsibility. Would abolish the defense of insanity, but would allow evidence of mental condition to be considered at time of sentencing. **No Action.**

S-692-Laskin—Repeals No-Fault Law. Repeals no-fault—reinstates the financial responsibility law and makes PIP (personal injury protection) optional. **Action Deferred**, pending further information from MSNJ's Council on Medical Services.

S-718-Codey—Certificate of Need. Amends the certificate of need to include physicians whenever a health service has been regionalized by regulation of the Department of Health. Regulation would terminate within three years, at which time, the commissioner could readopt the regulation. **Active Opposition**, there is no evidence the certificate of need concept is a valid regulatory item. It has proved to be ineffective in containing costs, it has stifled initiative, its expansion to intrude on the private practice of medicine is not warranted. Nationally, at least 11 states have repealed certificate of need legislation and a number of federal agencies (including the Department of Health and Human Services and the Federal Trade Commission) have called for its repeal.

S-722-Codey—Mental Health Coverage. Requires health insurers to provide coverage for mental illnesses. **Approved.**

S-723-Codey—Mental Health Coverage. Requires health insurers to provide coverage for mental illnesses. **Approved.**

S-724-Codey—Mental Health Coverage. Requires health insurers to provide coverage for mental illnesses. **Approved.**

S-725-Codey—Mental Health Coverage. Requires health insurers to provide coverage for mental illnesses. **Approved.**

S-726-Codey—Mental Health Coverage. Requires health insurers to provide coverage for mental illnesses. **Approved.**

S-727-Codey—Mental Health Coverage. Requires health insurers to provide coverage for mental illnesses. **Approved.**

S-731-Codey—Child Abuse. Changes the penalty for failure to report child abuse to a crime of the fourth degree. **Disapproved**, there is no evidence that a change in penalty is necessary. It would be better to extend DYFS counseling and hotline coverage and referral.

S-734-Codey—Financial Disclosure. Prohibits physician from referring patients for services in which the physician or his immediate family holds a significant ownership interest unless the patient is advised, in writing, and given the option of a prescription. **Conditional Approval**, pending disclosure is expanded to all providers.

S-738-Codey—Peer Review. Clarifies immunity regarding peer review, expands the committees to

which it applies, and extends immunity to people providing information to such committees in good faith. **Approved.**

S-768-McManimon—Acupuncture. Provides that acupuncturists are eligible for reimbursement under Blue Shield contracts if the service is otherwise covered. **No Action.**

S-784-McManimon—Disability Determinations. Allows psychologists to certify disability. **Active Opposition,** the determination of disability certification is a medical decision.

S-801-Costa—Blood Alcohol Level. Provides that the blood alcohol concentration level of commercial drivers may not exceed .0399. **Approved.**

S-823-Graves—Orthotists and Prosthetists. Provides for the regulation and licensure of orthotists and prosthetists by a separate board which would be under the overall direction of the director of consumer affairs. Orthotic devices must be prescribed by a physician, dentist, or podiatrist. Prosthetic devices must be prescribed by a licensed physician. **Disapproved,** because MSNJ is opposed to the creation of new professional boards unless there is evidence of a need to regulate and license a new profession.

S-906-Hurley—Withholding or Withdrawing of Services in the Event of Terminal Illness. Empowers adults to execute a statutory form of directive to their physicians providing for the withholding or withdrawing of life-sustaining procedures during a terminal illness. The directive would be valid for five years and provides immunity for physicians and other providers complying with such a directive. "Life sustaining" means a modality or intervention which utilizes mechanical or other artificial means to sustain, restore, or supplant a vital function which would serve only artificially to prolong the moment of death where in the judgment of the attending physician death is imminent whether or not such procedures are utilized. It does not include "the administration of medication or the performance of any medical procedure deemed necessary to alleviate pain." **Action Deferred,** pending further information from MSNJ's Committee on Biomedical Ethics.

S-933-Hurley—Motor Vehicles. Extends implied consent to the taking of blood and urine testing to determine if a driver is "under the influence." Penalties for refusal by repeat violators correspond to penalties for repeat drunken driving. **Approved.**

S-938-Hurley—First Aid Districts. Provides that municipalities can adopt ordinances designating first aid districts. Each of the districts will become separate corporate bodies. All squads within the district are to be under the general supervision of the district authority. **Action Deferred,** pending further information from MSNJ's Committee on Emergency Medical Care.

S-944-Hurley—Hospice Care. Makes hospice care a mandated coverage item under health insurance coverages issued by carriers in New Jersey. **Approved.**

S-1014-Lipman—Medical Residents. Provides that participants in approved graduate education programs will be issued a temporary license not to exceed a six-year period. Approved programs are defined as those accredited by the Accreditation Council for Graduate Medical Education. **Approved.**

S-1018-Lipman—Nursing Practice. Authorizes nurses to practice medicine and to prescribe drugs and devices. **Active Opposition,** nurses are not qualified to make a medical diagnosis nor to prescribe therapeutic medications.

S-1040-Lipman—Health Education. Requires the Department of Education to provide health and wellness programs which are to be incorporated into the curriculum of each school district for grades K-12. **No Action.**

S-1041-Lipman—Health Wellness Insurance Incentives. Requires health insurers to offer wellness incentives. **No Action.**

S-1062-DiFrancesco—Abuse of Elderly, Disabled or Incapacitated Persons. Requires every person who has reasonable cause to believe an elderly or disabled person is the victim of abuse or exploitation to report that information to the commissioner of human services or his designee. **Active Support** (pending further clarification of the bill to existing statute).

S-1114-Cardinale—Monosodium Glutamate. Requires restaurants to notify customers if they use monosodium glutamate in preparation of their food or add it to the food after preparation. Notice would be, in writing, on or attached to the menu. **Approved.**

S-1123-Cardinale—Certificate of Need. Exempts the private practice of medicine from the certificate of need law. **Active Support.**

S-1134-Cardinale—Radiation Protection Commission. Adds two members expert in medical physics and epidemiology to the Radiation Protection Commission. **Approved.**

S-1145-Cardinale—Marriage License Certificate. Requires applicants to be tested for thalassemia, sickle cell anemia, and Tay-Sachs. The physician must notify the applicants of the test results in writing. **Disapproved,** because two far more universal diseases—diabetes and rubella—are not included in the testing and those listed have a limited population susceptibility. The tests themselves would not be medically indicated for a majority of applicants.

S-1146-Cardinale—Noneconomic Damages in Tort. Limits noneconomic damage awards to \$100,000. **Active Support.**

S-1150-Cardinale—Noneconomic Damages in Tort. Places a \$350,000 cap on awards for pain and suffering. The limit shall be revised annually by the Consumer Price Index—U.S.—City Average. **Approved.**

S-1153-Cardinale—Alcoholic Beverages. Requires that alcoholic beverages be labeled to advise of potential harm to fetus when consumed by pregnant women. **Active Support.**

S-1158-Cardinale—Health Lifestyles. Requires health insurers to give financial incentives for health lifestyles under insurance contracts and to offer wellness plans approved by the Commissioner of Insurance and Commissioner of Health. **Conditional Approval,** pending amendment to include periodic health care

examinations.

S-1163-Cardinale—Osteoporosis Study Commission. Creates a 15-member commission to study services to patients with osteoporosis. Five of the members shall be health care professionals. **Disapproved**, osteoporosis is a well-known, researched, and publicized condition—there is no need to create a special legislative commission to conduct studies when comprehensive scientific literature is readily available.

S-1177-Feldman—Privileged Communications. Extends privileged communications to psychiatric social workers and nurses. Also, by implication, it advances the concept that persons other than physicians and psychologists may treat mental health conditions. **Action Deferred**, pending further information from the New Jersey Psychiatric Association.

S-1178-Feldman—Confidentiality of Medical Claims Information. Provides that employers could not review medical claims submitted by employees on claims through the employers' coverage. It assumes that employers discourage claims in order to contain premiums. Applied to Blue Cross. **Approved.**

S-1179-Feldman—Medical Claims Information. Same as S-1178 except it applies to group health insurance. **Approved.**

S-1180-Feldman—Medical Claims Information. Same as S-1178 except it applies to Blue Shield. **Approved.**

S-1188-Feldman—Medical Malpractice. Provides that within 60 days of filing an action against a physician the plaintiff must provide an affidavit from an expert that there has been a negligent deviation from the accepted standards of practice. **Active Support.**

S-1190-Feldman—F frivolous Suits. Authorizes courts to award reasonable attorney fees to a party who has been subjected to a frivolous claim. **Active Support.**

S-1194-Feldman—Withholding or Withdrawing Life Support. Provides that persons 18 years of age or older can execute a directive regarding life-sustaining measures when that person is no longer able to express their own consent and their condition is terminal. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

S-1205-Feldman—Administrative Law. Makes the decision of an administrative law judge final in contested agency actions. **Active Support.**

S-1208-Feldman—Social Work. This bill would establish and license two categories of social workers and would create a Board of Social Work Examiners in the Department of Law and Public Safety whose powers and duties, among others, would be to administer the act, examine, and license candidates for the various categories of social work and promulgate rules and regulations necessary for the effective enforcement of the act.

The two categories of licensed social work would be (1) social work specialists, who would be required to have a doctorate in social work or a master's degree from an accredited school of social work and (2) social workers who would need a baccalaureate degree from an accredited college or university social work or social welfare program.

The bill would "grandfather" in all persons currently in practice, provided they have been in practice in one of the two licensed categories for two of the last five years and apply to be licensed within 180 days from the effective date of this act. **Active Opposition**, because there has been no demonstrative need for licensure of this occupation as a separate and independent profession.

S-1226-Feldman—Malpractice Study. Requires the State Board of Medical Examiners to analyze the data that has been reported to it regarding malpractice and to make findings and recommendations to the legislature. **Approved.**

S-1242-Feldman—Surrogate Parenting. Establishes a commission to study surrogate parenting. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

S-1249-Feldman—Cardiopulmonary Resuscitation (CPR). Requires each local board of education to provide instruction in CPR to all secondary pupils. **No Action.**

S-1252-Contillo—National Health Care. Provides for a nonbinding referendum concerning the enactment of a national health plan. **Active Opposition**, the bill presents a utopian approach and does not consider the negative impact of cost and quality factors. It is misrepresentation in the purest form.

S-1270-Ambrosio—Wrongful Death. Provides for noneconomic damages in wrongful death actions where the decedent was a minor. Those damages are limited to \$100,000. **Disapproved**, this would unwarrantedly increase the cost of all liability insurance in New Jersey.

S-1281-Connors—Administrative Law. Creates a legislative commission to review the rules being effected by state agencies. The commission could not prevent a rule from going into effect. It could recommend corrective action. **No Action.**

S-1300-Connors—Disposal of Human Tissue. Provides that human tissue and fetal tissue shall be disposed of by incineration through a licensed facility approved by the Department of Health. **Approved.**

S-1350-Cowan—Council on Disability. Establishes a council on disabilities consisting of 50 persons. The Council is to function as the primary planning and advisory body in state government on the interests and needs of those with disabilities. A subcouncil on developmental disabilities with 20 members is created within the overall council. **No Action.**

S-1351-Rice—Biochemical Disorders. Requires the Department of Health to provide screening and treatment programs for newborns with biochemical disorders. **Action Deferred**, pending further information from New Jersey Academy of Pediatrics.

S-1446-Zane—Organ Transplants. Establishes a commission on transplants to allocate transplant services for New Jersey residents. Out-of-state programs are not recognized if the service is available at

a New Jersey hospital. **Action Deferred**, pending further information from the New Jersey Chapter of the American College of Surgeons.

S-1474-Zane—Handguns (same as A-594). Provides for the issuance of lifetime handgun purchaser cards. **Disapproved**, this bill unwarrantedly liberalizes current law and exposes the public to injury and death.

S-1481-McNamara—AIDS. Establishes an AIDS advisory council within the Department of Health. The council is to advise the commissioner on policy and priorities for preventing, detecting, and treating AIDS. **Approved.**

S-1491-Gagliano—Physician Assistants. Prohibits the licensing and/or practice of physician assistants. **Active Support.**

S-1516-Dalton—Medical Fee Schedule (No-Fault). Provides that the commissioner of insurance shall promulgate a fee schedule at the 90th percentile. The schedules are to be reviewed biannually. **Disapproved**, there is no evidence that physician services are a significant factor in PIP benefits and auto insurance. This bill will create a potential availability crisis.

S-1543-Pallone—School Health Services. Prohibits school health programs from providing services or counseling relating to pregnancy or abortion. **Conditional Approval**, pending amendment to allow educational and counseling service provisions.

S-1553-Pallone—Ocean Environment. Calls for the Department of Health and the Department of Environmental Protection to undertake a health impact study of chlorinated sewage on New Jersey coastal waters. Appropriates \$1 million for the study. **Approved.**

S-1554-Pallone—Artificial Tanning. Requires the Department of Health to establish safety standards for tanning facilities which shall be enforced through the local boards of health. **Disapproved**, since there is no safe level of ultraviolet rays. A bill banning these tanning parlors should be considered.

S-1612-Orechio—Drug Abuse Treatment. Requires health insurers and HMOs to include coverage for drug abuse treatment as for any other illness. **Approved.**

S-1613-Orechio—Drug Abuse Treatment. Same as S-1612. **Approved.**

S-1614-Orechio—Drug Abuse Treatment. Same as S-1612. **Approved.**

S-1615-Orechio—Drug Abuse Treatment. Same as S-1612. **Approved.**

S-1617-Orechio—Drug Abuse Treatment. Same as S-1612. **Approved.**

S-1649-Orechio—Medicare Assignment. Requires health care licensees to accept Medicare determination of their fees. **Active Opposition**, participation in any health plan is not a valid licensure criteria, there is no evidence that a draconian measure of this nature is necessary since over 70 percent of the physicians accept assignment in a given instance. The bill violates the New Jersey and U.S. Constitutions.

S-1685-Bassano—Mental Health Records. Requires institutions to make available mental health records upon request when the patient is an applicant for a police position or firearm permits. **Disapproved**, unnecessary legislation—this situation can be addressed by a release signed by the prospective employee or firearm purchasers.

S-1702-Bassano—AIDS. Makes AIDS a reportable disease. Grants immunity to physicians who deem it advisable to inform sexual partners of the patient's condition. **Action Deferred**, pending report of MSNJ AIDS Task Force.

S-1705-Bassano—Joint and Several Liability. Eliminates joint and several liability. **Active Support.**

S-1706-Bassano—Collateral Sources. Provides that benefits from collateral sources shall be deducted from awards in personal injury actions. **No Action.**

S-1711-Bassano—Emergency Medical Services. Provides that whenever an emergency ambulance vehicle is in service it must be staffed by at least one EMT. **Approved.**

S-1730-Bassano—Viral Disease Research. Establishes a viral disease research bank through cooperation between the Department of Health and the University of Medicine and Dentistry of New Jersey (UMDNJ). **Action Deferred**, pending further information from UMDNJ, the Department of Health, and the Coriell Institute of Camden.

S-1745-Dorsey—Immunization of School Children. Requires all children attending public or private day care centers, nursery schools, and kindergartens to receive HIB vaccinations. **Conditional Approval**, pending amendments confirming there are several HIB vaccines to administer.

S-1749-Dorsey—State Agencies. Creates a joint committee of the Legislature to effect an agency sunset law (i.e. the agency must justify its existence every five years). **No Action.**

S-1763-Dorsey—Renal Disease. Provides state financial support of private, nonprofit renal disease treatment programs. **Disapproved**, renal disease treatment programs are covered under federal programs.

S-1804-Dorsey—Irradiation of Foods. Requires food processors and public eating places to provide written notice regarding irradiated foods. **Approved.**

S-1816-Dorsey—Irradiation of Foods. Prohibits the distribution and sale of irradiated food. **Disapproved**, there is no scientific evidence that irradiation is harmful.

S-1821-Dorsey—Certificate of Need. Exempts FDA approval self-administered test kits from CON requirements. **Approved.**

S-1828-Dorsey—Campaign Contribution. Limits PACs to contributions of \$2,500 in state Assembly and Senate elections. **Disapproved**, limiting the amount which a PAC could contribute to a legislative candidate would disadvantage the individuals who pool their resources in a PAC.

S-1845-Lesniak—Structured Payments in Tort Actions. Provides for structured payments in civil

actions against health care providers when future damages exceed \$250,000. An annuity contract must be offered to guarantee the future payments. **Active Support.**

S-1891-Ewing—Alcohol and Drug Abuse Council. This bill merges the Division of Alcoholism and the Division of Narcotic and Drug Abuse Control within the Department of Health into a single division administered by a deputy commissioner of health. The division will carry out the over all policy and plans established by the Governor's Council on Alcoholism and Drug Abuse which will coordinate all programs within the state. **No Action.**

S-1938-Pallone—Medical Waste. Requires that all medical waste be incinerated by a licensed center. Manifest records must be maintained by the generators, i.e. doctors, dentists, hospitals, the transporters, and the incinerators. **Action Deferred,** pending further information from MSNJ's Committee on Environmental Health.

S-1963-Rice—HIV Antibody Testing. Requires that at the discretion of the court, persons convicted of prostitution may be required to submit to HIV-antibody testing. **Conditional Approval.**

S-1965-Paterniti—Nursing Home Preadmission Screening. Establishes a screening procedure to prevent inappropriate nursing home admissions. **No Action.**

S-1971-Russo—Repeals No-Fault Law. Repeals no-fault and makes PIP optional. **Action Deferred,** pending further information from MSNJ's Council on Medical Services and the New Jersey Orthopaedic Society.

S-1980-Lesniak—Immunity of Trustees of Nonprofit Corporations. Provides that volunteer trustees of nonprofit corporations may be immunized from paying damages to the corporation or its membership. **Approved.**

S-1984-McManimon—Organ Donations. This bill deletes the requirement in the law that a completed organ donation option certificate be attached to a death certificate in order for the death certificate to be deemed complete. This bill is necessary in order to ensure the prompt handling of the deceased once a death certificate is prepared. **Approved.**

S-1986-Rand—Prescription Benefits for State Employees. Provides that prescription requirements and allowances under the state employees program shall apply equally to local pharmacies and the mail-order program. **Approved.**

S-1995-Ewing—Blood Banks (Immunity). Provides that volunteers providing services to blood banks shall be immune from civil liability unless they have acted in a willful, wanton, or grossly negligent fashion. **Approved.**

SR-6-Costa—DRGs. Requests the commissioner of health to conduct a severity of illness study in the DRG program and to file a report with recommendation to the Legislature. **Approved.**

SR-29-Gagliano—HMO Reimbursement. Requests Congress to study the insufficient reimbursement by Medicare to HMO-New Jersey. **Approved.**

SR-41-Dorsey—Irradiation of Food. Requests Congress to impose a moratorium on food irradiation. **Disapproved,** because there is no scientific evidence that irradiation of foods is harmful.

The Reference Committee noted that a vote of thanks was extended to the chairman, Doctor Irving R. Ratner, and members of the Council on Legislation, and to Mrs. June O'Hare, staff liaison to the Council, for the yeoman's work they are doing.

The Reference Committee recommends that the supplemental report be filed.

HOUSE ACTION: Adopted. The supplemental report was filed.

Council on Legislation

IRVING P. RATNER, MD, CHAIRMAN

(Reference Committee "D")

Current State Legislation

The Council offers this Supplemental Report #2 covering items dealt with since the compilation of its Supplemental Report #1.

Senate

S-1963-Rice—HIV Antibody Testing. Requires that at the discretion of the court, persons convicted of prostitution may be required to submit to HIV-antibody testing. **Action Deferred**, pending report of MSNJ's AIDS Task Force (scheduled for Board action on April 27, 1988).

Assembly

A-13-Kavanaugh—Commercial Surrogate Parenting. Prohibits the payment of money for surrogate parenting purposes. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-56-Albohn—Legislation. Limits members of the Legislature to the prime sponsorship of no more than 35 bills. Ten bills may be pre-filed, 10 bills introduced in regular session, 10 bills with at least five cosponsors, and 5 bills with at least 20 percent of the members of the Senate or Assembly or a majority of the sponsor's political party in the given House. **No Action.**

A-73-Villane—Blood Donations. Eliminates age restrictions on blood donors. **Approved.**

A-78-Villane—Infant Mortality. Creates a Commission on Infant Mortality consisting of 15 members (4 legislators, 4 doctors, 4 nurses, and 3 commissioners). **Approved.**

A-88-Villane—Social Work. This bill would establish and license two categories of social workers and would create a Board of Social Work Examiners in the Department of Law and Public Safety whose powers and duties, among others, would be to administer the act, examine, and license candidates for the various categories of social work and promulgate rules and regulations necessary for the effective enforcement of the act. The two categories of licensed social work would be (1) social work specialists, who would be required to have a doctorate in social work or a master's degree from an accredited school of social work and (2) social workers who would need a baccalaureate degree from an accredited college or university social work or social welfare program. The bill would "grandfather" in all persons currently in practice, provided they have been in practice in one of the two licensed categories for two of the last five years and apply to be licensed within 180 days from the effective date of this act. **Active Opposition**, because there has been no demonstrative need for licensure of this occupation as a separate and independent profession.

A-110-Villane—Cancer Research. Provides that a portion of the surtax on cigarettes be dedicated to the cancer research fund. **Approved.**

A-121-Villane—Environment. Requires the state government to study the health effects of chlorinated sewage in coastal waters. **Approved.**

A-124-Villane—Medical Waste. Regulates the disposal of medical waste through a complex system which would require every doctor, dentist, etc. to register with the Department of Health and to use a manifest system which includes the filing of detailed quarterly reports. **Action Deferred**, pending further information from MSNJ's Committee on Environmental Health for report back to the Council on Legislation within 60 days.

A-130-Penn—Motor Vehicle Vision Examinations. Provides that a licensed ophthalmic dispenser may certify successful completion of the required visual examination for an operator's license. **Disapproved**, current law is preferable, at this time. Motorists may feel they are receiving a quality eye examination when, in fact, the examination merely consists of eye chart reading and a peripheral and depth perception test.

A-148-Penn—Psychologists. Permits psychologists to certify disability under the temporary disability benefits law. **Active Opposition**, psychologists do not have the educational background and experience necessary to make disability determinations.

A-163-Rocco—Certificate of Need. Provides that certificate of need shall expire after two years unless financing contracts, and necessary variances are obtained. **Conditional Approval**, pending inclusion of the following amendment—"provided the necessary variances are diligently applied for in a timely fashion."

A-211-Naples—Health Insurance. Requires medical service corporations to notify claimants of possible major medical coverage when claims are not paid in full. **No Action.**

A-212-Naples—Health Insurance. Requires hospital service corporations to notify claimants of possible major medical coverage when claims are not paid in full. **No Action.**

A-213-Naples—Major Medical Insurance. Requires certain commercial group health insurers to

notify claimants of possible major medical coverage when claims are not paid in full. **No Action.**

A-217-Naples—Health Care Services. Bars action to enforce the payment of bills for health care services for 60 days under certain circumstances. **Conditional Approval**, pending deletion of lines 33 through 35 of the statement because it is not consistent with the bill language.

A-222-Naples—School Bus Seat Belts. Requires all new school buses to have seat belts and mandates that students use them. **Approved.**

A-245-Felice—Child Abuse Prevention. Creates a 24-member commission to study the problem of child abuse and to recommend methods of prevention. **Conditional Approval**, pending the inclusion of a pediatrician and a psychiatrist on the commission.

A-250-Felice—Methadone Registry. To establish a central registry of persons enrolled in methadone programs. **Action Deferred**, pending an updated report from MSNJ's Committee on Drug and Alcohol Abuse.

A-253-Felice—Nursing Home Mental Patients. Provides that a patient transferred from a psychiatric facility to a nursing home may be returned to the psychiatric facility if a physician certifies it is unreasonable for the nursing home to retain the patient. **No Action.**

A-261-Felice—Nursing Home Preadmission. Establishes a nursing home preadmission screening program to prevent inappropriate admissions. **No Action.**

A-267-Felice—Pharmacy. Prohibits institutions from operating retail pharmacies within 1,500 feet of their facility. (N.B. This bill conditionally vetoed by the governor at the end of the 1987 Session). **Active Opposition**, this bill is anticonsumer and detrimental to the future efforts of hospitals and physicians to diversify services in order to meet cost-containment goals.

A-271-Felice—Osteoporosis. Establishes a commission (15 members) to compile and analyze data on osteoporosis, develop educational programs, and assist local health agencies in public education. **No Action.**

A-294-Kamin—Emergency Services. Allows certified EMTs to perform cardiac defibrillation with or without the assistance of another EMT. **Action Deferred**, pending further information from MSNJ's Committee on Emergency Medical Care.

A-324-Villane—Ocean Pollution. Appropriates \$1,000,000 to Department of Health for a study on the health impact of ocean pollution. **Approved.**

A-353-Cooper—Withholding or Withdrawing Treatment in Terminal Illness. Allows competent adults to issue a directive that provides they shall not be artificially sustained during a terminal condition. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-374-Kalik—Prescription Drugs. Intends to alleviate the inability of certain elderly patients to open their prescription containers that are closed with child-proof caps. Amendment to the bill would require a new box and statement on prescriptions. **Disapproved**, because existing law allows the option requested. There is no need to revise prescription blanks.

A-411-Deverin—Abortions. Would permit hospital governing boards to determine whether or not abortions can be performed in the hospital facilities. **No Action.**

A-420-Deverin—Occupational Therapy. Creates a new class of licensed practitioners who would function independently and would be permitted to perform such services as the design, fabrication, and application of splints, sensorimotor activities, the use of specifically designed crafts, guidance in the selection and use of adaptive equipment, therapeutic activities to enhance functional performance; prevocational evaluation and training, and consultation concerning the adoption of physical environments for the handicapped. The State Board of Medical Examiners will exercise jurisdiction. **Active Opposition**, there is no demonstrated public health need to create a licensed professional in occupational therapy. Currently, physical therapists and nurses are meeting the needs of this legislation.

A-424-Deverin—T.B. Test for Nursing Home Employees. Requires that all current and prospective employees of nursing homes be tested for T.B. **Approved.**

A-430-Deverin—Professional Liability. Allows organizations of professionals to form associations to self-insure professional liability. The entities created would be under special regulatory control of the Insurance Department, but are not to be considered insurance companies. **Disapproved**, because the program would not protect the public by assuring adequate financing of insurance mechanisms. Professional associations should be encouraged to form insurance carriers consistent with the insurance code.

A-435-Deverin—Medicaid. Allows the commissioner of human services to make revisions in the eligibility of the medically needy standards which are consistent with federal law. **Disapproved**, because it would subject the New Jersey poor to the control of federal agencies with no circumstantial security through state government action.

A-438-Deverin—Organ Donor Study. Creates a nine-member study commission to make recommendations on an organized donation program. Seven of the nine members are to be nominated by the New Jersey Hospital Association (NJHA). **Conditional Approval**, pending an amendment that would appoint three members from NJHA, three members from the Medical Society of New Jersey, and one member from the Department of Health to the commission.

A-448-Pelly—Impaired Health Professionals. Directs the boards responsible for licensing certain but not all health professionals to institute impaired professional programs. Professional societies would contract with the respective boards to administer the program. There are no details regarding qualifications of personnel or funding. **Action Deferred**, pending further information from MSNJ's Committee on Physicians' Health.

A-470-Colburn—DRG Study Commission. Creates a commission to study the effects of the DRG

program and the rate-setting system in New Jersey on services provided in acute care hospitals. **Active Support.**

A-472-Colburn—Certificate of Need. Creates an exemption from certificate of need requirements when the hospital and two or more physicians joint venture a project that costs less than \$2 million. **Active Support.**

A-474-Colburn—HMO Contracts. Provides that in the event that an HMO and a general hospital or other health care facility with which the HMO has a contract to provide services to its enrollees, are unable to agree on the terms of a new contract upon the expiration of the current contract, the health care facility and the HMO shall continue to abide by the terms of that contract for a period of four months from the date of expiration of the contract, during which time an enrollee of that HMO who has been receiving services from the health care facility under the terms of the previously existing contract may terminate his enrollment in the HMO and purchase health care benefits from another provider or insurance carrier. **Conditional Approval**, pending an amendment to provide that the same notification be forwarded to physicians as well as patients.

A-479-Colburn—Nursing Services. Provides that the costs associated with nursing services must be specifically identified in hospital budgets and rating formulas. **Active Support.**

A-535-Genova—Blood Donations. Provides that it is a disorderly persons offense to donate blood with knowledge that the donor has a communicable disease. **Action Deferred**, pending further information from the New Jersey Blood Banking Task Force.

A-546-Genova—Immunizations. Provides that students in public colleges must produce a medical history of their immunizations for preventable diseases. **Approved.**

A-547-Genova—Blood Donations. Requires blood banks to accept designated donations. **No Action.**

A-587-Haytaian—Physical Therapy. Prohibits physicians from having an ownership interest in a physical therapy practice or from employing physical therapists. **Active Opposition**, in favor of Senator Codey's Financial Disclosure Bill (S-734).

A-748-Shusted—Dialysis Technicians. Hemodialysis technicians would work under the supervision of physicians. This legislation would establish: 1) guidelines for training and education; 2) guidelines for recognized testing and certification procedures; and 3) guidelines to define the role and responsibilities of the hemodialysis technician. **Action Deferred**, pending further information from the New Jersey Nephrology Society and the New Jersey Renal Physicians Association.

A-789-Shusted—Medicaid Coverage. Requires Medicaid coverage of patterning. **Disapproved**, because patterning has not been scientifically accepted and is both controversial and experimental.

A-791-Shusted—Immunity. Provides that volunteer officers and directors of nonprofit corporations shall be immune from certain types of suits. **Approved.**

A-834-Otlowski—Drug Abuse Treatment. Makes drug abuse treatment an included item under all types of health insurance. **Approved.**

A-835-Otlowski—Drug Abuse Treatment. Same as A-834. **Approved.**

A-836-Otlowski—Drug Abuse Treatment. Same as A-834. **Approved.**

A-837-Otlowski—Drug Abuse Treatment. Same as A-834. **Approved.**

A-838-Otlowski—Drug Abuse Treatment. Same as A-834. **Approved.**

A-865-Otlowski—Mental Health/Involuntary Treatment. Assures persons receiving treatment on an involuntary basis in either a screening service or short-term facility of the same rights as patients who have been involuntarily committed to state or county psychiatric facilities. **Action Deferred**, pending further information from MSNJ's Council on Mental Health.

A-886-Kern—Medical Licensure. Increases the penalties for using false credentials to obtain a license or to represent oneself as licensed. Applies to medicine and chiropractic. **Active Support.**

A-887-Kern—Medical Directives. Establishes a procedure and system for execution of medical directives and medical powers of attorneys. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-908-Kern—Wrongful Death. Requires that when a wrongful death settlement is "structured," the court will determine prior to the settlement who will receive and in what proportions. **Approved.**

A-918-Kern—Medical Records. Requires hospitals and physicians to provide patients with copies of their records within 30 days of a request by the patient or their representative. **Approved** (conditions already law and would have no effect).

A-951-Kern—Organ Donation. Establishes a recording system for donation cards in the office of the county clerk and the bureau of vital statistics. Physicians or their designees are to inquire as to whether cards are on file. **Disapproved**, unworkable legislation.

A-952-Kern—Organ Sale. Prohibits the sale or purchase of organs. **Approved.**

A-953-Kern—Informed Consent/Fertility Drugs. Provides for statutory informed consent related to the administration of fertility drugs. **Disapproved**, MSNJ is opposed to interference with the practice of medicine by legislation.

A-954-Kern—In Vitro Fertilization. Sets forth the rights and liabilities of persons who wish to participate in alternative reproductive arrangements. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-955-Kern—Artificial Insemination. Statutorily regulates artificial insemination, requires certain forms of consent, data gathering, and recordkeeping. **Disapproved**, mandates the practice of medicine by legislation.

A-956-Kern—Surrogate Motherhood. Provides for the recognition of detailed surrogate parenting

arrangements and contracts. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-957-Kern—In Vitro Fertilization. Provides that unless there is a written agreement to the contrary, the female party shall have the right of possession of a frozen embryo conceived through in vitro fertilization. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-958-Kern—Sterilization. Requires a physician who is requested to perform a vasectomy, tubal sterilization, or other surgical sexual sterilization procedure to inform the patient of the potential for the operation to fail to result in sterility. Also, requires the physician to inform the patient about procedures for storage of reproductive cells for future use. **Disapproved**, since the intent of the bill is to create a standard of medical practice in New Jersey, it is more appropriate to be acted upon by SBME.

A-960-Kern—Psychotherapy/Immunity. Grants civil immunity to psychotherapists for failure to report potentially violent behavior of patients unless there is a readily identifiable victim. **Approved.**

A-963-Kern—Anatomical Gifts (Anencephalic Infants). Provides a method of organ donation from anencephalic infants. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-966-Kern—AIDS. Provides that anyone with AIDS who knows of their infection and commits an act of sexual penetration is guilty of a crime of the third degree. **Conditional Approval**, the bill is legally malconstructed since the legal and medical portion of the bill is in error.

A-976-Kern—Insurance. Requires health insurers to pay for treatment of infertility. **No Action.**

A-979-Kern—Medical Directives for the Terminally Ill. Provides that certain family members may request the attending physician to withhold or withdraw treatments of comatose patients who are terminally ill even though the patient did not execute a written directive. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-988-Cooper—Autopsy. Requires county medical examiners to make autopsy reports available to family members within 45 days of request. **Action Deferred**, pending further information from Robert Goode, MD, the medical examiner of the state of New Jersey.

A-1024-Collins—Nursing Salaries. Requires the Hospital Rate-Setting Commission to approve an immediate increase of 2 percent in nursing salaries. Also, requires the commissioner of health to contract with a private agency to conduct salary surveys in neighboring states for comparison to those in New Jersey. **No Action.**

A-1039-Singer—Pertussis Vaccine. Requires the commissioner of health to make available to all health providers and parents a pamphlet on adverse reactions to pertussis immunization. The health care provider must give the pamphlet to the parent before administration of the vaccine and must complete and maintain detailed records. Adverse reactions are to be reported to the manufacturer and the Centers for Disease Control. **Disapproved**, the Department of Health can accomplish this under existing law and regulatory authority.

A-1043-Singer—Abused Elderly. Requires reporting of cases of abuse of the elderly and the disabled; establishes a system of protective custody; exempts as abuse acts of withholding treatment that conflict with the patients' religious beliefs. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-1047-Singer—Child Abuse Diagnostic Center. Establishes a child abuse diagnostic center in southern New Jersey. **Disapproved**, because there is general availability of these services and talents at most acute care hospitals in New Jersey—special legislation is not needed.

A-1061-Roma—Certificate of Need. Establishes a study commission to evaluate the CON (Certificate of Need) program. **Approved.**

A-1082-Moran—Medicare (Physician Fee Complaints). Establishes a public blacklist to be compiled by the Division of Aging on those physicians whose fees exceed Medicare allowances. **Active Opposition.** Medicare allowances are about 60 percent of usual fees. Further congressional budget cuts will lower them further. The compiling of a list will mislead patients from realizing that doctors are being paid less than they bill. This type of misinformation should be avoided.

A-1104-Moran—Ocean Pollution Study. Requires the commissioner of health to conduct a three-year study of infections contracted by swimming in state coastal waters. Report forms are to be distributed to physicians who shall return them to the Department of Health. **Approved.**

A-1126-Moran—Prescription Drugs. Prohibits mail-order prescription drugs in the benefits program for public employees. **No Action.**

A-1157-Bryant—Withholding Medical Treatment. Amends Title 26 of the Revised Statutes (health code) and establishes a procedure whereby a document, executed in conformity with the Will Statutes, can be relied upon by physicians to withhold or withdraw artificial life-sustaining treatment. **Action Deferred**, pending further information from MSNJ's Committee on Biomedical Ethics.

A-1166-Bryant—Medical Education. Provides for the chancellor of higher education to contract with Meharry Medical College and School of Dentistry, located in Nashville, Tennessee, to export five to ten medical students and three to five dental students into each Meharry class. Admission will be solely on academic merit. Students shall come from disadvantaged or minority background. **Disapproved**, the purpose of this bill can best be resolved by utilizing educational facilities within the state. (N.B. UMDNJ has a very good minority program.)

A-1237-Rooney—Health Care Providers. Provides for the certification of homemaker-home health aides. **Disapproved**, because MSNJ is opposed to new licensure requirements unless a clear public need is demonstrated.

A-1341-Ogden—School Bus Seat Belts. Requires the Department of Education to reimburse school districts for 90 percent of the costs of installing seat restraints in school buses. **No Action.**

A-1343-Ogden—Mental Health Benefits. Requires health insurers and HMOs to require specified amounts of mental health benefits as mandated coverage. **Approved.**

A-1344-Ogden—Mental Health Benefits. Same as A-1343. **Approved.**

A-1345-Ogden—Mental Health Benefits. Same as A-1343. **Approved.**

A-1346-Ogden—Mental Health Benefits. Same as A-1343. **Approved.**

A-1347-Ogden—Mental Health Benefits. Same as A-1343. **Approved.**

A-1348-Ogden—Mental Health Benefits. Same as A-1343. **Approved.**

A-1413-Randall—Political Contributions. Limits PAC contributions to \$2,500 per calendar year. **Disapproved,** limiting the amount which a PAC could contribute to a legislative candidate would disadvantage the individuals who pool their resources in a PAC.

A-1425-Kline—Marriage Licenses. Requires applicants for a marriage license to undergo HLTV-III testing. Physicians are to notify applicants of the test results, in writing. Positive results must be reported to the Department of Health. **Disapproved,** mandatory HIV testing is not cost effective and there is a high incidence of false positives.

A-1428-Kline—HIV Testing. Requires persons who are charged with certain sexual crimes to be tested for HIV sensitivity. **Approved.**

A-1455-Kline—Insurance. Prohibits denial of health insurance because a person is HIV positive or has AIDS. **No Action.**

A-1456-Kline—Organ Transplants. Prohibits organ transplants unless the tissues are HIV negative. **Disapproved,** unnecessary legislation.

A-1457-Kline—AIDS (Funeral Directors). Requires doctors, nurses, or the medical examiner to notify the funeral director in writing if the decedent had or was suspected of suffering from a communicable disease. **No Action.**

A-1460-Kline—AIDS Reporting. Requires that patients with positive HLTV-III be reported to the Department of Health within 72 hours. The Department of Health shall institute contact tracing. All information is to be confidential. **No Action.**

A-1464-Kline—AIDS Confidentiality. Makes it a crime of the fourth degree for state employees to make an unauthorized disclosure of AIDS reports which have been submitted to the Department of Health. **No Action.**

A-1468-Kline—Medical Transport. Requires all medical transport systems to accept patients with AIDS. **Approved.**

A-1532-Doria—Chiropractic. Creates a licensing board for chiropractic. Transfers all functions and responsibilities of the State Board of Medical Examiners regarding chiropractic to the new board. Removes the place for a chiropractor from the medical board. **Active Opposition,** because there is no demonstrative need for this legislation. Chiropractors are adequately supervised under the jurisdiction of the New Jersey State Board of Medical Examiners.

A-1538-Doria—Professional Liability. Requires that all closed professional liability claims be reported to the Department of Insurance. **Active Opposition,** closed claims with payments already are reportable.

A-1542-Doria—Hospital Practice By Dentists. Permits dentists who have had their credentials approved to practice in hospitals. **Active Opposition,** this bill would allow dentists to make medical diagnosis and medical decisions for which they have not been properly educated.

A-1544-Doria—HMO Free Choice of Provider. Allows HMO beneficiaries free choice of provider. Limits HMO liability to its established fee schedule. In the case of capitation or salaried plans, the Medicaid fee schedule would be used. **Active Support.**

A-1591-Bennett—Licensing of Health Professionals. Requires statutory authorization for the licensure or certification of health care practitioners. **Active Support.**

A-1600-Kelly—Nurse Practitioners. Allows nurses who practice in collaboration with physicians to prescribe medications in accordance with protocols submitted to and approved by the State Board of Nursing. **Active Opposition,** nurses are not qualified to make medical diagnosis nor to prescribe therapeutic medications.

A-1673-Brown—Infant Mortality. Creates an infant mortality prevention program in the Department of Health to provide obstetrical and prenatal services to women with high-risk pregnancies. Also, provides postpartum followup services. Seven hospitals are designated by statute with three to be added by the commissioners. Two million dollars is appropriated. **Approved.**

A-1678-Brown—Seat Belts. Requires seat belt use by all persons under 18 regardless of where in the vehicle they are seated. **No Action.**

A-1700-Martin—Registry for Head Injuries. Requires physicians and hospitals to report patients with head injuries to the Department of Health. **Disapproved,** unworkable legislation, because the number of cases would be infinite due to the various types of injuries.

A-2305-Karcher—Mandatory Medicare Assignment. Requires health practitioners to accept Medicare assignments. **Active Opposition,** participation in any health plan is not a valid licensure criteria, there is no evidence that a draconian measure of this nature is necessary since over 70 percent of physicians claims are paid on assignment. The bill violates the New Jersey and United States Constitution.

AR-29-Farragher—Medicare Fees. Requests Congress to raise fees to doctors participating in Medicare. **Active Support.**

At its meeting on Wednesday, April 27, 1988, the Board of Trustees approved all the positions recommended by the Council on Legislation on Supplemental Report #2, with the exception of the following which were amended to read as follows:

a. **S-1963-Rice—HIV Antibody Testing.** This bill requires that at the discretion of the court, persons convicted of prostitution may be required to submit to HIV-antibody testing. The Council had taken a position of action deferred, pending report of MSNJ's Task Force on AIDS. The Board voted to change the position on S-1963 to **Conditional Approval**, provided the bill is amended to require HIV-antibody testing for individuals arrested for prostitution or other sexual crimes.

b. **A-267-Felice—Pharmacy.** This bill prohibits institutions from operating retail pharmacies within 1,500 feet of their facility. (N.B. This bill conditionally vetoed by the governor at the end of the 1987 session.) The Council had taken a position of active opposition, as this bill is anticonsumer and detrimental to the future efforts of hospitals and physicians to diversify services in order to meet cost-containment goals. The Board changed the position on A-267 to **Action Deferred**, pending discussion with the New Jersey Hospital Association.

c. **A-271-Felice—Osteoporosis.** This bill establishes a commission (15 members) to compile and analyze data on osteoporosis, develop educational programs, and assist local health agencies in public education. The Council had taken a position of no action. The Board changed the position on A-271 to **Disapproved**, because osteoporosis is a well-known, researched, and publicized condition, and there is no need to create a special legislative commission to conduct studies when comprehensive, scientific literature is readily available (same as S-1163).

d. **A-472-Colburn—Certificate of Need.** This bill creates an exemption from certificate of need requirements when the hospital and two or more physicians joint venture a project that costs less than \$2 million. The Council had taken a position of active support. The Board changed the position on A-472 to **Action Deferred**, pending discussion with the New Jersey Hospital Association.

The Reference Committee noted that a vote of thanks was extended to the chairman, Doctor Irving P. Ratner, and members of the Council on Legislation, and to Mrs. June O'Hare, staff liaison to the Council, for the yeoman's work they are doing.

The Reference Committee recommends that the supplemental report be filed.

HOUSE ACTION: Adopted. The supplemental report was filed.

Council on Public Relations

FRANK PRIMICH, MD, CHAIRMAN

(Reference Committee "D")

The Council on Public Relations maintains the continuity of our coordinated public relations program in reaching the public, the membership, and the media. The Council studied a variety of projects and instituted those falling within the mandates of the House of Delegates, the Board of Trustees, and the available resources.

1. Resolutions from the House of Delegates—1987 Annual Meeting.

A. Resolution #14—Free Choice of Physician.

Resolved, that the Medical Society of New Jersey establish a program by which the component societies will be assisted in educating the public as to the advantages of free choice of physician by making physician members available to speak to any individual or group that has been solicited by a representative of a prepaid plan that uses participating physician panels.

The Council discussed the recommendation included in Resolution #14 proposing that physician members be made available to promote advantages of free choice of medical service to individuals or groups who have been solicited by representatives of a prepaid health care plan that uses physician advocate panels. The most support for HMO-type delivery of health care comes from corporation and union groups. They indicate health care delivery is the single greatest cost in their participant benefit program. They indicate contracts with HMOs give them control of cost and delivery that cannot be obtained otherwise.

The development and implementation of a competitive "free choice" program would have to be competitive to the many options offered by the HMOs and comparatively priced. There apparently is no way MSNJ could determine what individuals or groups were being solicited privately by HMOs unless it was volunteered. A competitive "free choice" program would need to be administered and audited for quality and delivery of care. The largest single alternative to "free choice" is self-insured corporation programs and they are increasing according to a Blue Cross/Blue Shield survey. An attack on alternative health care programs that did not offer supporting evidence of a "free choice" delivery system that was equal or superior to the competition would present the possibility of legal action.

There are problems involved in offering a specific promotion elaborating the merits of a singular type of health care delivery when 40 percent of MSNJ's membership are involved with HMOs and other similar types of practice.

We have considerable input from the public listing their complaints regarding some of the alternate health care systems. Rather than get into negative finger pointing controversy via the media, we will continue to encourage the public to investigate all the options. We repeatedly suggest they exercise the privilege of discussing their health care concerns with their doctors.

The new ad—"Health Care Options. They're Enough To Make You Dizzy"—was published in daily newspapers on August 27, 1987. The ad strongly suggests careful evaluation of alternative health care options before accepting them. The Council on Public Relations is of the opinion this ad addressed the free practice of medicine without offending membership or promoting legal problems. This type of promotion was expanded to continue to address "free choice of physician."

B. Resolution #20—MSNJ Public Relations Activities.

Resolved, that the Medical Society of New Jersey make an all-out public relations effort to include, but not be limited to, a regular, planned series of: articles and press releases; and appearances on talk shows and public speaking engagements, as well as Society-sponsored and produced shows on cable TV, designed to articulate the Society's position in regard to professional liability and governmental intrusion into the practice of medicine.

The Council is planning implementation of this Resolution, excluding electronic media programs because they are not within the fiscal capacity of the Medical Society of New Jersey.

C. *Substitute Resolution #24—Mandatory Assessment for Patient Education.* The third resolved of Substitute Resolution #24 was, "that the Board of Trustees explore opportunities for cooperation with neighboring state societies (Delaware, New York, Pennsylvania, and Connecticut) in the sponsorship of medical programs."

On June 1, 1987, letters were sent to the state medical societies of Delaware, New York, Pennsylvania, and Connecticut, asking for comments on the proposal. The response of all four medical societies was unfavorable, and no further action was contemplated.

2. Continuing Projects.

A. Publication and distribution of: (1) *Membership Newsletter*; and (2) *Monthly PR releases*: Health Care Package; Average Hospital Stay; No To Mandatory Medicare; Enough To Make You Dizzy-Options; Don't Let The Genie Out Of The Bottle; 10 Ways To Cut Medical Expenses; Don't Stop Depending On Your Doctor; Is Your Doctor Keeping Up With Today's Medicine? 75 Percent Of Lawsuits Against Doctors Are Thrown Out Of Court; HMOs—How It Affects Your Choice; HMO Solicitations; Free Choice Of Doctors; Drunken Driving; Truth About Medicare; Which Medical Insurance Plan Is For You; Have A Complaint? Will There Be A Doctor Available? There were multiple media releases in the newspapers across the state and in *Newsweek* and *Time* magazines addressing alternate health care options.

B. Preparation and publication of special news releases and publicity as required from time to time in furtherance of the Society's business interest and activities, including: 1) Annual Meeting; 2) selected official programs and activities; and 3) professional liability—through newspaper articles explaining MSNJ's position on professional liability, DRGs, and Medicare.

C. The Golden Merit Award ceremony continues to be an important function at which our senior physicians, who have held the degree of Doctor of Medicine for 50 years, receive special recognition. In 1987, 117 physicians were so recognized, making a total of 2,027 since the awards began in 1957. The recipients and their families receive undivided attention from the state and county leaders prior to the formal awards ceremonies and during the reception that follows.

D. Encouragement of the continuance or establishment of orientation programs for new members by the component societies.

E. Placement services in *NEW JERSEY MEDICINE*.

F. Encouragement of medical television programs of informational value to the public—Channel 9-13 (cable) plus commercial stations in New York and Philadelphia, plus political action program support (NJPT).

G. Coordinate efforts of the Council on Public Relations with the Committee on Drug and Alcohol Abuse for future MSNJ involvement in drug abuse education and prevention.

3. **Newspapers.** During the past year, we publicized health topics such as the cost of medical care, choosing your own doctor, professional liability, drunken driving, driving while drug impaired, health care options, mandatory Medicare assignment, Medicare premium increase, depending on your doctor, and keeping up with modern medicine.

4. **Magazines.** *Newsweek* and *Time*—DRG Statistics; Don't Let the Genie Out of the Bottle; Is Your Doctor Keeping Up? 75 Percent Of Lawsuits Against Doctors Are Thrown Out Of Court.

5. **Television.** In 1987, public service announcements aired out of New York and Philadelphia and reached over three million viewers. This is our most effective method of reaching the population of New Jersey. Cooperation from the television stations and radio stations running our material continued to be excellent. The air time is provided free as a public service on subjects such as AIDS, Medicare, DRGs, Health Care Options, answers to the SCI Report, cutting your medical expenses, cocaine abuse, and seeing your doctor.

6. **Special Programming.** Development of new TV media programming on DRGs, Medicare, Medicaid, AIDS, and legislative activities.

Participation on Governor's Committee on Highway Safety.

Participation on Governor's Committee on Child Abuse.

Support of Eye Health Screening Promotion.

The Council on Public Relations in cooperation with the Committee on Drug and Alcohol Abuse continues to make public service promotions on the hazards of the misuse of drugs.

Talk Shows. Considerable effort was extended in exploring electronic media outlets in Philadelphia and New York to determine interest in programming talk shows on DRGs, AIDS,

doctor population, Medicare, HMOs, and PROs. There was not much interest in donating air time by the station programmers for subjects that have frequented the media of late. The cost of buying time combined with the lack of proper funding prevents any further effort for talk shows. The difficulty in arranging busy physician speakers for committed air time further complicated this effort. The exception being Dr. Primich's appearances on TV Channel 9 and a Philadelphia radio station.

PR Support of Legislative Efforts by Katz Martin Brill & Company. The Society's battle to defeat the mandatory Medicare assignment bill (A-2511) gave the Council on Public Relations one of its greatest-ever challenges as well as its biggest victory in 1987. Sponsoring the election returns on New Jersey Network on the evening of November 3. Sponsorship of the program provided us seven spots, consisting of the Society seal, name and voice-over that the program was being sponsored by the Medical Society of New Jersey. Preparing and generating media interest in a press release announcing the Society's retaining former U.S. Judge Herbert J. Stern as special counsel in response to the SCI report on impaired and incompetent physicians; coordinating campaigns against three major anti-medicine bills: A-2647, which would prohibit physicians from employing physical therapists or having a financial interest in any facility (such as a cardiac rehab center) which offers physical therapy, S-2261, which would permit optometrists to diagnose and treat eye disease as if they were physicians, and S-2721, which would authorize nurses to diagnose disease and prescribe drugs. All three bills were stopped.

Appreciation was expressed for the efforts of Doctor Frank J. Primich, chairman, and the members of the Council on Public Relations during the past year. It was the feeling of the Reference Committee that the Council on Public Relations should do more to promote the senior citizens program adopted by the 1987 House of Delegates (Resolution #27).

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Resolution #1

Introduced by: Essex County Medical Society
Subject: Freedom of Choice for Residency Program Directors
Referred to: Reference Committee "D"

Whereas, graduate medical education programs in the various specialties are reviewed and accredited by residency review committees of the respective specialties; and

Whereas, the program directors of these residency programs have the clearest opportunity to assess the qualifications of applicants to these programs; and

Whereas, this assessment includes review of written application and personal interviews; and

Whereas, the particular local needs of the program are best known by the respective program directors; now therefore be it

Resolved, that the Medical Society of New Jersey adopt the policy that: a) Candidates for residency programs should be selected solely on the basis of the qualification and merit as determined by local residency program directors and their selection committees. b) No *quota-restriction* should be imposed on these program directors by any governmental agency with respect to funding of programs based upon composition of American or foreign-trained physicians so long as these programs are approved by their respective residency review committees; and be it further

Resolved, that a similar resolution be sent to the American Medical Association for adoption at its annual meeting in June 1988.

The Reference Committee recommends that Resolution #1 be adopted with one editorial change (noted in *italics*).

HOUSE ACTION: Adopted. Resolution #1 was adopted with the editorial change.

Resolution #13

Introduced by: Union County Medical Society
Subject: Foreign Medical Graduates
Referred to: Reference Committee "D"

Whereas, medical graduates of foreign medical schools have passed the required examinations and completed residency training programs and are licensed to practice medicine in the United States of America. Many of them are certified by the specialty boards; and

Whereas, 20 percent of the AMA membership is composed of foreign medical graduates, who are loyal and support the AMA; and

Whereas, many of them are willing to provide a high level of care in underserved areas; and

Whereas, the unity of the AMA is extremely important to all its members; now therefore be it

Resolved, that the Medical Society of New Jersey request the AMA to establish a policy to oppose discrimination in any form or manner based on sex, ethnic background, country of origin, or location of medical school; and be it further

Resolved, that the Medical Society of New Jersey request the AMA to strive to remove discrimination in residency training programs, admission to examinations, medical staff, academic appointments, and professional society memberships; and be it further

Resolved, that the Medical Society of New Jersey request the AMA to join with its state and local medical and specialty medical societies to remove discrimination in licensure requirements based on geographical location of the medical school.

All comments made at the meeting were in favor of the Resolution.

The Reference Committee recommends that Resolution #13 be adopted.

HOUSE ACTION: Adopted. Resolution #13 was adopted.

Resolution #16

Introduced by: Philip Brien, MD, Delegate Essex County
Subject: Equality of Testing Foreign Medical Graduates
Referred to: Reference Committee "D"

Whereas, foreign medical students and graduates of foreign medical schools now are required to take a separate examination in order to qualify for graduate medical education in the United States; and

Whereas, graduates of American medical schools take a different examination than that given foreign medical graduates; and

Whereas, all applicants for graduate medical education and licensure should be held to the same standard as measured by a single examination; and

Whereas, the AMA Council on Medical Education, at the 1987 Annual Meeting, recommended that "the AMA urge the Educational Commission for Foreign Medical Graduates to consult with the National Board of Medical Examiners concerning the possible use of Parts I and II of the National Board Examination for ECFMG Certification"; and

Whereas, there has been no noticeable movement in achieving the goal of a single, unified examination for both American and foreign medical graduates; and

Whereas, the Medical Society of New Jersey repeatedly has addressed the American Medical Association on this issue; now therefore be it

Resolved, that the Medical Society of New Jersey strongly urge the American Medical Association, in accordance with the spirit of Recommendation V of the report of the Council on Medical Education which was adopted by the House of Delegates in June 1987, to call upon the National Board of Medical Examiners and the Educational Commission for Foreign Medical Graduates to implement promptly the administration of a single test to all applicants for graduate medical education in the United States; ~~and be it further~~

~~**Resolved**, that the American Medical Association call upon the United States Congress to amend the law so as to require that all applicants for graduate medical education be administered the National Board of Medical Examiners' examination Parts I, II, and III, without regard to the source of the individual's educational background, so long as it is from a school approved by the country of its location.~~

All comments made at the meeting were in favor of the Resolution.

The Reference Committee recommends that Resolution #16 be adopted.

HOUSE ACTION: Not adopted. Resolution #16 was adopted as amended by the House.

Resolution #17

Introduction: Carlo Porcaro, MD, Delegate Essex County
Subject: Endorse Formation of a Section on Foreign Medical Graduates Within the Structure of the AMA
Referred to: Reference Committee "D"

Whereas, foreign medical graduates have been subjected to deliberate discrimination with regard to opportunities in residency training; and

Whereas, foreign medical graduates are faced with both intentional and unintentional discrimination in obtaining practice opportunities; and

Whereas, the United States Senate has continued the assault on funding for foreign medical graduates in graduate medical education; and

Whereas, foreign medical graduates feeling a strong allegiance to the American Medical Association and comprising more than one-fourth of its membership, feel that issues relating to their unique position should be given a more thorough hearing within the American Medical Association; and

Whereas, Report MM of the American Medical Association Board of Trustees (A-87) recommended the establishment of such section; now therefore be it

Resolved, that the Medical Society of New Jersey support the formation of a section on foreign medical graduates within the structure of the American Medical Association; and be it further

Resolved, that the New Jersey delegation to the American Medical Association introduce a similar resolution at the 1988 AMA Annual Meeting.

There was much discussion in favor of this Resolution. Mention was made that this Resolution was considered at the AMA last year and was defeated, based on comments of a number of foreign medical graduates who felt that they had integrated into the mainstream of medicine and that a section on foreign medical graduates would be counterproductive. On the other hand, in the discussion of this Resolution, a number of foreign medical graduates felt that they were being discriminated against by the AMA and that such a section would be beneficial in answering their needs. The Reference Committee, therefore, felt that if the foreign medical graduates themselves perceive the need for such a section, the creation of a section with the AMA should be supported.

The Reference Committee recommends that Resolution #17 be adopted.

HOUSE ACTION: Not adopted. Resolution #17 was rejected.

1988 HOUSE OF DELEGATES

**Medical Society of New Jersey
222nd Annual Meeting
April 28 - May 1, 1988**

REFERENCE COMMITTEE "E"

REPORTS

**Council on Mental Health
Council on Public Health
Board of Trustees' Item: Task Force on AIDS
Resolutions #14, #15**

MEMBERS

**Leticia V. deCastro, MD, Chairman
Anthony J. DiCroce, MD
William W. Fithian, MD
Maceo M. Howard, MD
Stephen R. Shapiro, MD
Om P. Sawhney, MD, Alternate Member**

Council on Mental Health

CHURCHILL L. BLAKEY, MD, CHAIRMAN

(Reference Committee "E")

1. **Resolution on Psychiatry.** The Council on Mental Health, after careful deliberations, agreed that the Society should recommend that any patient with a mental illness in need of treatment should be seen for assessment and formulation of treatment recommendations prior to referral to a nonmedical mental health professional. Mental illness is defined as those disorders listed in the diagnostic and statistical manual of the American Psychiatric Association. It must be assured that both biological and social factors in the causation of a mental disorder are identified and adequately addressed in the treatment plan.

As a result, the Council on Mental Health submitted the following Resolution which was approved by the Board of Trustees at its meeting on December 20, 1987:

Whereas, the Medical Society of New Jersey seek to ensure continued high-quality medical care of all patients; now therefore be it

Resolved, that the Medical Society of New Jersey encourage the practice of consultation with a psychiatrist for evaluation, assessment, and recommendations before referring to nonmedical mental health professionals in the course of treating a patient with a mental illness.

2. **Mental Health Services Booklet.** The Council on Mental Health met once, on October 28, 1987, and reorganized. At this time the Council concluded that an update of the Mental Health Services Booklet (statewide directory is from 1974) is worthy but unfundable unless alternative sponsorship was found (\$6,000 for printing and distribution).

3. **New Jersey State Department of Health—Child and Adolescent Acute Psychiatric Bed Standards.** The Council set in motion commentary (with the New Jersey Psychiatric Association) on the New Jersey State Department of Health Certificate of Need: Psychiatric Inpatient Beds—Child and Adolescent Acute Psychiatric Bed Standards. New Jersey Psychiatric Association comments were received by the Department of Health.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Council on Public Health

CHARLES J. MOLONEY, MD, CHAIRMAN

(Reference Committee "E")

1. **Educational Seminar on Counseling Related to HIV Testing.** The Council on Public Health considered the need for guidelines and training in counseling of HIV positive patients. It was agreed that not all physicians are equipped to counsel such patients. However, though many refer their patients to other entities for counseling, some physicians wish to take an active part in this phase of treatment and would be interested in education in this area.

As a result of these deliberations, the Council recommended that the Medical Society of New Jersey sponsor an educational seminar for physicians on counseling related to HIV testing. The Board of Trustees approved this recommendation at its meeting on December 20, 1987, and a seminar is scheduled for March 16, 1988, entitled "AIDS, The Physician, and The Patient."

2. **Multidisciplinary Consultation in Cancer Treatment Planning.** The Committee on Cancer Control reviewed a letter from a radiation oncologist asking for endorsement of the concept of multidisciplinary consultation treatment planning for cancer patients.

The Committee on Cancer Control has gone on record as encouraging all hospitals in New Jersey to participate in the approval program of the Commission on Cancer of the American College of Surgeons, thereby voluntarily submitting themselves to review and, if necessary, upgrading their multidisciplinary approach to cancer. Their goal is to bring every general medical and surgical hospital in New Jersey into the approval process of the Commission on Cancer.

For these reasons the Committee on Cancer Control submitted the following recommendations which were approved by the Board of Trustees at its meeting on December 20, 1987:

- a. That the Medical Society of New Jersey endorse the concept of multidisciplinary consultation by diverse medical specialties such as surgery, medicine, radiation, therapy, and pathology in the evaluation and management of cancer patients.
- b. That the Medical Society of New Jersey endorse the American College of Surgeons approval program, including the multidisciplinary tumor board/conference and the hospital tumor registry.
- c. That all hospitals be encouraged to participate in the program and seek full approval.

3. **Ocean Pollution Study.** The Committee on Environmental Health has played an active role as intermediary between the New Jersey Department of Health and the organization Save Our Shores in formulating and implementing a study of ocean pollution. A preliminary study was done this year with a final formal study to be conducted during the summer of 1988.

4. **Eye Health Screening Program.** The Council's Committee on Conservation of Vision is responsible for the Eye Health Screening Program, sponsored by the Medical Society of New Jersey, which has been held annually for 30 years. In 1987, it was held the week of October 5, with 6,944 persons being screened. Out of that total, 413 glaucoma suspects were found.

The Reference Committee recommends that the report be filed.

HOUSE ACTION: Adopted. The report was filed.

Board of Trustees' Item

TASK FORCE ON AIDS

HARRY M. CARNES, MD, CHAIRMAN

(Reference Committee "E")

The Task Force on AIDS was appointed in December and charged with recommending AIDS policy and providing AIDS education for New Jersey physicians.

Meetings of the Task Force were held on January 27, February 24, and March 23. The Board of Trustees considered the recommendations offered by the Task Force on AIDS on April 10, and took the following actions:

Social/Ethical Issues

(a) *Refusal To Treat.* The Task Force recognizes the right of the physicians to determine which patients he/she will serve. The Task Force believes that a categorical refusal to treat patients with AIDS is morally and ethically unacceptable.

(b) *Confidential Versus Anonymous.* The Task Force recognizes that all HIV positive test results be kept confidential (patient's name with a number) as opposed to being kept anonymous (John Doe and a number).

(c) *Distribution of Free Needles to Addicts.* The Task Force recommends that free needles not be distributed to addicts as a means of suppressing the AIDS virus, but supports an increase of funding for drug treatment centers thereby reducing the present waiting time to get into a program.

(d) *Education.* The Task Force recommends mandatory AIDS education programs be established in the New Jersey public school system.

Items (a) through (d) were approved by the Board of Trustees.

HIV Testing

(a) *HIV Testing.* The Task Force recommends that HIV testing be performed whenever it is clinically indicated. Positive test results should never be used as a means of discrimination in the care and treatment of individuals. Testing for AIDS should include documentation as to the need for the test, confidentiality, and pre- and post-counseling.

(b) *Hospital Patients.* The Task Force recommends that all patients in high-risk groups be tested, as well as any other patient when it is clinically indicated, e.g., organ donors. HIV testing should be utilized as a diagnostic procedure, and not as a method to screen individuals for procedures. Hospitals should establish a policy to assure HIV testing does not result in discrimination against those infected.

(c) *HIV Office Testing.* The Task Force recommends that HIV testing be performed through a licensed reference laboratory, coupled with patient counseling under the auspices of a physician.

(d) *Premarital Testing.* Because mandatory premarital testing is not cost-effective and would result in a high incidence of false positives, the Task Force recommends physicians encourage and assist in the decision of those in high-risk groups to be voluntarily tested.

(e) *Life Insurance.* The Task Force does not recommend mandatory or compulsory testing of those seeking life insurance, but respects the rights of insurance providers to ask if an individual is HIV positive. However, individuals should be informed if they are to be tested for HIV. If the results prove positive, the individual's physician of record must be notified for counseling of the individual.

(f) *HIV Positive Health Care Personnel.* The Task Force recommends that each hospital establish its own policy and mechanism to determine the scope and performance of health care personnel who are HIV positive.

(g) *Pregnancy.* The Task Force recommends routine testing, with informed consent, of all pregnant women who are in high-risk groups and/or those residing in high-risk geographic areas. If the patient refuses, a waiver should be obtained confirming refusal.

(h) *United States Citizens Who Have Lived or Traveled Abroad.* The Task Force recommends testing of any citizen who has lived or traveled abroad to high-risk geographic areas

for three months or more, and that the test be repeated three months after the initial test.

(i) *State and County Prisoners.* The Task Force recommends that all new prisoners be tested, with a repeat test after three months, and further, that all HIV positive prisoners be separated from the general prison population.

(j) *Sexual Crimes and Prostitution.* The Task Force recommends that mandatory testing be implemented for anyone arrested for a sexual crime or prostitution.

(k) *Testing in Drug Clinics.* The Task Force recommends mandatory testing of individuals in drug rehabilitation programs.

Items (a) through (k) were approved by the Board of Trustees.

Proposed Legislation

Note: The Task Force recommends that all proposed legislation use common terminology, i.e. HIV antibody testing rather than antibody, and HIV positive rather than AIDS.

A-1425. Requires applicants for marriage licenses be tested for antibodies to HIV, the causative agent of AIDS. The Task Force recommends disapproval of A-1425, because HIV testing as a requirement for a marriage license is not cost effective and there is a high incidence of false positives. Consideration of A-1425 was postponed until the April 27, 1988, meeting of the Board.

A-1457. Requires funeral directors to be notified of death related to AIDS or any communicable disease. The Task Force recommends disapproval of A-1457, because this legislation imposes an inordinate burden on the physician. If funeral directors follow the universal precautions outlined in the Centers for Disease Control guidelines regarding patient's blood and body fluids, legislation becomes unnecessary. The Board voted to take no action.

A-1460. Report all cases of AIDS or positive tests for AIDS antibody to the Department of Health for followup tracking. The Task Force supports the concept, but recommends no action on A-1460, since the Department of Health has a program in process and is gathering data to determine whether tracking is successful with HIV patients. The Board approved the position on A-1460 as recommended by the Task Force on AIDS.

A-1464. Unauthorized disclosure of certain information pertaining to AIDS as a crime of the fourth degree. The Task Force recommends no action on A-1464, because there are adequate laws and regulations which sufficiently address unauthorized disclosure. The Board approved the position on A-1464 as recommended by the Task Force on AIDS.

A-2524. Reporting seropositive test results to spouse made mandatory. The Task Force favors the concept, but recommends *conditional approval* of A-2524 if amended to include enlargement of spouse category to nonspousal sexual partner, and reporting of the seropositive individuals to the Department of Health who, in turn, would contact the spouse/nonspousal partner. The bill should contain immunity for the physician from civil liability. The Board approved the position on A-2524 as recommended by the Task Force on AIDS.

S-1481. Establishes AIDS Advisory Council. The Task Force recommends approval of S-1481, with consideration to be given for representation also being based on geographic regions of the state. The Board approved the position on S-1481 as recommended by the Task Force on AIDS.

The Reference Committee suggested that the Task Force consider deleting the sentence in the paragraph under (a) HIV Testing, "Testing for AIDS should include documentation as to the need for the test, confidentiality, and pre- and post-counseling," because (1) determination of need is ambiguous; (2) "confidentiality" may create many legal problems and is almost impossible to implement; and (3) there is not clarification as to who does the pre- and post-counseling. The Reference Committee discussed A-1457. The bill requires funeral directors to be notified of death related to AIDS or any communicable disease. The Reference Committee supports the Board's position of no action.

The Reference Committee recommends that the report be filed.

HOUSE ACTION. Not adopted. The report was referred back to the Board of Trustees for further study.

Resolution #14

Introduced by: Burlington County Medical Society
Subject: Emergency Telephone Number—Enhanced #911
Referred to: Reference Committee "E"

Whereas, New Jersey presently has no universal emergency telephone number; and
Whereas, the Enhanced 911 Emergency Number is established and effective in other states;
and

Whereas, the establishment of a universal emergency telephone number in New Jersey is needed and overdue; now therefore be it

Resolved, that the Medical Society of New Jersey seek passage of regulations or legislation to establish the Enhanced 911 Emergency Number system in New Jersey.

The Reference Committee recommends that Resolution #14 be adopted as it is a reaffirmation of existing Society policy.

HOUSE ACTION: Adopted. Resolution #14 was adopted.

Resolution #15

Introduced by: C. Clayton Griffin, MD, and Bartholomew J. Tortella, MTS, MD,
Delegates, Essex County
Subject: Emergency Medical Services System for New Jersey
Referred to: Reference Committee "E"

Whereas, emergency medical services systems, both volunteer and paid professional units, provide valuable medical care in the field and transport to medical facilities; and

Whereas, this sophisticated system largely is unknown to the public, and even some members of the medical community; and

Whereas, there exists a clear need to inform the lay public and the medical community in New Jersey of the emergency medical services system and its role in caring for patients; and

Whereas, many volunteer first-aid squads are unable to provide coverage to their communities 24 hours a day because of a lack of volunteer squad members; and

Whereas, currently there are no existing systems to coordinate emergency medical services on the county, regional, or state level; now therefore be it

Resolved, that the Medical Society of New Jersey support the development of a coordinated emergency medical services system in New Jersey to assist in education, administration, and development of emergency medical services; and be it further

Resolved, that the Medical Society of New Jersey support the recommendations of the Governor's Council on Emergency Medical Services.

The Reference Committee felt that Resolution #15 required further study because the word support in the first resolved was not clearly defined, and the final report of the Governor's Council on Emergency Medical Services has not been released.

The Reference Committee recommends that Resolution #15 be referred to the Board of Trustees for study.

HOUSE ACTION: Adopted. Resolution #15 was referred to the Board of Trustees for study.

Memorial Resolution

Richard I. Nevin, 1908-1987

Whereas, Almighty God has chosen to call from us His loyal servant, Richard I. Nevin, Executive Director Emeritus of the Medical Society of New Jersey; and

Whereas, as Executive Director and as an Honorary Member of the Society, Mr. Nevin served the members of this Society and the people of New Jersey; and

Whereas, his actions demonstrated humanitarian concerns, vision, caring, and true gentleness; and

Whereas, he has left to us a standard of excellence to pursue; now therefore be it

Resolved, that the Medical Society of New Jersey express its profound sorrow at the death of Mr. Nevin, and extend to his beloved wife and family its heartfelt sympathy; and be it further

Resolved, that this Resolution be spread upon the minutes of this meeting, and a copy, suitably prepared, be presented to his bereaved family in heartfelt sympathy.

Received by the House with sorrowful concurrence.

Informational Report

Senior Citizens Task Force

A. RALPH KRISTELLER, MD, CHAIRMAN

The Senior Citizens Task Force continued in its dual purpose of creating a forum which affords an opportunity for the elderly to express to physicians their concerns regarding the delivery of health care, and creating an understanding of how current and proposed regulations impact on the delivery of health care to the elderly.

During the past year, speakers were invited to address the Task Force on a myriad of topics relevant to the delivery of quality health care. Topics and speakers included:

- "Malpractice," Peter Sweetland, President, Medical Inter-Insurance Exchange of New Jersey
- "The Board of Medical Examiners," Frank Malta, MD, President, New Jersey Board of Medical Examiners
- "The Hospital Crisis," Louis P. Scibetta, President, New Jersey Hospital Association
- "Physician Impairment," Edward G. Reading, MDiv, CAC, Assistant Director, Medical Society of New Jersey's Physician's Health Program
- "Medicare Regulations," Joseph J. Czarnecki, Resident Health Insurance Representative, Health Care Financing Administration
- "Economics of Medicine," Howard S. Berliner, ScD, Assistant Commissioner of the Division of Research, Policy, and Planning, New Jersey Department of Health

On October 8, 1987, the Task Force conducted its second annual forum entitled, "Seniors and Physicians: Vitalizing the Relationship." More than 200 attendees heard the keynote speaker, New Jersey State Senator Richard Van Wagner (D), 13th Legislative District, and participated in any one of three workshops: "Improving Access," "Assuring Quality," or "Identifying Costs."

Although the House of Delegates mandated a yearly forum, the Task Force felt that the success of the past two forums warranted an attempt to have two such programs a year. Consequently, a forum entitled, "Quality Health Care: A Guide for Its Retention," was planned for April 6, 1988. Unfortunately, the forum had to be cancelled due to low advanced registration.

The Task Force chose to express its thoughts in letters to the New Jersey Congressional Delegation on two occasions: 1) disapproval of proposed change in procedure for Administrative Law Judge hearing HCFA appeals; and 2) request investigation into sharp increase in denials of Home Health Care Medicare claims. On another occasion, a letter was sent to Governor Kean requesting monetary relief for New Jersey hospitals.

The Task Force meetings and annual forums continue to aim at strengthening mutual trust and understanding between the elderly and physicians.

YOU WILL KNOW THE MOMENT WE KNOW

Good communication with referring physicians is an essential part of our lithotripsy treatment program at the Mid-Atlantic Kidney Stone Center. After the pre-treatment consultation with your patient, we send a full report to you. Post-treatment, we promptly call your office regarding your patient's status. Then we send a complete report to assist you in providing follow-up care. Additionally, we provide each patient with copies of their pre- and

post-treatment x-ray films.

Our medical directors are available for pre- or post-treatment consultation 24 hours a day, 7 days a week. We think you will find that our thorough communications will be of assistance to you during your patient's treatment at the Mid-Atlantic Kidney Stone Center.

In nearly three years of practice as a lithotripsy service, we have

treated more than 3000 patients. Referring physicians from New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware have come to appreciate this unique level of experience as well as our frequent and timely communications. To find out more about our service, or how you can obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337. Outside New Jersey, call (800) 53-LITHO.

For the brain/bowel conflict of IBS*

Specify
Adjunctive

LIBRAX[®]

THE PEACEMAKER.

Antianxiety
Antisecretory
Antispasmodic

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows: "Possibly" effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis. Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur. Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such

as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. After extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

SAFETY

DON'T PLAY DOCTOR WITH YOUR INSURANCE.

Just as you wouldn't want a patient to "play doctor" and self-prescribe too little, too much, or the wrong kind of medicine, we don't want you to play doctor with your insurance.

Protecting your practice, your family, your home and your lifestyle are as important to us as they are to you. As Administrator of these **Medical Society of New Jersey** Endorsed Plans, we're happy to help you with your insurance needs:

**Disability Income, Umbrella Major Medical,
Comprehensive Hospitalization-Major Medical,
Hospital Cash Allowance, and High Limit Accident**

OVER 3500 PATIENTS AND THEIR PHYSICIANS HAVE USED OUR LITHOTRIPTER SERVICE.

In a field where experience is often measured in days or months, the Mid-Atlantic Kidney Stone Center stands apart. With nearly three years of expertise as a lithotripsy service, we have treated more than 3500 kidney stone patients resulting in a high degree of confidence by referring physicians in New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware.

Our concern for the patient's well-being is central to our con-

cept of good patient care. Our professional staff prepares the patients for every aspect of treatment with warmth and understanding. We spend a great deal of time with patients to reassure them and explain the procedure. And patients appreciate the personalized care of the Mid-Atlantic Kidney Stone Center.

Our relationship with referring physicians ensures quality care by providing timely communica-

tions during your patient's treatment. In addition, we are available 24 hours a day for pre- and post-treatment consultation. We believe this cooperation between the referring urologist and the staff at Mid-Atlantic is essential to effective treatment and recovery. To find out more about our service, or to obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337 or (800) 53-LITHO.

HANDS ON INVESTMENT

U.S. rare coins let you hold your financial future in the palm of your hand. They preserve wealth through good times and bad, providing a safe harbor for portfolio protection. And their competitive performance outshines other investments, with an average annual return of 16.77 percent in the last ten years.*

Many physicians have seen the benefits of a diversified rare coin portfolio. Numismatic Management Corporation provides only high-quality coins for investment-conscious professionals. Each coin is graded independently by the Numismatic Guaranty Corporation of America and comes with certification of authenticity by the Professional Numismatists Guild to assure the buyer of its fair and proper value.

For more information, contact Mary Anne Schafer, or Tom Kurtz at (201)-906-3636.

YOCON® YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

INTRODUCING **MEMO PAGER**

THE BEEPER THAT ALLOWS YOU TO DIAGNOSE YOUR MESSAGES!

When time is important, you want to know if your messages demand immediate action, or can wait while you attend to more pressing matters.

Now, MEMO PAGER, the Beeper that displays a **written** message, allows you to determine instantly if that message is an emergency.

That can not only save time, it could even save lives.

Designed for physicians, hospitals and health-related organizations, MEMO PAGER can be an indispensable link between doctors, nurses, and other staff personnel.

Here are some of the advantages you have with MEMO PAGER :

- Receive written messages from hospital and staff, wherever you may be.
- Receive confidential medical information at any time.
- Eliminate "telephone tag" by getting a full written message instead of just a phone number.
- Receive up to 1,950 characters, including code letters.
- Store up to sixteen written messages for later review.
- Signal when battery is low.

Get your MEMO PAGER from Radio Call Co. and get 10,000 SQUARE MILES OF COVERAGE in the metro New York area (including Montauk LI, Fairfield CT, Rockland, Westchester and Northern NJ).

MEMO PAGER — Just **\$38.50** per month (lower prices in quantity)
FREE Computer Terminal with Keyboard and Modem when you order six or more!

Call for the office nearest you.

LEVOXINE®

(LEVOTHYROXINE SODIUM TABLETS, USP)

FOR ORAL ADMINISTRATION

DESCRIPTION:

Each LEVOXINE (Levothyroxine Sodium, USP) tablet contains synthetic crystalline levothyroxine sodium (L-thyroxine). L-thyroxine is the principal hormone secreted by the normal thyroid gland. Chemically, L-thyroxine is designated as L-tyrosine, O-(4-hydroxy-3, 5-diiodophenyl) - 3,5-diiodo-, monosodium salt, hydrate. The molecular formula is $C_{15}H_{10}I_2N_2NaO_4$ and the structural formula is:

CLINICAL PHARMACOLOGY:

The principal effect of thyroid hormones is to increase the metabolic rate of body tissues.

The thyroid hormones are also concerned with growth and development of tissues in the young.

The major thyroid hormones are L-thyroxine (T_4) and L-triiodothyronine (T_3). The amounts of T_4 and T_3 released from the normally functioning thyroid gland are regulated by the amount of thyrotropin (TSH) secreted from the anterior pituitary gland. T_4 is the major component of normal thyroid gland excretions and is therefore the primary determinant of normal thyroid functions. T_4 acts as a substrate for physiologic deiodination to T_3 in the peripheral tissues. The physiologic effects of thyroid hormones are mediated at the cellular level primarily by T_3 .

LEVOXINE (L-thyroxine) tablets taken orally provide T_4 which upon absorption can not be distinguished from T_4 that is secreted endogenously.

INDICATIONS AND USAGE:

LEVOXINE (L-thyroxine) tablets are indicated as replacement or supplemental therapy for diminished or absent thyroid function (e.g., cretinism, myxedema, nontoxic goiter or hypothyroidism generally, including the hypothyroid state in children, in pregnancy and in the elderly) resulting from functional deficiency, primary atrophy, from partial or complete absence of the gland or from the effects of surgery, radiation or antithyroid agents. Therapy must be maintained continuously to control the symptoms of hypothyroidism.

CONTRAINDICATIONS:

L-thyroxine therapy is contraindicated in thyrotoxicosis, acute myocardial infarction and uncorrected adrenal insufficiency.

WARNINGS:

Drugs with thyroid hormone activity, alone or together with other therapeutic agents, have been used for the treatment of obesity. In euthyroid patients, doses within the range of daily hormonal requirements are ineffective for weight reduction. Larger doses may produce serious or even life-threatening manifestations of toxicity, particularly when given in association with sympathomimetic amines such as those used for their anorectic effects.

PRECAUTIONS:

General — Caution must be exercised in the administration of this drug to patients with cardiovascular disease. Development of chest pains or other aggravation of the cardiovascular disease requires a reduction of dosage.

LEVOXINE (L-thyroxine) 100 mcg (0.1 mg), 200 mcg (0.2 mg) and 300 mcg (0.3 mg) tablets contain FD & C Yellow No. 5 (tartrazine) which may cause allergic-type reactions (including bronchial asthma) in certain susceptible individuals. Although the overall incidence of FD & C Yellow No. 5 (tartrazine) sensitivity in the general population is low, it is frequently seen in patients who also have aspirin hypersensitivity.

Information For The Patient — Patients on thyroid preparations and parents of children on thyroid therapy should be informed that:

1. Replacement therapy is to be taken essentially for life, with the exception of cases of transient hypothyroidism, usually associated with thyroiditis, and in those patients receiving a therapeutic trial of the drug.
2. They should immediately report during the course of therapy any signs or symptoms of thyroid hormone toxicity, e.g., chest pain, increased pulse rate, palpitations, excessive sweating, heat intolerance, nervousness, or any other unusual event.
3. In case of concomitant diabetes mellitus, the daily dosage of antidiabetic medication may need readjustment as thyroid hormone replacement is achieved. If thyroid medication is stopped, a downward readjustment of the dosage of insulin or oral hypoglycemic agent may be necessary to avoid hypoglycemia. At all times, close monitoring of urinary glucose levels is mandatory in such patients.

4. In case of concomitant oral anticoagulant therapy, the prothrombin time should be measured frequently to determine if the dosage of oral anticoagulants is to be readjusted.

5. Partial loss of hair may be experienced by children in the first few months of thyroid therapy, but this is usually a transient phenomenon and later recovery is usually the rule.

Laboratory Tests — The patient's response to thyroid replacement may be followed by laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels.

Drug Interactions — In patients with diabetes mellitus, addition of thyroid hormone therapy may cause an increase in the required dosage of insulin or oral hypoglycemic agents. Therefore, patients with diabetes mellitus should be observed closely for possible changes in antidiabetic drug dosage requirements.

Patients stabilized on oral anticoagulants who are found to require thyroid replacement therapy should be watched very closely when therapy is started. If a patient is truly hypothyroid, it is likely that a reduction in anticoagulant dosage will be required. No special precautions appear to be necessary when oral anticoagulant therapy is begun in a patient already stabilized on maintenance thyroid replacement therapy.

Cholestyramine binds both T_4 and T_3 in the intestine, thus impairing absorption of these thyroid hormones. In vitro studies indicate that the binding is not easily removed. Therefore, four to five hours should elapse between administration of cholestyramine and thyroid hormones.

Estrogens tend to increase serum thyroxine-binding globulin (TBG). In a patient with a non-functioning thyroid gland who is receiving thyroid replacement therapy, free thyroxine may be decreased when estrogens are started thus increasing thyroid requirements. However, if the patient's thyroid gland has sufficient function the decreased free thyroxine will result in a compensatory increase in thyroxine output by the thyroid. Therefore, patients without a functioning thyroid gland who are on thyroid replacement therapy may need to increase their thyroid dose if estrogens or estrogen containing oral contraceptives are given.

Drug/Laboratory Test Interactions — The following drugs or moieties are known to interfere with laboratory tests performed on patients taking thyroid hormone: androgens, corticosteroids, estrogens, oral contraceptives containing estrogens, iodine-containing preparations, and the numerous preparations containing salicylates.

1. Changes in TBG concentration should be taken into consideration in the interpretation of T_4 and T_3 values. In such cases, the unbound (free) hormone should be measured. Pregnancy, estrogens, and estrogen-containing oral contraceptives increase TBG concentrations. TBG may also be increased during infectious hepatitis. Decreases in TBG concentrations are observed in nephrosis, acromegaly, and after androgen or corticosteroid therapy. Familial hyper- or hypo-thyroxine-binding-globulinemias have been described. The incidence of TBG deficiency approximates 1 in 9000. The binding of thyroxine by thyroid-binding prealbumin (TBPA) is inhibited by salicylates.

2. Medical or dietary iodine interferes with all in vivo tests of radio-iodine uptake, producing low uptakes which may not be reflective of a true decrease in hormone synthesis.

3. The persistence of clinical and laboratory evidence of hypothyroidism in spite of adequate dosage replacement indicates either poor patient compliance, poor absorption, excessive fecal loss, or inactivity of the preparation. Intracellular resistance to thyroid hormone is quite rare.

Carcinogenesis, Mutagenesis, And Impairment Of Fertility

Of Fertility — A reportedly apparent association between prolonged thyroid therapy and breast cancer has not been confirmed and patients on thyroid for established indications should not discontinue therapy. No confirmatory long-term studies in animals have been performed to evaluate carcinogenic potential, mutagenicity, or impairment of fertility in either males or females.

Pregnancy — Category A — Thyroid hormones do not readily cross the placental barrier. The clinical experience to date does not indicate any adverse effect on fetuses when thyroid hormones are administered to pregnant women. On the basis of current knowledge, thyroid replacement therapy to hypothyroid women should not be discontinued during pregnancy.

Nursing Mothers — Minimal amounts of thyroid hormones are excreted in human milk. Thyroid is not associated with serious adverse reactions and does not have a known tumorigenic potential. However, caution should be exercised when thyroid is administered to a nursing woman.

Pediatric Use — Pregnant mothers provide little or no thyroid hormone to the fetus. The incidence of congenital hypothyroidism is relatively high (1:4,000) and the hypothyroid fetus would not derive any benefit from the small amounts of hormone crossing the placental barrier. Routine determinations of serum (T_4) and/or TSH is strongly advised in neonates in view of the deleterious effects of thyroid deficiency on growth and development.

Treatment should be initiated immediately upon diagnosis and maintained for life, unless transient hypothyroidism is suspected; in which case, therapy may be interrupted for 2 to 8 weeks after the age of 3 years to reassess the condition. Cessation of therapy is justified in patients who have maintained a normal TSH during those 2 to 8 weeks.

ADVERSE REACTIONS:

Adverse reactions are due to overdosage and are those of induced hyperthyroidism.

OVERDOSAGE — Excessive dosage of thyroid medication may result in symptoms of hyperthyroidism. Since, however, effects do not appear at once, the symptoms may not appear one to three weeks after the dosage regimen is begun. The most common signs and symptoms of overdosage are weight loss, palpitation, nervousness, diarrhea or abdominal cramps, sweating, tachycardia, cardiac arrhythmias, angina pectoris, tremor, headache, insomnia, intolerance to heat and fever. If symptoms of overdosage appear, discontinue medication for several days and reinstitute treatment at a lower dosage level.

Laboratory tests such as serum T_4 , serum T_3 and the triiodothyronine index will be elevated during the period of overdosage.

Complications as a result of the induced hypermetabolic state may include cardiac failure and death due to arrhythmia or failure.

TREATMENT OF OVERDOSAGE — Dosage should be reduced or therapy temporarily discontinued if signs or symptoms of overdosage appear. Treatment may be reinstituted at a lower dosage. In normal individuals, normal hypothalamic-pituitary-thyroid axis function is restored in 6 to 8 weeks after thyroid suppression.

Treatment of acute massive thyroid hormone overdosage aimed at reducing gastrointestinal absorption of the drugs a counteracting central and peripheral effects, mainly those increased sympathetic activity. Vomiting may be induced initially further gastrointestinal absorption can reasonably be prevented and barring contraindications such as coma, convulsions, loss of the gagging reflex. Treatment is symptomatic and supportive. Oxygen may be administered and ventilation maintained. Cardiac glycosides may be indicated if congestive heart failure develops. Measures to control fever, hypoglycemia, or fluid loss should be instituted if needed. Antiadrenergic agents, particularly propranolol, have been used advantageously in the treatment increased sympathetic activity. Propranolol may be administered intravenously at a dosage of 1 to 3 mg over a 10 minute period orally, 60 to 160 mg/day, especially when no contraindications exist for its use.

DOSAGE AND ADMINISTRATION:

The goal of therapy should be the restoration of euthyroidism judged by clinical response and confirmed by appropriate laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels. The age and general condition of the patient and severity and duration of hypothyroid symptoms determine starting dosage and the rate of incremental dosage increase leading to a final maintenance dosage.

In otherwise healthy adults, the recommended initial dose is 25 to 100 mcg (0.025 to 0.1 mg) daily, while the predicted maintenance dose of 100 to 200 mcg (0.1 to 0.2 mg) daily may be achieved in two to three weeks.

In the elderly patient with long standing disease, evidence of myxedema, or evidence of cardiovascular dysfunction, the initial dose may be as little as 25 mcg (0.025 mg) per day. Incremental increases of 25 mcg (0.025 mg) per day at 3 to 4 week intervals may be instituted depending on patient response. It is physician's judgement of the severity of the disease and observation of patient response which determine the rate of dosage increase.

In infants and children there is a great urgency to achieve thyroid replacement because of the critical importance of thyroid hormone in sustaining growth and maturation. Despite smaller body size, the dosage needed to sustain a full rate of growth, development and general thriving is higher in the child than in the adult. The recommended daily replacement dosage of L-thyroxine in childhood is: 0-1 years: 9 mcg/kg; 1-5 years: 6 mcg/kg; 6-10 years: 4 mcg/kg; 11-20 years: 3 mcg/kg daily.

DOSAGE FORMS AVAILABLE:

LEVOXINE (L-thyroxine) tablets are supplied as oval, coded, potency marked tablets in 9 strengths: 25mcg (0.025 mg)—orange, 50 mcg (0.05 mg)—white, 75 mcg (0.075 mg)—purple, 100 mcg (0.1 mg)—yellow, 125 mcg (0.125 mg)—brown, 150 mcg (0.15 mg)—blue, 175 mcg (0.175 mg)—turquoise, 200 mcg (0.2 mg)—pink and 300 mcg (0.3 mg)—green, in bottles of 100, 1000, and unit dose.

Levoxine[®]

(Levothyroxine Sodium Tablets, USP)

**Finally, a bioequivalent replacement
for Synthroid[®]
that's reasonably priced.**

* New Jersey Register March 21, 1988 (cite 20 N.J.R. 655)

Introducing Levoxine from Daniels Pharmaceuticals – a breakthrough in quality manufactured Levothyroxine Sodium Tablets, USP, now available at reasonable costs.

Randomized crossover studies comparing the bioequivalency of Levoxine tablets to Synthroid tablets showed no significant difference in thyroxine (T₄), triiodothyronine (T₃) or free thyroxine index (T₇).

Levoxine is available in nine color-coded strengths to assure prescription compliance and patient acceptance. And each strength is put through extensive quality control measures that exceed required USP testing. Prescribe Levoxine, and give your patients exactly what they need at a price that's more affordable.

MEDICAL SOCIETY OF NEW JERSEY

Sports Medicine 1988

The Medical Society of New Jersey is sponsoring "Sports Medicine '88" on October 5, 1988, at Society headquarters, Two Princess Road, Lawrenceville, NJ. The program is open to physicians, school administration, athletic directors, coaches, nurses, trainers, and students. The program begins at 8:30 A.M. and includes: Indications and Limitations of Arthroscopy by Gary J. Savatsky, M.D.; Senior Athlete and Osteoporosis by Christine E. Haycock, M.D.; Liability of Sports Medicine by Steven I. Kern, Esq.; Back Problems of the Athlete by Martin Scott, D.O.; and a panel discussion. The program will conclude at 1:15 P.M. Deadline for registration is September 23, 1988; fees are: physicians: \$25; other personnel: \$20; and students: \$5.

MEDICAL SOCIETY OF NEW JERSEY

Peer Review, Utilization Review, and Quality Review Are the Practice of Medicine

The following letter was sent to Dr. Formica from Dr. Frank J. Malta, President of the State Board of Medical Examiners (SBME), dated May 26, 1988:

I am in receipt of your letter of May 19, 1988, which expresses the concern of the House of Delegates of the Medical Society of New Jersey in that third-party payors be held accountable to the same standards as are plenary licensed physicians.

Please note that SBME has taken the position that peer review activity which encompasses all of the components of decision making into the appropriateness of patient care requires a current plenary license. Therefore, peer review activity involves the practice of medicine. It would not be appropriate for third-party payors to be denied care based on cost consideration alone. Rather, care should be rendered based on the necessity of care in accordance with acceptable standard of practice. Therefore, the Board's position is that the final determination for the appropriateness of care is by physician and not by a nonphysician reviewer.

This Board has articulated that position in the past, noting that medical experts and those participating in peer review activities who fail to meet the standard of acceptable practice could be found guilty of professional misconduct and thereby sub-

ject to disciplinary action under the Medical Practice Act.

This Board has the responsibility by mandate of the Legislature to protect the health, safety, and welfare of the public. It is charged with the responsibility of investigating complaints from all arenas. It is apparent that concerns expressed by the Medical Society's House of Delegates were prompted by improper conduct by third-party payors or independent reviewers. The Board recommends that letters of complaint be filed with the Board for appropriate and expeditious investigation.

LEUKEMIA SOCIETY OF AMERICA

Grant Applications

The Leukemia Society of America is accepting applications for 1989 grants in basic science and clinical level research of leukemia and related diseases. Three awards are being offered: scholar grants totaling \$200,000 for five years to researchers with five years or more experience who have demonstrated their ability to conduct original investigations; special fellow grants totaling \$87,000 for three years for researchers in the intermediate stages of career development; and fellow grants of \$70,500 for three years for promising investigators with minimum or no prior experience. A Ph.D., M.D., or equivalent degree is required of all candidates.

Awards are not given to individuals who are receiving full institutional salary support.

The deadline for applications is September 1. Only one application in each grant category may be submitted from each faculty sponsor. Proposals for all categories of grants will be evaluated on a competitive basis by the Leukemia Society's Grant Review Subcommittee in late January 1989. Applicants should use only the most current forms to apply for grants. Funding for all grantees begins on July 1, 1989. For application forms and additional information, write to: Research Grant Coordinator, Leukemia Society of America, 733 Third Avenue, New York, NY 10017.

MEDICAL SOCIETY OF NEW JERSEY

Tort Reform: S-263; S-1845

On June 23, 1988, the Senate Judiciary Committee tabled consideration of the Statute of Limitations bill.

Major opponents of that bill were Senators Ambrosio, O'Connor, and Zane.

The Committee did vote to release S-1845, the periodic payments bill. Those voting in favor were Senators Codey, VanWagner, Orechio, Laskin, Lynch, and DiFrancesco. They all should receive messages of thank you from doctors.

We will be reconsidering our position and format on the statute of limitations later. There are certain concerns that must be accommodated. You will be advised later in this regard.

MEDICAL SOCIETY OF NEW JERSEY

Darkfield Services—Sexually Transmitted Diseases

This letter was received by Dr. Formica from Dr. Molly Joel Coye, New Jersey State Commissioner of Health, on May 24, 1988:

For many years, our sexually transmitted disease (STD) program staff were the sole providers of this diagnostic procedure for early lesion syphilis. Our staff would transport these microscopes in their cars and respond to service calls 24 hours a day, seven days a week. As you know, the field of sexually transmitted diseases has expanded tremendously from the time this policy was instituted. Today, there are more than 20 diseases and several syndromes that are contracted through sexual exposure.

In view of the need to address increasing numbers of cases, as well as additional diseases, we were forced to limit the amount of time our professional outreach staff was spending delivering these services. In 1986, we made a decision to schedule the availability of darkfield services provided by our staff only through large metropolitan STD clinics. In addition, we developed a darkfield microscopy training course which is offered by our Clinical Laboratory Improvement Services staff.

Physicians in private practice can access these services by calling their local health department or our STD program at 609/588-7526. I hope this information is helpful in clearing up any confusion concerning our darkfield microscopic services policy. Should you require additional information, please contact Mr. Clifford G. Freund of our STD Program at 609/588-7526.

MEDICAL SOCIETY OF NEW JERSEY

Right To Bill for Information

With the current emphasis on managed care in its various forms, the practicing physician receives numerous calls regarding preadmission certification, continued stay, discharge planning, disability evaluation, the prognosis, and other questions about a given patient. These calls are disruptive, annoying, and time consuming; they place a demand upon the physician which is not generally contemplated in the doctor's fee.

The House of Delegates adopted a resolution in April 1988, that recognized the right of physicians to bill for those information services required by third parties which go beyond those necessary to complete a health insurance claim form. We have articulated the sense of that resolution to the Commissioner of Labor and the Commissioner of Insurance.

MEDICAL SOCIETY OF NEW JERSEY

Letter to Commissioners Serraino and Merin

The following letter was sent to Commissioner Charles Serraino, New Jersey State Department of Labor, and Commissioner Kenneth D. Merin, New Jersey State Department of Insurance, signed by MSNJ Secretary Bernard Robins, M.D.:

Practicing physicians treating patients covered under disability plans, workers' compensation, health, auto, and general accident insurance are consistently being asked to write evaluations, reports, supply information, give status reports, and to update carriers or their agents as to treatment plans and the prognosis for the patient.

These requests are burdensome to the physician, and time consuming. They are not part of the physician's routine service, and are clearly not within the expressed intent and simple meaning of the statute which requires physicians to complete health insurance claim forms without additional charge to the patient.

The Board of Trustees believes that these requests are indeed additional matters, for which the physician is entitled to reasonable compensation.

We are advising our members, as well as you, of this position.

Thank you for understanding.

AMA-HOSPITAL MEDICAL STAFF SECTION

Dr. Weierman Is Elected

The Medical Society of New Jersey is proud to announce that Robert J. Weierman, M.D., has been elected to the American Medical Association-Hospital Medical Staff Section (AMA-HMSS) Governing Council. Dr. Weierman is an orthopaedic surgeon and a member of our Essex County Medical Society.

Dr. Weierman is an active participant at the HMSS Assembly and reference committee sessions, serving as reference committee chairman in 1986. In addition, he was a co-organizer of the New Jersey section and is immediate past-chairman of the AMA-HMSS-MSNJ and an alternate delegate to the AMA House of Delegates.

Born in 1942, Dr. Weierman received an undergraduate degree from St. Peter's College, Jersey City, and a medical degree from Georgetown University, Washington, D.C. He completed his internship and first-year surgical residency at Jersey Shore Medical Center, Neptune and an orthopaedic residency at UMDNJ. Presently, Dr. Weierman is attending at Hospital Center at Orange and Irvington General Hospital and an assistant attending at St. Mary's Hospital, Orange, and Saint Barnabas, Livingston; he is a clinical associate professor of orthopaedic surgery at UMDNJ-Newark. Dr. Weierman is a member of the American Medical Association and of the Academy of Medicine, a diplomate of the American Board of Orthopaedic Surgery, and a fellow of the American College of Orthopaedic Surgeons.

We congratulate Dr. Weierman.

MSNJ CONGRATULATIONS

Bernard Miller, M.D.

Congratulations to Bernard Miller, M.D., of New Brunswick who recently retired. Untold thousands of

patients have received benefits from a special DE-BOCA—"Deductible Entry in the Book of Charity Project." Dr. Miller provided not only medical service but drugs, food, fuel, and money to needy patients. What an example for all of us.

AMA ADVISERS, INC.

The Importance of Being Tax-Exempt

The Tax Reform Act of 1986 spawned what seems like a swarm of complications, exceptions, and special considerations. And, to the dismay of many taxpayers, it did not lower their tax bill in 1987. Against this backdrop of fewer tax shelters and higher taxes, it makes sense for most individuals to re-evaluate their investment portfolio with the goal of reducing their overall tax liability. After all, when you invest, it is not what you earn that counts, it is what you keep.

One of the best ways to achieve this investment goal is through investing in municipal bonds, which offer income free from federal, and in many cases, state and local income taxes.

How can you tell if you are a candidate for tax-free income? If the return from a tax-free investment delivers more spendable dollars than a comparable quality taxable investment, municipal bonds may be for you.

At what level of income does this occur? In the 28 percent marginal tax bracket, starting at about \$30,000, for a couple filing jointly. The higher the tax bracket, the more attractive the tax-free return.

To compare tax-free securities with other taxable fixed-income investments, it is necessary to determine the taxable equivalent yield. This is the yield an investor would have to earn on a taxable investment to equal what could be earned from a tax-free investment. Most brokers that deal with tax-free investments will be able to advise you on current tax-free yields and their equivalent taxable yield.

Although it sounds easy enough, the problem is that most investors neither have the time nor the expertise to select and monitor the most attractive and credit-worthy issues of municipal bonds. Fortunately, there are tax-free investment vehicles that eliminate these problems for the individual investor.

One of these is the Unit Investment Trust (UIT). The UIT is a fixed portfolio of professionally selected municipal bonds that offers customers income that is exempt from federal and, sometimes, state taxes. Many investors choose UITs because they prefer to know in advance exactly which securities will be held in the trust and what interest yield to expect.

A UIT offers investors these distinct advantages:

Professional Selection and Surveillance. Professionals select and monitor the trust until the last bond is called or sold or matures.

Payment Options. Investors can receive interest dis-

tributions monthly, quarterly, or semiannually, to meet their cashflow needs.

Optional Insurance. Some UITs are insured for guaranteed timely payment of principal and interest.

Convenience. All administrative work is done for you.

Liquidity. Units in a UIT always are redeemable at net asset value based on the market prices of the portfolio's underlying bonds, which may be more or less than the original purchase price, depending on interest rates at the time of purchase and redemption.

Diversification. UIT investment professionals select and monitor portfolios of bonds diversified by type, geographic location, revenue source, and purpose, which allows the investor to invest in a wide range of bonds, saving time and effort of making individual selections and reducing investment exposure to risk.

When an investor owns a portion of a UIT, units in that trust are owned. These units represent the investor's pro-rata share of the value of that trust. Unit investment trusts are sold in minimum investments ranging from \$1,000 to \$5,000. Investors pay a one-time sales charge, which varies depending on the amount invested. Also, there is no annual management fee, and no charge for redemption.

Unit trusts come in varying shapes and sizes. There are national portfolios and state portfolios, insured and uninsured trusts, and long, intermediate, and short-term maturities. There is something for almost every investment need.

Because of the UIT's steady stream of tax-free income, many investors use it as a monthly cash flow supplement. However, the UIT is a versatile investment vehicle that is well suited for various financial planning strategies—funding monthly mortgage payments or semiannual insurance premiums, for example.

A UIT also is appropriate for long-term savings plans—for retirement or college tuition—whereby the income from the trust is reinvested into a tax-free mutual or money market fund. This way, investors enjoy the benefits of compounding interest tax-free. For example, John Nuveen & Co. Incorporated, the largest sole sponsor/underwriter of unit investment trusts, offers a number of reinvestment options. Interest can be directed into national and state mutual and money market funds, where it continues to grow tax-free.

For the investor who is looking to reduce overall tax liability, build savings, or supplement income, a tax-exempt UIT is a wise investment choice which can be tailored to meet one's particular financial needs.

PUBLIC AFFAIRS UPDATE

CLARK MARTIN*

***Malpractice Reform Gains Strength;
Medicaid Fees: A Small Step Forward;
Auto Insurance Reform Fizzles***

MALPRACTICE REFORM GAINS STRENGTH

Structured verdicts, a major element of the Society's push to reform medical malpractice laws, is a step closer to reality following the June 23 release of S-1845 from the Senate Judiciary Committee.

The bill, sponsored by Senator Raymond Lesniak (D-Elizabeth), would bring cost containment to medical malpractice cases. It would require judgments for future damages in excess of \$250,000 to be paid in installments over time, rather than as a lump sum. Past damages, such as lost income and medical expenses, still would be paid at settlement.

Significantly, the bill also provides that periodic payments for the plaintiff's health care costs and non-economic loss (pain and suffering) would cease if the plaintiff dies.

If enacted, S-1845 could bring a reduction in malpractice insurance premiums of 8 to 10 percent, according to the Medical Inter-Insurance Exchange of New Jersey (MIENJ).

Hundreds of physicians took part in a telephone and letter-writing campaign prior to the committee vote. Their efforts were made all the more significant by the bill's receiving just six favorable votes, exactly the number needed to be released from committee. Without the involvement of the physicians who participated in the lobbying campaign, it's likely that the bill would not have been voted out of committee. Even with the campaign, a second tort reform measure, which would have imposed a three-year statute of limitations on malpractice actions, was held in committee due to insufficient support.

Senators who voted in favor of S-1845 were Richard

J. Codey (D-West Orange), Donald DiFrancesco (R-Scotch Plains), Lee B. Laskin (R-Cherry Hill), John A. Lynch (D-New Brunswick), Carmen A. Orechio (D-Nutley), and Richard VanWagner (D-Red Bank).

Voting against the bill were Senators Gabriel M. Ambrosio (D-Lyndhurst), Edward T. O'Connor (D-Jersey City), and Raymond J. Zane (D-Woodbury), and abstaining were John H. Dorsey (R-Mountain Lakes) and William L. Gormley (R-Atlantic City).

Much more work lies ahead in order to secure passage of the bill in the Senate. MIENJ and the Society are working to have it posted for a vote in the fall session. The Bar Association and two powerful lawyer lobbies, LEGAL and ATLA, are vigorously opposing the measure.

MEDICAID FEES: A SMALL STEP FORWARD

New Jersey's fiscal 1989 budget, which took effect on July 1, contains an \$11.2 million increase in Medicaid fees for individual providers—the first such increase in 15 years.

While this falls short of what the Society had hoped for, at least it is a start. Governor Kean and Human Services Commissioner Drew Altman both are aware that too few physicians and other providers participate in the program. As a result, the majority of Medicaid patients can receive primary care only in costly hospital outpatient facilities and emergency rooms.

How far will the \$11.2 million go? We'll know soon. Altman told the Society's Medicaid Committee that his first goal is to raise the current \$7 office rate for primary care to \$13 to \$15. In order to achieve that level, it appears certain that revenues will have to be transferred from Medicaid's hospital account to individual providers.

Language in the budget requires Human Services to submit a new provider fee schedule to the Senate Revenue and Assembly Appropriations Committees. This information should help the Society's efforts to gain a more generous increase in next year's budget.

AUTO INSURANCE REFORM FIZZLES

Much like the Tyson-Spinks heavyweight fight, the first round of the Senate-Assembly bout to revamp the no-fault auto insurance law didn't last long. In the space of two weeks, each house had passed its own plan and rejected the other's.

However, in the seemingly endless battle over how to remold the law in order to reduce premiums, one point of agreement seems to have emerged: a medical fee schedule.

Both houses have passed bills which would apply a fee schedule to Personal Injury Protection (PIP) coverage, the portion of an auto policy which pays an injured driver's hospital and physician bills. The fee schedule currently under consideration would be based on Blue Shield. The legislation would permit balance billing.

The PIP fee schedule would be enacted only as part of an overall reform measure dealing with the question of when an injured party can sue a negligent driver for pain and suffering. At this writing, the Senate and Assembly are miles apart on that issue. Stay tuned.

*Mr. Martin is MSNJ's legislative consultant.

Carafate[®] for the ulcer-prone NSAID user

Aspirin and other nonsteroidal anti-inflammatory drugs  are known to weaken mucosal defenses by inhibiting prostaglandin production. As a result, NSAID users may be more prone to duodenal ulcers.¹ For these patients, CARAFATE[®] (sucralfate/Marion) is first-line therapy that won't knuckle  under. Carafate rebuilds mucosal defenses, including endogenous prostaglandins, through a unique, nonsystemic mode of action. Carafate works by enhancing the body's natural healing ability while it protects damaged mucosa  from further injury. Carafate offers a local healing approach to a local problem, allowing patients to continue their NSAID therapy. So the next time you see an arthritis patient with a duodenal ulcer, prescribe nonsystemic Carafate:  therapy for the ulcer-prone patient.

Nothing works like

CARAFATE[®]
sucralfate/Marion

Please see brief summary of prescribing information and reference on adjacent page.

1337E8

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that simultaneous administration of CARAFATE (sucralfate) with tetracycline, phenytoin, digoxin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The clinical significance of these animal studies is yet to be defined. However, because of the potential of CARAFATE to alter the absorption of some drugs from the gastrointestinal tract, the separate administration of CARAFATE from that of other agents should be considered when alterations in bioavailability are felt to be critical for concomitantly administered drugs.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Chronic oral toxicity studies of 24 months' duration were conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). There was no evidence of drug-related tumorigenicity. A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies were not conducted.

Pregnancy: Teratogenic effects. Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients treated with sucralfate, adverse effects were reported in 121 (4.7%).

Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

OVERDOSAGE

There is no experience in humans with overdosage. Acute oral toxicity studies in animals, however, using doses up to 12 gm/kg body weight, could not find a lethal dose. Risks associated with overdosage should, therefore, be minimal.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm tablets are supplied in bottles of 100 (NDC 0088-1712-47) and in Unit Dose Identification Paks of 100 (NDC 0088-1712-49). Light pink scored oblong tablets are embossed with CARAFATE on one side and 1712 bracketed by C's on the other.

New Informed Consent Supreme Court Decision; Beware of Hospital Corridor Prescribing; Past Malpractice May Be Kept from Uncle Sam's Eyes; Plan for Bringing Down Liability Costs

NEW JERSEY'S NEW "INFORMED CONSENT" SUPREME COURT DECISION

A patient who underwent a biopsy of the breast and excision of lymph nodes for suspected breast cancer developed lymphedema of the right arm and hand. The surgeon who performed the biopsy allegedly did not advise the patient of the risk of lymphedema. At trial, an expert witness for the plaintiff told the jury that the surgeon should have told the patient about this risk. The expert witness who testified on behalf of the physician told the jury that physicians consider the risk to be "too remote" a phenomenon to be discussed with their patients.

The jury found no liability on the part of the surgeon. The plaintiff and her husband appealed, arguing that the trial court erred in instructing the jury on the standard by which they must judge whether or not the patient's consent was an informed one. The appeal was ultimately decided by the Supreme Court of New Jersey on May 8, 1988. The high court's decision changes the law of informed consent in New Jersey. The changes affect the scope of what the physician must disclose, and will change the way cases of informed consent are presented to juries at trial.

The legal duty of a physician to obtain the informed consent of his patient has been a part of medical malpractice jurisprudence in New Jersey for two decades. In 1968, the Supreme Court of New Jersey affirmed the opinion of the Appellate Division in a case known as Kaplan versus Haines, 51 N.J. 404, aff'g 96 N.J. Super 242. In the Kaplan case, the court adopted

a standard of disclosure for informed consent that required the physician to disclose those risks that a reasonable physician in the community and of like training would customarily disclose in similar circumstances. This standard became known as the "professional" standard, since the scope of disclosure was clearly dependent upon physician custom and practice.

Breaking with the past, the Supreme Court of New Jersey rejected the "professional standard" in informed consent cases. In the case known as Largey versus Rothman, the high court characterized the "professional standard" as "anachronistic paternalism" at odds with the concept of a patient's right to self-determination. Instead, it adopted what is known as a "prudent patient" rule for disclosure. The "prudent patient" rule was first formulated in 1972 by a federal court in a case known as Canterbury versus Spence, 464, F.2d 772 (D.C., Civ.), cert. den. 409 U.S. 1064.

Under the law now adopted by New Jersey's highest court, physicians in the state no longer can rely solely upon the custom and practice of their profession in determining what risks or alternative treatment should be disclosed to patients. Rather, disclosure now must be measured by the patient's need to know of risks that are "material."

The law requires a physician "to warn of the dangers of proposed therapy" and to convey "information which the patient has every right to expect." The law also imposes a duty to make "reasonable disclosure of choices" with respect to treatment and "the dangers inherently and potentially involved." The new rule defines a "material" risk as one which a reasonable patient, in what the physician knows or should know to be a patient's position, would likely attach significance to in deciding whether to accept or forgo proposed therapy.

The new decision of the Supreme Court of New Jersey makes it easier and less expensive for a patient to bring a lawsuit alleging lack of informed consent. Under the former "professional standard," the patient was required to retain an expert witness who would testify at trial that the defendant physician failed to disclose what reasonable physicians of like training in the community would have told the patient under similar circumstances. The new "prudent patient" rule abolishes the requirement for the patient turned plaintiff to present expert testimony on informed consent. Nevertheless, nothing in the court's opinion is likely to prevent either the plaintiff or the defendant physician from presenting expert witness testimony. Experts may identify risks and characterize them as to their medical significance and degree of remoteness. Experts also may give testimony regarding patient concerns about particular risks.

Juries deciding informed consent cases in New Jersey must not only determine whether the plaintiff has proved that the physician failed to comply with the new standard for disclosure, but also whether or not such failure was the proximate cause of the plaintiff's

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department and Director of Special Projects, respectively.

injuries. The jury will be asked to decide whether or not a prudent person in the plaintiff's position would have submitted to treatment if suitably informed of all perils bearing significance. If the jury determines that adequate disclosure could reasonably be expected to have caused that person to decline the treatment because of the kind of risk or danger that resulted in harm, then causation is shown.

In essence, juries will be asked to assess the "reasonableness" of a plaintiff's testimony that he would have refused the treatment had the risk been disclosed. The law requires that a patient must be informed of his problem in terms understandable to him. The patient must also be told what treatment is proposed, and what the inherent risks and benefits are regarding the proposed treatment. Any alternative treatments and associated risks and benefits must also be discussed. The patient should be told the prognosis if no treatment is undertaken. Patients should be encouraged to ask questions so that the physician may determine what risks are "material" to the patient's decision.

The new decision of the Supreme Court of New Jersey requires disclosure of those risks or complications likely enough to happen so that a reasonable patient in similar circumstances might refuse the proposed treatment or seek alternative treatment. A patient who sues a physician for lack of informed consent no longer will be required to retain an expert witness to testify at trial. (Madelyn S. Quattrone, J.D., George & Korin, P.A., Woodbury, NJ)

BEWARE OF HOSPITAL CORRIDOR PRESCRIBING

Does the following scenario sound familiar? You are in the hospital making rounds and in the hall you meet a nurse you have known and worked with for years. After the usual exchange of pleasantries, she says, "Oh, doctor, I have got this terrible cold. Do you think you can give me a prescription for something? We are too busy in here for me to take time off to go see my regular doctor." (Sometimes, the request is not even for the hospital employee, but for a spouse or child.) You whip out a prescription pad and write an appropriate prescription. Remedy in hand, the nurse thanks you as she heads for the pharmacy, and you go on with your rounds.

There is nothing unique about this incident; the scene probably is replayed daily in hospitals everywhere. However, the Pennsylvania Medical Society Liability Insurance Company's (PMSLIC) all-physician Claims Committee has seen this scenario result in subsequent litigation against the physician involved and believes a word of caution is necessary in this regard.

A somewhat risky practice from a medical standpoint, "corridor prescribing" also is a bad habit to get into from a medical-legal point of view. Prescribing without benefit of a physical examination, often

without knowing the patient's history or, in cases involving requests for other family members, not even knowing the patient, is potentially legally dangerous for the physician. Additionally, it is fairly safe to assume that these hallway prescriptions are rarely documented anywhere, especially if the employee in question is not a regular patient of the physician. And, a minor distraction in the busy daily routine of a physician, the incident is soon out-of-mind, unrecorded, and forgotten.

Negligent drug therapy is one of the most commonly seen allegations in PMSLIC's claims experience. Prescribing as described above only adds to the inherent risks of drug therapy. The Claims Committee sees these cases years after the fact, after a hallway prescription results in an adverse side effect or reaction, and the employee sued the physician for negligent prescribing. At that point in time, the physician involved has no record of the prescription and probably no recollection of the incident to aid his defense.

Please be very cautious and discriminating in this practice; do not earn a reputation among hospital employees as being an easy target for on-the-spot prescribing. And, by all means, make a note of all such corridor transactions immediately, to be transcribed or at least filed for future reference should subsequent problems or litigation arise. (*Patient Rx Newsletter*, Pennsylvania Medical Society Liability Insurance Company, May 1988, Volume 10, No. 3)

PAST MALPRACTICE MAY BE KEPT FROM UNCLE SAM'S EYES

Doctors who have been sued or disciplined for medical negligence may have a clean slate, as far as the new national malpractice data bank is concerned. Under rules proposed by the Public Health Service, insurers, state licensing boards, and hospitals would not have to report malpractice payments or disciplinary actions relating to licensure and clinical privileges if they occur before the data bank's start-up date—now expected early next year. (*Medical Economics*, May 2, 1988)

PLAN FOR BRINGING DOWN LIABILITY COSTS

Congress is considering a bill to set one standard of liability for physicians and other professionals nationwide. Among other things, the statute would encourage alternative ways to resolve claims, limit attorney's fees based on a sliding scale, and hold plaintiff's attorneys liable for frivolous suits. Punitive damages would be awarded only if there is "clear and convincing evidence" that a physician exhibited malicious and reckless disregard for the patient's safety. If punitive damages were awarded, the plaintiff's share would be limited to no more than three times the compensatory damages; the balance would be paid to the state. (*Medical Economics*, May 2, 1988)

We'll put your patients up on a pedestal.

The Stone Center of New Jersey, the leader nationwide in lithotripsy advancement, is the premier center in the country to offer the bath-free Dornier HM-4 lithotripter.

At the Stone Center your patients rest comfortably on a water filled cushion... utilizing the most advanced lithotripsy technology available. Because they are not submerged in a tub, the procedure is less stressful and easier to perform. Your patients are treated in a sophisticated atmosphere by the state's top lithotripsy professionals. From our convenient

valet parking to our helpful and efficient patient representative who will schedule your cases... you'll rate our service second to none.

So contact Arlyn Rayfield, Executive Director, today and schedule an appointment for machine demonstrations or to receive additional information on ESWL[®] treatment.

Because your patients deserve to be put up on a pedestal.

The Stone Center of New Jersey. For the new wave in kidney stone treatment.

AMA Advisers MONEY MASTER

It's The One Account For All Your Money Management Needs!

The **AMA Advisers Money Master Account** is a state-of-the-art financial management system for managing your assets, investments, savings, expenses – even your insurance! With **Money Master**, you'll discover how easy personal finance can be and how much time you can save to do the things you'd rather do.

AMA Advisers Money Master Account simplifies financial management with:

- **Your Own Budget Analysis...** through the use of coded checks you'll see your monthly expenses sorted and totaled into one of 37 pre-set categories such as insurance premiums, charitable contributions, education, utilities, vacation and many more. Great for personal or professional budgeting!
- **Discount Brokerage Services...** that enable you to trade stocks, bonds, government securities, options and of course, mutual funds.
- **One Monthly Statement for ALL Your Investments.** In addition to investments made through your **AMA Advisers Money Master Account**, simply supply us with the appropriate information and for your convenience, we'll track your investments, even those made through other brokers or mutual fund organizations. All that you tell us about will be shown on your **Money Master Account** statement.

Building Mutual Trust

AMA ADVISERS, INC.

AMA Advisers, Inc. is a subsidiary of the American Medical Association and manages the mutual funds in The AMA Group.

Services and products as described herein are not offered for sale in any state where they are not lawfully registered.

• **Special Year-End Statement Practically Completes Your Tax Return For You!** At year end, you'll receive a statement so complete that it even shows the proper tax schedule to use for filing your return! All you do is transfer the information to the form.

• **High Money Market Returns On Your Checking Account!** You earn money market rates on all the money in your account until the day your check clears, since an AMA Money Fund Account is opened through the **Money Master Account**. You may write as many checks as you like for any amount – up to 20 free checks a month. After that, you pay just 30 cents per check.

If you would like convenience of a **Money Master Account**,

PALMA E. FORMICA, M.D.*

Tips for keeping reception room delays to a minimum is the subject of this essay by our president.

In reviewing a complaint about patient waiting time, I thought it might be appropriate to give physicians some tips to consider to alleviate this problem.

Start on Time. Plan ahead to arrive on time for office hours. Look over the schedule. How often have you been late in the past month to start hours? I cannot tell you how many times I have heard someone say, "I must hurry, I am late for hours!" If you have a meeting scheduled from noon to 1 P.M. every third Tuesday, then those hours should be rescheduled accordingly.

Review the Appointment Book. Most of us have an excellent receptionist, but under pressure from patients, she may have started to add to or to change the appointment schedule.

Review Instructions for Making Appointments. When was the last time you provided instructions for

your receptionist? Have you relegated this to the office manager, or is the receptionist expected to be clairvoyant? Are your instructions written in a manual? If so, when were they updated?

Identify Patients or Procedures which Normally Require More Time. Do you have talkative patients, patients requiring counseling, new patients, or complete patient examinations? Have the receptionist block out extra time with these considerations in mind.

Do a Time Study on a Typical Day. Have the receptionist indicate the time of arrival, appointment time, when the patient entered the examining room, time the physician entered the room, and of completion of the visit. This system will pinpoint areas of delay.

How Do You Handle Emergencies? Do you allow a block of time for emergencies, phone calls, or to catch up on work?

What about Walk-ins? Do you have a procedure? What about unavoidable delays? Do you telephone the office to apprise them of the delay? Do you have the staff notify patients who are waiting to give them the opportunity of rescheduling? If they decide to wait, do you have the office staff call those who have not arrived to inform them of the delay? Do you personally acknowledge the delay and apologize for the inconvenience?

Is the Reception Area Comfortable? Is there a sufficient quantity of timely reading material or patient education material?

Is Staffing Sufficient and Efficient? Are special arrangements made for those who need more time, or those who cannot afford to take time off from work to see you?

Are All Members of the Staff Courteous and Pleasant? Keep an ear open for patient complaints, and reward those staff members who are praised.

Is the Receptionist a Dragon-lady or a Darling? Your office represents you: your caring and concern are first presented to the public by your staff.

Keep an Eye on the Clock. If the visit drags on too long, have a prearranged set of instructions for the nurse, i.e. five minutes over, a tap on the door with a message that there is a phone call.

**“A big insurance company
that helps me build my practice?”**

**I don't
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

You told us you wanted an insurance program that can help broaden your patient base. Your patients told us they wanted more comprehensive medical coverage.

We listened. And developed Medallion. The best insurance for a healthy practice ...and your patients.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year inquiring about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you because with only a minimum of out-of-pocket expense, they will receive the maximum benefits of Medallion from a participating physician.

Comprehensive fee-for-service.

Medallion compensates you for the services you render while providing comprehensive care for your patients, including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not yet a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

HOWARD D. SLOBODIEN, M.D.

The New Jersey Division of the American Cancer Society, in its spring issue, recommends increased physician and patient awareness of the value of routine screening mammography.¹ It says, "There is a need for at least 1.2 million screening mammograms annually in New Jersey."

This publication comes in the face of others suggesting changes in the recommendations promulgated by the American Cancer Society, the American College of Radiology, and the American Medical Association. These recommendations include a baseline mammogram between ages 35 and 40, mammograms every one to two years between ages 40 and 50, and yearly mammograms beginning at age 50.

The first of the reports alluded to suggests that the intervals between breast x-rays in the latter two groups be reversed, i.e. that yearly mammograms be done between ages 40 and 50 and that the interval be changed to every two years thereafter. Moskowitz presents a cogent and logical argument for this approach;² if screening mammography can decrease mortality from breast cancer by detecting lesions before they are

palpable, it makes sense to do them more frequently when the rate of growth of the tumor tends to be more rapid. The rate of growth of breast cancer seems to be faster before age 50 and slower after that age; hence, reverse the original recommendations. Perfectly plausible, isn't it? (Others have written to agree.)

But now come two other articles! The first article is by Eddy et al.³ and the second article, an editorial by Bailar,⁴ comments on the Eddy study; these decry the value of any mammographic screening in women under age 50. Their conclusions: the benefits of mammography in this younger age group may not be significant when all elements are considered, unless positive risk factors are present in the individual woman. Eddy et al.³ suggest a flexible approach, with options to be decided by collaborative agreement between the physician and the patient. Bailar, though, is more emphatic,⁴ recommending the guidelines of the U.S. Preventive Services Task Force^{5,6} be followed, to "perform yearly clinical breast examination from age 40 onward, and begin annual mammography at age 50." Does this answer the questions raised by the DATTA study⁷ in 1987, or are we still in limbo?

The "rock and hard place" position looms before us. What is the proper recommendation to give our patients? Do we order screening mammograms yearly, every one to two years or not at all (with exceptions) in women ages 40 through 49? Do we order mammograms yearly, every one to two years, or biennially in women who have reached age 50? Although it may be a secondary consideration, how will the courts interpret conflicting recommendations? And, if 1.2 million yearly mammograms are needed in New Jersey, can we justify the expenditure of \$72 million to \$185 million annually, with a large part of that in the below 50 age group?

Your comments would be appreciated. As this goes to press, federal health officials are urging creation of a national breast cancer screening program.

NEW JERSEY'S NEW PSYCHIATRIC COMMITMENT LAW

JAMES E. GEORGE, M.D., J.D., MADELYN S. QUATTRONE, J.D., CARMELLA P. KEENER, J.D., WOODBURY*

Psychediatric commitment is a controversial subject due, in large part, to the important public policy concern that a person not be deprived of personal liberty without reasonable due process protections. Because involuntary commitment involves deprivations of liberty, the state attempts to balance the basic value of liberty with the need for safety and treatment. The law of psychiatric commitment creates this balance by setting standards and creating procedural safeguards that ensure only those persons

who are dangerous to themselves, others, or property are involuntarily committed. (Section 1(b))**

A new psychiatric commitment statute will take effect in New Jersey on November 7, 1988, creating

*From the law firm of George & Korin, Woodbury. Dr. George also is president of Emergency Physician Associates. Correspondence may be addressed to Dr. George, 307 South Evergreen Avenue, Woodbury, NJ 08096.

**All references are to Chapter 116, Laws of 1987, Assembly Number 1813, introduced February 3, 1986, approved May 7, 1987.

New Jersey's new psychiatric commitment law, designed to protect individual liberty and public health, safety, and welfare, provides mechanisms for the commitment of mentally ill individuals.

screening services which will serve as the entry point into the New Jersey public mental health services system (Figure).

The law provides clearer guidelines for the protection of individual liberty as well as public health and safety. The statute sets forth patient rights concerning advocacy and due process by requiring court hearings to determine whether initial or continued commitment is appropriate, and by providing patients with legal representation at those proceedings. In addition, the statute provides immunity from civil liability for certain individuals involved in the detention or transportation of an individual for the purpose of assessment or treatment.

POLICY AND PURPOSE

Under the U.S. Constitution, states have "police power" allowing them to make laws to protect the health, safety, and welfare of their citizens. Thus, the state of New Jersey has sought, with this law, to provide for the voluntary admission and the involuntary commitment of mentally ill individuals who are dangerous to themselves, to others, or to property. Such a law is necessary because some mentally ill individuals do not seek medical treatment or are not able to benefit from treatment provided on an outpatient basis. Therefore, the law provides for public services and facilities to meet the needs of those mentally ill individuals as well as the general public.

The statute sets forth several policies of the state: (1) Persons in mental health institutions should receive care in accordance with the highest professional standards and which will enable return to the community as soon as clinically possible. (2) The public mental health system should be developed in a manner which will protect individual liberty, provide for advocacy and due process for persons receiving treatment, and insure that treatment is consistent with the individual's clinical condition. (3) Counties are encouraged to develop screening services as the entry point to the public mental health care system, and short-term care facilities.

The statute indicates that the development and use of screening services and short-term care facilities are necessary "to strengthen the statewide public mental health care system, lessen inappropriate hospitalization and reliance on psychiatric institutions, and enable state and county facilities to provide the rehabilitative care needed by some mentally ill persons following their receipt of acute care." (Section 1(d))

APPLICABILITY

The provisions of the statute apply to all adults involuntarily committed to a short-term care facility, psychiatric facility, or special psychiatric hospital, and all adults voluntarily admitted from a screening service to a short-term care facility or psychiatric facility. The law does not apply to adults voluntarily admitted to psychiatric units in general hospitals or special psychiatric hospitals, except under certain, limited circumstances. (Section 3)

DEFINITIONS

The procedure outlined in the statute applies to those mentally ill persons who are dangerous to themselves, to others, or to property. "Dangerous to one's self" is defined to mean that "by reason of mental illness, the person has threatened or attempted suicide or serious bodily harm, or has behaved in such a manner as to indicate that the person is unable to satisfy his need for nourishment, essential medical care, or shelter, so it is probable that substantial bodily injury, serious physical debilitation, or death will result within the reasonably foreseeable future; however, no person shall be deemed to be unable to satisfy his need for nourishment, essential medical care, or shelter if he is able to satisfy such needs with the supervision and assistance of others who are willing and available." (Section (2)(h))

"Dangerous to others or property" means "by reason of mental illness, there is a substantial likelihood that the person will inflict serious bodily harm upon another person or cause serious property damage within the reasonably foreseeable future. This determination shall take into account a person's history, recent behavior, and any recent act or threat." (Section (2)(i))

"In need of involuntary commitment" means that "adult who is mentally ill, whose mental illness causes the person to be dangerous to self or dangerous to others or property, and who is unwilling to be admitted to a facility voluntarily for care, and who needs care at a short-term care facility, psychiatric facility, or special psychiatric hospital because other services are not appropriate or available to meet the person's mental health care needs." (Section 2(m))

"Voluntary admission" means "that adult who is mentally ill, whose mental illness causes the person to be dangerous to self or dangerous to others or property and who is willing to be admitted to a facility volun-

tarily for care at a short-term care facility or psychiatric facility because other facilities or services are not appropriate or available to meet the person's mental health needs. A person also may be voluntarily admitted to a psychiatric facility if his mental illness presents a substantial likelihood of rapid deterioration in functioning in the near future, and if there are no appropriate community alternatives available and the psychiatric facility can admit the person and remain within its rated capacity." (Section 2(ee))

PROCEDURES

1. Evaluation.

Screening Service. The statute provides that the screening service will serve as the entry point into the public mental health services system. The screening service will undertake an assessment of the person believed to be in need of commitment to a short-term care facility, psychiatric facility, or special psychiatric hospital. The assessment may take place at the screening service's facility. If the person subject to screening is in need of involuntary commitment and is unwilling or unable to come to the screening service for assessment, an assessment may take place through an outreach visit.

If the screening service determines that involuntary commitment is necessary, a psychiatrist shall make a determination based on information provided by the screener and his own assessment as to whether the person is in need of commitment, and shall complete the screening certificate. If commitment is deemed necessary, the screening service then will determine the appropriate type of facility for the person. The screening service should arrange for commitment and transportation to the appropriate facility as soon as possible.

If the screening service determines the person is not in need of admission or commitment to a short-term care facility, psychiatric facility, or special psychiatric hospital, the screener shall refer the individual to an appropriate community mental health service, social services agency, or appropriate professional for inpatient care in the psychiatric unit of a general hospital.

The statute also provides for the involvement of law enforcement officers. The officer may take custody of a person and take the person immediately to a screening service if: a) on the officer's personal observation, he has cause to believe the person is in need of involuntary commitment; b) the mental health screener has certified after an outreach visit that the individual is in need of involuntary commitment and has requested that the individual be taken to the screening service for assessment; or c) the court orders that a person subject to conditional discharge who has failed to meet the conditions of that discharge be taken to the screening service for assessment. The involvement of the officer at the screening service may continue for as long as necessary to protect the safety of the person in custody and the safety of the community from which the person was taken. (Section 6)

Furthermore, the statute provides immunity from civil liability for the law enforcement officer, screening

service, or short-term care facility staff person or their respective employers who, in good faith, take reasonable steps to assess, take custody of, detain, or transport an individual for purposes of mental health assessment or treatment. (Section 7)

2. Admission.

The procedures governing admission to a short-term care facility, psychiatric facility, or special psychiatric hospital differ depending upon whether an admission is voluntary or involuntary. Involuntary admission can be accomplished only by referral from a screening service or by temporary court order. A voluntary admission is permissible only after the individual has been advised orally and in writing of the discharge provisions to which he will be subject and the possibility that the facility may initiate involuntary commitment proceedings for the person.

3. Involuntary Commitment.

Detention. The person admitted involuntarily on referral from the screening service without a temporary court order may be detained for no more than 72 hours from when the screening certificate was executed. During this time, the facility shall initiate court proceedings for the involuntary commitment of the person.

Initiation of Court Proceedings. The facility shall submit to the court a copy of the screening certificate and a clinical certificate completed by a psychiatrist on the person's treating team, but the same physician shall not sign both unless the psychiatrist has been unable to have another psychiatrist conduct the examination and execute the certificate.

Court proceedings for the involuntary commitment of an individual not referred by a screening service shall be initiated by the submission to the court of two clinical certificates, at least one of which is prepared by a psychiatrist. In contrast to the 72-hour period for which an individual referred by a screening service may be held, an individual who has not been referred by the screening service shall not be involuntarily committed without a temporary court order.

Standard of Proof. If the court finds no probable cause for involuntary commitment, it shall dismiss the proceedings and order the individual's discharge. If the court finds that there is probable cause for involuntary commitment, it shall issue a temporary order authorizing the admission or retention of the person in the custody of the facility pending a final hearing.

Patient's Rights. The statute enumerates the rights of a patient admitted (either voluntarily or involuntarily) to a short-term care facility, psychiatric facility, or special psychiatric hospital. These rights include examinations and services in the patient's primary means of communication, e.g. interpreter, sign language, verbal explanation of the reasons for admission, the availability of an attorney, and the right to be represented by an attorney. If the patient is unable to afford an attorney or is unrepresented, the appropriate government agency will provide and pay for an attorney.

4. Continued Involuntary Commitment.

Patient's Court Hearing. An individual involuntarily

committed shall receive a court hearing within 20 days from initial inpatient admission and shall have counsel present. Testimony will be received by the court from a psychiatrist on the patient's treating team who has examined the individual no more than five days prior to the hearing, regarding the need for involuntary commitment. Members of the individual's family may testify, if appropriate. The individual has the right to present evidence, to cross examine witnesses, and to have a hearing *in camera*, e.g. in a judge's chambers, or with spectators excused from courtroom if the individual so requests.

Standard of Proof. If the court finds by clear and convincing evidence that the patient needs continued involuntary commitment, it shall order such commitment and shall schedule a subsequent court hearing to take place only in the event the patient has not been administratively discharged by the institution on recommendation of his treating team.

If the court finds that the patient does not need continued involuntary commitment, it shall order the release of the patient by the facility within 48 hours.

If the court finds that the patient's history indicates a high likelihood of rehospitalization because of the patient's failure to comply with discharge plans, the court may discharge a patient subject to conditions recommended by the facility and staff, but such conditions shall be specific and their duration shall not exceed 90 days.

Periodic Reviews. A patient committed pursuant to a court order shall be afforded periodic court hearings to review the need for continued involuntary commitment.

5. Administrative Discharge.

The treatment team at a psychiatric facility, short-term care facility, or special psychiatric hospital shall administratively discharge a patient from involuntary commitment status if the treatment team determines the patient no longer needs involuntary commitment. The person discharged shall have a discharge plan designed by the treatment team and the patient. The patient shall receive followup care and interim financial assistance pending determination of public benefit entitlements when appropriate under regulations promulgated by the commissioner of the Department of Human Services.

6. Voluntary Patients.

At the patient's request, he shall be discharged by the treatment team within 48 hours or at the end of the next working day from the request, whichever is longer. However, the treatment team may determine that the patient needs involuntary commitment. In such a case, the treatment team shall initiate court proceedings under proper procedure. Thus, the facility shall detain the individual beyond the time prescribed above, i.e. the longer of 48 hours or end of next working day, only if the court has issued a temporary court order.

The voluntarily admitted patient has the same rights and privileges afforded involuntary patients. These rights include examinations and services in the patient's primary means of communication, verbal ex-

planation of the reasons for admission, and the right to be represented by an attorney (with the attendant right to have an attorney provided and paid for by the appropriate government agency).

CONCLUSION

While the new law may be interpreted as adding an additional bureaucratic layer to the process of psychiatric commitment, it has some potential benefits as well. This law provides guidelines for the balancing of public health, safety, and welfare against the right of personal liberty. The installation of the screening service as the entry point into the public mental health services system is intended to provide an additional safeguard so that only mentally ill persons are committed. In those situations in which a screening service has not referred an individual, the individual may not be committed, even temporarily, without a court order.

Physicians may enter the psychiatric admission/commitment process at many stages. In those cases in which the patient has not been referred by a screening certificate, court proceedings for commitment require two clinical certificates, at least one of which is signed by a psychiatrist. A physician who has evaluated a patient may be asked to sign the second clinical certificate certifying his belief that the individual is in need of psychiatric commitment. The physician also may come into contact with the individual as a result of the individual's admission to the psychiatric unit of a general hospital in cases in which the screening service has determined that admission or commitment to a short-term care facility, psychiatric facility, or special psychiatric hospital is unnecessary.

In addition, psychiatrists may become involved in several situations. First, the psychiatrist may determine that one of his patients should be admitted or committed to a short-term care facility, psychiatric facility, or special psychiatric hospital. Second, the psychiatrist may become involved as a result of the screening service's request that the psychiatrist sign a screening certificate certifying that the individual is in need of psychiatric commitment/admission. Third, the psychiatrist's involvement may be directly related to his affiliation with a short-term care facility, psychiatric facility, or special psychiatric hospital in which the psychiatrist is a member of the individual's treating team. In any of these events, the psychiatrist may be asked to testify in a court hearing in which the court will determine whether initial or continued commitment is appropriate.

This new law will have a broad impact on the process of psychiatric commitment in New Jersey. It will require more involvement from the psychiatric health care community.

This new law is expected to cost more money than currently is being spent in this area. The statute provides: "Any costs incurred to comply with the provisions of this act will be considered allowable in establishment of rates, which are to be set in a regulatory environment." (Section 31)

The statute also provides an appropriation of

COVER STORY

\$100,000 from the general fund to the Department of Human Services. This appropriation is for the purpose of "develop[ing] training procedures for law enforcement personnel and additional outreach and psychiatric services." (Section 32) Will these financing provisions provide the necessary funds for this new law? Will the money come from state government or county government, or some combination of the two governments?

Are there adequate mental health facilities in ex-

istence to implement the provisions of this new law? The legislation states that counties are encouraged to develop "short-term care facilities to enable a mentally ill person to receive acute, inpatient care in a facility near the person's community." (Section 1(d)) How will this be accomplished and who will pay for it?

Two things are clear: This new law will affect all physicians, nurses, and mental health professionals in the state of New Jersey and November 7, 1988, will be upon us all too soon. Are we ready?

A NEW H₂ Antagonist

AXID[®] 300mg nizatidine

Effective once-nightly
duodenal ulcer therapy available in a
Unique Convenience Pak
for better patient compliance

AXID[®] nizatidine capsules

Brief Summary. Consult the package insert for prescribing information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients, at a reduced dosage of 150 mg h.s. after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H₂-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix[®] may occur during therapy with nizatidine.

Drug Interactions—No interactions have been observed between Axid and theophylline, chlorazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high dose males compared to placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement

compared to concurrent controls, and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive, and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 300 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery is not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, and the mouse lymphoma assay.

In a two-generation, perinatal and postnatal, fertility study in rats, doses of nizatidine up to 500 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose, and in Dutch Belted rabbits at doses up to 55 times the human dose, revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Nizatidine is secreted and concentrated in the milk of lactating rats. Pups reared by treated lactating rats had depressed growth rates. Although no studies have been conducted in lactating women, nizatidine is assumed to be secreted in human milk, and caution should be exercised when nizatidine is administered to nursing mothers.

Pediatric Use—Safety and effectiveness in children have not been established. Use in Elderly Patients—Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Domestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among the more common adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events were also reported; it was not possible to

determine whether these were caused by nizatidine.

Hepatic—Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT [AST], SGPT [ALT], or alkaline phosphatase), occurred in some patients possibly or probably related to nizatidine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L), and in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three times the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hematologic—Fatal thrombocytopenia was reported in a patient who was treated with Axid and another H₂-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs. **Integumental**—Sweating and urticaria were reported significantly more frequently in nizatidine than in placebo patients. Rash and exfoliative dermatitis were also reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported.

Overdosage: There is little clinical experience with overdosage of Axid in humans. If overdosage occurs, use of activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous LD₅₀ values in the rat and mouse were 301 mg/kg and 232 mg/kg respectively. PV 2091 AMP [041288]

STEROID DANGER IN KEARNS-SAYRE SYNDROME (KSS)

BURTON M. FEINSMITH, M.D., WILLIAM P. LIEBESMAN, M.D., PIERRE GUIBOR, M.D., WESTFIELD*

KSS is caused by a defect in mitochondrial oxidative phosphorylation which inhibits synthesis of adenosine triphosphate and impairs oxidative metabolism. A steroid-induced glucose load exacerbates this, and a severe metabolic derangement with high mortality can result.

Kearns-Sayre syndrome (KSS), an important although rare mitochondrial disease, can cause unpredictable sudden death, including death with the use of steroids. In its fully developed state, KSS consists of progressive external ophthalmoplegia, pigmentary retinopathy, and heart block. These and other associated abnormalities are described as an aid to diagnosis so that therapy may be begun early, and treatment with steroids avoided.

CASE PRESENTATION

The patient, an 18-year-old white male, was the product of a 37-week gestation, during which time his mother had self-controlled bleeding in the first trimester. He had a breech delivery aided by forceps. During early childhood, he experienced no unusual illnesses. Since age 2 years, he has been below the 25th percentile for height and weight (Figure 1). A maternal half-brother is short of stature, and there is a diabetic history in a paternal half-sister and the maternal grandfather.

At age 6, he developed a mild, intermittent drooping of his left upper lid, and over the next two years his right upper lid became similarly affected. Eye muscle movements and retinal examinations were normal. During this time, it was determined that he had a learning disorder.

Mild hearing loss was noted at age eight, and a 1+ proteinuria was found. There were no other renal findings. At age nine, excessive fatigue was noted on mild exertion along with weakness of his limb muscles, but tests for myasthenia gravis were negative. An electrocardiogram showed a mild conduction defect with a short PR interval. Serum lactate was 24.1 mg/dL (n=8.0-20.0 mg/dL) and pyruvate was 1.45 mg/dL (n=less than 1.10 mg/dL). A fine pigment granularity was noted in the macula of each eye.

At age 10, mild limitations of upward and lateral gaze were noted, the ptosis and retinal pigment changes remaining mild; vision was correctable to 20/20 in each eye. His proteinuria had increased to 2+. At age 12, a Wolff-Parkinson-White syndrome, type A, was diagnosed. The cardiac evaluation, including an echocardiogram, revealed no other abnormalities. Blood sugar was normal; proteinuria remained at 2+. Renal studies, including an intravenous pyelogram, were normal.

At age 14, proteinuria increased to 3+; he was re-

*Dr. FeinSmith is Assistant Clinical Professor of Pediatrics, Columbia University. Dr. Lieberman is Clinical Instructor, Ophthalmology, Mt. Sinai School of Medicine, New York. Dr. Guibor is Director, Oculo-Plastic Service, New York Medical College, Valhalla. Correspondence may be addressed to Dr. FeinSmith, 275 Orchard Street, Westfield, NJ 07090.

ferred to the nephrology division of a university hospital, but no treatment was prescribed. A neurosensory hearing loss was recognized. From age 14 on, there was a worsening of the ptosis, along with a further weakening of the extraocular, facial, and limb muscles. There was an increase in the retinal pigment dispersion along with the onset of night vision difficulties. A renal biopsy at age 16 was interpreted as either idiopathic focal segmental glomerulosclerosis or glomerulosclerosis due to arterionephrosclerosis. Intermittent blood pressure elevations also were noted.

At age 17, because of the longstanding nephrotic picture, his nephrologist prescribed prednisone, 20 mg three times a day for one month, to be tapered by alternate day dosage for one month, with weekly observations of his blood pressure and proteinuria.

After the sixth week of treatment and approximately 24 hours after taking his last dose of steroid, the patient had three generalized convulsions. He had just consumed a quantity of "cola." He was taken to a local hospital, where he suffered two similar seizures. He was somnolent, and laboratory findings showed a blood sugar of 954 mg/dL, pH of 7.33 ($n=7.35-7.45$), Na 130 mEq/L, K 4.1 mEq/L, and urine sugar 3+, protein 1+, and ketones 1+. There was no past history of convulsions or diabetes. He was given insulin, intravenous fluid, valium, and dilantin. Subsequently, he was transferred to a university hospital in a somnolent state. He was noted to have a Cushingoid appearance. Ongoing treatment had produced the following results: blood sugar 123 mg/dL, pH 7.43, Na 147 mEq/L, K 3.7 mEq/L, Cl 110 mEq/L, CO_2 24 mEq/L, pCO_2 44 mmHg, and pO_2 70 mmHg. Urinalysis showed sugar 3+, protein 1+, ketones 1+, WBC 5-10/HPF, and RBC 20-50/HPF. Blood pressure was 130/86, pulse 114, temperature 100.2° F, and respiration 16/minute.

Rehydration was continued, along with the administration of insulin and dilantin, and he rapidly recovered. A contrast-enhanced computed tomography (CT) scan and an MRI were normal. EEG was abnormal, with multiple, paroxysmal bursts of high amplitude delta waves in the frontal and central regions. Cerebrospinal fluid findings were normal. Biopsy of the quadriceps muscle showed abnormal clusters of mitochondria. A pediatric nephrologist observed that his proteinuria of 1.2 g/day had changed little as the result of six weeks of steroids.

After one week, he was discharged on dilantin and insulin, which were stopped shortly after his return home, and, over the past year, he has had no convulsions and his blood sugar has remained normal. Recently, due to the severity of the ptosis and an almost complete paralysis of upward and lateral gaze, conservative ptosis surgery was performed on each upper lid which he tolerated well. The tissue obtained was insufficient for microscopic and biochemical studies. His vision was correctable to 20/30 in each eye, and he has since returned to his usual activities.

KEARNS-SAYRE SYNDROME

In 1958, Kearns and Sayre reported the association of progressive external ophthalmoplegia, pigmentary retinopathy, and heart block. Studies have shown Kearns-Sayre syndrome (KSS) to be a rare, multi-system, mitochondrial disease characterized by spo-

Figure 1—Physical growth chart for boys, ages 2 to 18 from the National Center for Health Statistics.

radic occurrence, progression, and sudden death. Its onset usually is under the age of 20, and it is ushered in by ptosis or extraocular muscle pareses, both of which are progressive. Diplopia is an uncommon complaint, and the ophthalmoplegia appears troublesome only when it becomes total.¹⁻¹⁰

A pigmentary type of retinopathy occurs but may be delayed by years. It differs from retinitis pigmentosa by showing a fine, "salt and pepper" dispersion of pigment, more central in location, and without associated vascular or optic nerve changes. Decreased acuity and night blindness can occur, but afferent pupillary defects and severe visual loss are seldom seen. The electroretinogram often is normal, and the retinal pathology usually has a mild, benign course. A breakdown in the energy relationship between the retinal pigment epithelium (RPE) and the photoreceptor layer appears responsible for these retinal changes.¹⁻¹⁰

Cardiac conduction defects occur in KSS, but heart block may not occur until months or years after other manifestations of the disease. These patients must be followed closely as cardiac arrest can occur abruptly. Treatment by pacemaking in some arrhythmias has improved the length and quality of life. Sudden death may occur from other manifestations of the disease, such as spongiform degeneration of the brain.^{3,11-17}

Since the original description by Kearns and Sayre, many associated findings have been reported. In the fully developed syndrome, Berenberg and coworkers noted: cerebellar signs (69 percent), short stature (63 percent), neurosensory hearing loss (54 percent), intellectual impairment (40 percent), vestibular system

dysfunction (33 percent), and delayed puberty (33 percent).³ Elevated serum lactate and pyruvate are a prominent part of the syndrome.^{15,18-20} Cerebrospinal fluid protein has been over 100 mg/dL in 80 percent of the cases and has been used to predict those patients most likely to develop the full syndrome.³ Among other findings are diabetes mellitus,²¹ hypoparathyroidism and intracranial calcifications,²²⁻²⁵ hypogonadism,²⁶ growth hormone deficiency,^{27,28} neuropathy,^{15,23} abnormalities on CT scanning,^{29,30} limb and cranial nerve weaknesses,³ abnormal electroencephalography (EEG),^{3,4,26} and Wolff-Parkinson-White syndrome (WPW).² In autopsied cases, spongiform degeneration of the brain is a constant finding and has been responsible for a wide range of neurological abnormalities, some of which lead to sudden death.^{3,14,31}

Electron microscopy of stained skeletal muscle reveals a characteristic pathology of type 1 fibers, which are rich in mitochondria and responsible for slow, sustained contraction. They are torn and show bright-red staining material. These "ragged-red fibers" derive most of their energy from mitochondrial oxidative phosphorylation (OXPHOS). By contrast, type 2 fibers, responsible for fast, short-duration contractions and dependent on glycolysis for energy, appear normal. "Ragged-red fibers" show highly altered and degenerated areas having coarse, clumped material; these contain abnormal clusters of distorted and swollen mitochondria. Inability to meet energy demand, resulting from impaired OXPHOS, causes these mitochondrial attempts at compensatory proliferation. This muscle picture is called "mitochondrial myopathy"; it should be noted, however, that "ragged-red fibers" and morphological alterations in mitochondria, even though a constant finding in KSS, are nonspecific and observed in a variety of muscle disorders.^{2-8,15,20,26,27,32-35}

OXPHOS

In KSS, there is a basic defect in OXPHOS, resulting in a decreased production of adenosine triphosphate (ATP) by the mitochondrion, along with an accumulation of hydrogen ions. Normal cellular activity depends on a steady supply of high energy phosphate from ATP, and its resynthesis from adenosine diphosphate (ADP) and phosphate must be rapid and efficient. Most of the energy required to accomplish this resynthesis is supplied by OXPHOS, which is controlled by nuclear and mitochondrial OXPHOS genes. During OXPHOS, a charge is given to the mitochondrial inner membrane by a complex process utilizing the controlled burning of hydrogen (from foodstuffs) with oxygen. This energy charge "drives" ATP synthase to condense ADP with phosphate to make ATP, and under aerobic conditions with unimpaired oxidative metabolism, hydrogen ions do not accumulate. An OXPHOS deficiency, however, reduces ATP resynthesis, impairing steady-state aerobic processes and recovery from oxygen debt; hydrogen ions accumulate and lead to lactic acidosis. Increased cellular energy demand exacerbates this. The ongoing OXPHOS deficiency causes progressive changes in all organ systems; those heavily dependent on OXPHOS are the most affected and include the brain, heart, kidney, liver, and type 1 skeletal muscle.²⁰

A less efficient pathway for ATP manufacture is anaerobic glycolysis, from which lactate and water re-

sult; but, lactic acidosis is unlikely if oxidative metabolism is unimpaired, since there is no net increase in the number of hydrogen ions. An OXPHOS defect or inadequate oxygen intake can alter this by causing hydrogen ions to accumulate; the resultant acidotic changes can have a profound effect on enzyme systems and tissue function.

NON-MENDELIAN MITOCHONDRIAL INHERITANCE

The etiology of the mitochondrial OXPHOS defect is unknown; but, heredity, slow virus, and autoimmune disease have been advanced as possible causes. A possible genetic factor must be considered. Genes are located on chromosome pairs in the nucleus and are contributed equally by each parent, except for one set that is located in the cytoplasm and inherited only from the mother. This set is found in the mitochondrion, a cytoplasmic organelle responsible for producing most of the ATP necessary to energize a human being. The mitochondrial genome (gene system) includes 13 OXPHOS genes, all vital to normal ATP production. Each of these genes has its own specific deoxyribonucleic acid (DNA) and genetic code, totally independent of nuclear genes, and without access to the mitotic spindle.^{3,20,36}

The sperm has little cytoplasm and few mitochondria, and does not contribute to mitochondrial inheritance. Through direct cytoplasmic continuity, only the mother transmits mitochondrial genes to the next generation. Mitochondrial DNA mutates much faster than nuclear DNA, and a sufficient distribution of mutant, maternal mitochondrial DNA can cause a phenotype change. Studies of families in which KSS has appeared, along with studies of other mitochondrial diseases having some common features, bring up the possibility of a maternal, cytoplasmic DNA transmission; if KSS is hereditary, its apparent departure from Mendelian principles would tend to place the defect in the mitochondrial, not the nuclear, OXPHOS genes.^{20,36}

ALTERED CARBOHYDRATE METABOLISM

An ATP deficiency, resulting from a mitochondrial OXPHOS defect, impairs cellular oxidative processes and alters carbohydrate metabolism with lactate and pyruvate accumulating; indeed, lactate and pyruvate are seen to soar after glucose-loading or exercise at any stage of KSS. The imbalance between ATP synthesis and hydrolysis results in an excess of hydrogen ions, which dissipate by converting lactate to lactic acid. Increased energy demand accelerates this, and hyperglycemia, such as that induced by steroids, causes lactic acid to accumulate (Figure 2). During periods of increased physical activity, lactic acid accumulation in skeletal muscle is severely exacerbated due to the weakness of a defective OXPHOS system in trying to help meet the metabolic demand for increased oxygenation.^{15,37,38}

A pancreatic OXPHOS deficiency compromises insulin production, and the stressing of this pathway causes a diabetic picture. Such stress occurs with glucose accumulation, which can be steroid-induced (Figure 2). Steroids also have a direct inhibitory effect on insulin effectiveness; this impedes peripheral utilization of glucose and intensifies existing diabetes.

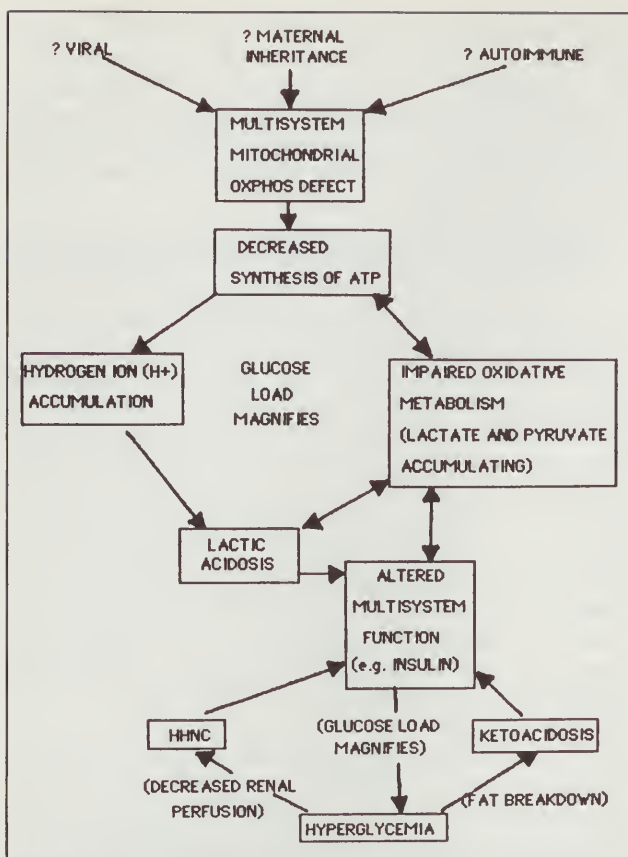

Figure 2—Tracking diagram of Kearns-Sayre syndrome.

With unimpaired insulin production, however, it is unusual for steroids to cause more than a slight blood sugar rise.

Biochemical analysis of mitochondria in skeletal muscle suggests that the OXPHOS deficiency may be due to a defect in NADH dehydrogenase (complex 1)^{18,20} and Ogasahara and coworkers³⁷ have reported prevention of the lactate-pyruvate rise by the use of coenzyme Q₁₀. Low folate levels seen in KSS also may play a role, and treatment with folic acid has been suggested.^{39,40}

HYPEROSMOLAR, HYPERGLYCEMIC, NONKETOTIC COMA (HHNC)

If excess water loss and decreased renal perfusion accompany hyperglycemia, there can occur a syndrome characterized by: serum hyperosmolality of over 340 mOsm/L; variable neurological signs, including depressed sensorium, seizures, and frank coma; hyperglycemia of over 541 mg/dL with minimal ketosis; severe dehydration; and high mortality. This is called hyperosmolar, hyperglycemic, nonketotic coma (HHNC) and most commonly is seen in older diabetics with renal disease.⁴¹⁻⁴³

KSS patients treated with steroids appear to be prone to HHNC with OXPHOS defects in the pancreas and kidneys, and possibly the adrenals, playing major roles. The sequence may be explained as follows: a steroid-induced glucose load cannot be disposed of, and hyperglycemia causes glucosuria with an osmotic diuresis. Renal disease and adrenal insufficiency can contribute. The resultant blood volume deficiency shows a water deficit that is initially greater than that of electrolytes, causing an extracellular hyperosmolali-

ty. This results in an impaired sensorium, interfering with the patient's urge for fluid replacement. Decreased renal perfusion takes over the dominant role, and increasing hyperosmolality, hyperglycemia, and dehydration can rapidly lead to coma (Figure 2). Insulin levels at this stage usually are marginally sufficient to support energy needs, so the body does not have to turn appreciably to fat stores whose excessive breakdown would cause severe ketosis. The insulin therapy needed by surviving patients appears to be unchanged from that required before the HHNC. Lactic acid accumulation in KSS is exacerbated in HHNC due to an impaired cellular oxidative response to hyperglycemia. Flynn and coworkers reported two cases of hyperosmolar, hyperglycemic, lacticidotic coma, and death in KSS patients treated with steroids for muscle weakness.^{15,41-44}

DISCUSSION

This case emphasizes the danger of steroid therapy in KSS. Steroids were given to treat a longstanding nephrotic syndrome. The resultant glucose load, however, triggered a series of events: increased cellular energy demand caused an acidotic state because of added stress on a defective OXPHOS system, further impairing ATP synthesis and oxidative metabolism; a pancreatic OXPHOS defect compromised the insulin response and caused hyperglycemia; and reduced blood volume with decreased renal perfusion resulted, causing hyperosmolar, hyperglycemic, nonketotic coma (HHNC). This possibly was accelerated by an OXPHOS defect in the kidneys and a steroid effect on the adrenals. Increased carbohydrate intake in the form of "cola" exacerbated these events.

Fortunately, the patient's metabolic derangement was diagnosed and treated before an irreversible state appeared. Rehydration and normal electrolyte balance were carefully achieved. Blood glucose was normalized promptly, alleviating hyperglycemic stress and preventing severe acidosis. Mild acidosis readily responded to treatment, and brain dysfunction, as manifest by somnolence, convulsions, and abnormal electroencephalography, did not result in permanent, detectable consequences. Even though treating hospital physicians concurred with the diagnosis of KSS, serum lactate and pyruvate were not obtained. Upon recovery, the patient's OXPHOS system appeared sufficient to maintain a relatively normal, though tenuous, carbohydrate metabolism without the need for insulin. Subsequent anticonvulsant therapy was not required.

The steroid-induced changes that occur in KSS patients who have significant pancreatic involvement are interrelated: with HHNC, ketoacids are moderately elevated; with diabetic ketoacidosis, there is a degree of hyperosmolality; and, with a compromised OXPHOS system, lactic acidosis plays an early, prominent role, being exacerbated by hyperglycemia and HHNC (Figure 2). These result in a further weakening of enzyme systems and metabolic processes.

Some progress has been made in the treatment of these energy-compromised people; cardiac pacemaking in certain arrhythmias has improved the length and quality of life; metabolic imbalances and endocrine deficiencies have been helped; and, ptosis surgery in selected cases has improved vision, head posture, and

cosmesis. Coenzyme Q₁₀ has been reported to improve both cardiac function and carbohydrate metabolism, and the use of folic acid also has been advocated. Carbohydrate restriction and steroid avoidance appear to be essential. It is in the central nervous system, however, where the most ominous features of the disease exist, as these are disabling, progressive, life-threatening, and untreatable. Muscle weakness also appears to be refractory to treatment at this time.

Many abnormalities eventually are seen in KSS, but any treatment undertaken must be done with great caution in order to minimize stress to a defective OXPHOS system. Above all, physicians must be alert to the danger of giving steroids to KSS patients and aware of the need to maintain close cardiac supervision. In the developing syndrome, usually beginning in early childhood, the initial signs may be subtle, and the diagnosis can be missed. It should, however, be kept in mind whenever steroids cause a severe, unexpected disturbance in carbohydrate metabolism.

**“A fee-for-service insurance program
with complete office coverage?”**

**I don't
believe it.”**

**Believe it!
Medallion.
From Blue Cross and Blue Shield.**

When you asked for a fee-for-service insurance program with comprehensive medical coverage, we listened. Because we all share a common concern, the welfare of your patient.

And when you told us fee-for-service had to cover all your in-office claims, we heard you.

Together we've developed Medallion, the best insurance for a healthy practice—and your patients.

Comprehensive fee-for-service.

The insurance program you want with the comprehensive medical coverage your patients need, including office visits, well child care and unlimited laboratory and X-ray services. Just bill your usual charges for each and every service you perform.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice

CASE REPORT: THYROXINE OVERDOSE CAUSED BY A SUICIDE ATTEMPT IN AN ADULT

T. STURGIS, M.D., R.L. ROSENBAUM, M.D., H. GERHARD, M.D., SUMMIT*

The authors describe a case of massive thyroid hormone ingestion. They achieved a benign outcome with the use of beta blockers, barbiturates, and iodinated radiographic contrast material. Use of thyroid medication in depressed patients without clinical thyroid disease involves risk.

Thyroid hormone traditionally has been used to treat hypothyroidism and to suppress benign and malignant thyroid neoplasms. Recently, the use of thyroid hormone has been advocated for other conditions such as depression and premenstrual syndrome. The authors describe a depressed patient without known pre-existing clinical thyroid disease who took a massive dose of thyroid hormone in an attempt to commit suicide.

CASE REPORT

A 36-year-old woman with a history of severe depression was given 100 tablets of l-thyroxine 0.025 mg for unclear reasons. No other medication was prescribed. Twenty-four hours later, on New Year's Day, she swallowed the entire contents of the unused bottle. Ipecac and charcoal were administered, and minimal retained contents were obtained with gastric lavage.

The patient was admitted to the intensive care unit. She remained awake, but was agitated and depressed. Initial examination revealed blood pressure 134/90, pulse 107, warm and moist hands with fine tremor, and brisk reflexes. The thyroid gland was not enlarged.

She was treated with propranolol 20 to 40 mg by mouth every 4 hours to maintain pulse at 80/min or less. Phenobarbital, 30 to 60 mg every 6 hours, was given for agitation and detoxification, and 500 mg of

sodium ipodate (Oragrafin Sodium®) was added by mouth every 12 hours to inhibit peripheral conversion of thyroid hormone (T_4 to T_3).

Initial (and peak) thyroid hormone values obtained on admission were as follows: T_4 (thyroxine) 25.0 mcg/ml (normal 5.0-12.0), T_3 (triiodothyronine) uptake 46 (normal 30-40), free T_4 Index 7.7 (normal 1.0-3.2), T_3 RIA (triiodothyronine by radioimmunoassay) 490.0 ng/dl (normal 80-200), and TSH (thyroid-stimulating hormone) 2.7 mIU/ml (normal less than 10.0).

Clinical hyperthyroidism resolved within 72 hours, and the patient had a benign course with respect to her physical status. Serum T_3 RIA normalized on the third hospital day, and serum T_4 did likewise on the seventh hospital day, at which point antithyroid medication was tapered and discontinued (Table). The patient was transferred to the psychiatric service, and was not resumed on l-thyroxine.

DISCUSSION

The serum half-life ($t_{1/2}$) of T_4 is between six to eight days, whereas the $t_{1/2}$ of T_3 is approximately one to one-and-one-half days.¹ However, serum levels of T_3 can

TABLE
Thyroid Function Tests after Acute
Ingestion of L-thyroxine

	T ₄	T ₃ Uptake	Calculated T ₄ Index	T ₃ RIA
Reference	5.0-	30-	1.0-	80.0-
Range:	12.0	40	3.2	200.0
Units	mcg/ml	%		ng/dl
Day 1	25.0	46	7.7	490.0
2	19.2	42	5.4	367.0
3	16.8	39	4.4	149.0
4	14.2	40	3.8	136.0
5	13.9	39	3.6	86.0
7	11.0	53	3.9	78.0
9	10.5	37	2.6	

remain elevated due to ongoing peripheral conversion of T₄ to T₃, as would be expected in a bolus administration of thyroxine, such as occurred in this case. The Table outlines the net effects of these factors.

Serum T₄ levels, serum T₃ levels, and the T₃ resin uptake are shown in the Table.¹ Although confirmatory, the T₃ resin uptake reflects binding globulin status, and by itself is not diagnostic of primary thyroidal dysfunction. The calculated free T₄ index will adjust total serum T₄ concentration for changes in binding, and, therefore, is a better parameter of free T₄ hormone levels and thyroid function.

A variety of pharmacological measures can be used to lower thyroid hormone levels, either by inhibiting peripheral conversion or by increasing hormone clearance. The drugs used in the management of this case have an additive effect in restoring the euthyroid state.

Propanolol has a beneficial antiadrenergic effect on tremulousness and tachycardia, has an antihypertensive effect, and inhibits peripheral conversion of T₄ to T₃. Phenobarbital enhances hepatocellular binding of thyroid hormone, and thus increases thyroxine turnover and clearance.²

More recently, sodium ipodate (Oraqrafin Sodium[®]) and oral cholecystographic agent have been advocated for use in hyperthyroidism.³ Iodate has been shown to be one of the most potent inhibitors of thyroxine (T₄) peripheral conversion to triiodothyronine (T₃) with minimal toxicity. In selected cases, combined use of these agents may obviate the need for steroids.

The total amount of thyroid hormone consumed in this case was approximately 2500 micrograms. Although quite excessive,^{4,5} it is of the same order as recently reported in an outbreak of thyrotoxicosis factitia.⁶

Most cases of massive thyroid ingestion reported in the literature describe pediatric patients, several of whom had adverse sequelae including arrhythmias, seizures, and tremulousness.^{7,9} As this case confirms, benign outcomes have been reported.¹⁰

We have seen thyroid hormone being used with increased frequency for a variety of conditions other than hypothyroidism or goiter. This case points out the potential for abuse, and we recommend that thyroid hormone be used only where documented thyroid disease is present.¹¹

REVIEW ARTICLE: BIOLOGICAL ACTIVITIES OF CHLOROPHYLL DERIVATIVES

SIMON A. CHERNOMORSKY, PH.D., AND ALVIN B. SEGELMAN, PH.D., PISCATAWAY*

The authors review the anti-inflammatory, wound healing, and malodor-reducing properties of chlorophyllin, a chlorophyll-related medicinal agent; the study includes plant-derived, chlorophyll-based compounds under study as useful anticancer, antiatherosclerosis, and antipsoriasis drugs.

Although chlorophyll generally is known as the major photosynthetic porphyrin pigment in plants, some of its chemical derivatives exhibit interesting biological activities in animals and humans. It has been at least 14 years since the last survey on this subject appeared.¹ The purpose of this article is to present a brief review of the older literature, the more recent publications, and some unpublished results of our ongoing studies. Selected aspects of the biological activities of chlorophyll derivatives, especially chlorophyllin copper complex (CCC), a centrally coordinated metal tetrapyrrole compound, with particular emphasis on stimulation of cell regeneration, influence on wound-healing retardation factors, toxicological characteristics, and the clinical application of CCC as a wound healing and deodorizing agent will be discussed. Furthermore, the possible utilization of these substances as therapeutic agents in some new, promising areas, also will be described.

PRECLINICAL STUDIES

Smith and Sano were among the first workers to investigate the effects of chlorophyll derivatives on cell growth using tissue culture methods.² The addition of 0.05 or 0.5 percent of CCC to cultured embryonic mouse heart fibroblasts resulted in a rapidly increased growth rate (40 percent) which was maintained by

replenishing the CCC every 48 hours. Another tissue culture study demonstrated similar growth stimulating effects of chlorophyll derivatives. For example, these substances at concentrations of $2 \times 10^{-4} \text{M}$ increased by 31 percent the neurite outgrowth in mouse neuroblastoma cells.³

The observations made on the tissue culture studies also were investigated in animal experiments. Ointments containing chlorophyll derivatives which were applied to guinea pigs and rabbits with induced skin wounds resulted in faster healing rates than those occurring with some other agents tested. "Chlorophyll" therapy initiated early appearance of clean granulation tissue, rapid epithelization, and acceleration of wound healing without inflammation.⁴ Similar studies in various animals showed that CCC consistently displayed statistically significant effects, increasing the rate of healing by approximately 25 percent in about 68 percent of the cases of traumatic and thermal wounds.⁵ Additional experiments using topical "chlorophyll" therapy supported the positive wound healing effects noted earlier.⁶ Chlorophyll derivatives

*Dr. Chernomorsky is affiliated with Biopharm and Dr. Segelman is an associate professor of pharmacognosy with the Department of Chemical Biology and Pharmacognosy, Rutgers University. Correspondence may be addressed to Dr. Chernomorsky, Biopharm, P.O. Box 2882, Elizabeth, NJ 07207.

led to activation of fibroblasts, reduction of epithelialization time, and marked increases in cell mitotic indices which accompanied accelerated wound healing. Also, it was observed that the number of blood vessels and the resultant circulation in the chlorophyll-treated wounds were increased.^{7,8}

In connection with wound healing, one of the concerns among clinicians is the recognition that topical wounds and ulcers frequently are infected. Thus, even when treated by preparations which stimulate cell regeneration, infected areas heal poorly. Clearly, an ideal wound-healing agent should demonstrate dual actions: cell regeneration as well as antimicrobial properties. In a series of further investigations, it was shown that CCC⁹⁻¹¹ and other chlorophyll derivatives^{12,13} were bacteriostatic in vitro, mainly against gram-positive microorganisms, some of which are wound pathogens. Also, these substances neutralized *Staphylococcus aureus* and *Clostridium perfringens* toxins¹⁴ which may inhibit or prevent wound healing. The topical application of CCC abolished the undesirable hemagglutinating and inflammatory effects of one or more components of microbial and non-microbial origin present in wound exudates and thereby promoted healing.¹⁵ Finally, CCC inhibited staphylococcal coagulase-induced clotting that otherwise may result in fibrin-coated bacteria which subsequently resist phagocytosis.¹⁶

Another approach taken for studying the cell regeneration activity of chlorophyll derivatives was to study the effect of these substances on formed blood elements. The administration of these agents alone or with iron-containing compounds, stimulated the production of hemoglobin and erythrocytes in anemic animals.¹⁷ Anemic rabbits fed a regular diet supplemented with chlorophyll derivatives recovered after 14 days, compared to 23 days for the controls.¹⁸ Other studies in anemic animals treated with CCC (0.025 g/kg, intravenous or 0.05 g/kg, by mouth)¹⁹ or with different chlorophyll derivatives (0.05 mg/kg, subcutaneously)²⁰ showed a 70.5 to 83 percent increase in erythrocytes and normalization of hemoglobin levels in 10 to 16 days. Oil-soluble as well as water-soluble chlorophyll derivatives exhibited antianemic effects.²¹ Chlorophyll-iron complexes have been especially successful in managing anemic animals.²² The utility of chlorophyll derivatives for treating various anemias also was described by other workers,²³ although it should be noted that in one study, these substances were ineffective.²⁴ In addition to erythrocytes, the regeneration of other blood cells can be stimulated by these substances. Thus, chlorophyll derivatives administered intraperitoneally reversed or prevented chemical and x-ray-induced leukopenia in several animal models.^{25,26}

Moreover, the regenerative and protective properties of chlorophyll derivatives were further substantiated by observing the effect of these substances on some internal organs. Thus, orally administered CCC-containing preparations showed antiulcer activities in animals.²⁷ Also, chlorophyll derivatives protected against carbon tetrachloride-induced liver damage in animals.²⁸ Finally, in in vivo models, these agents increased oxygen consumption, which is an indicator of cell regeneration.²⁹

The potential of chlorophyll derivatives, particularly CCC, for therapeutic use, initiated toxicological studies on the latter. Thus, rabbits, dogs, cats, guinea pigs, rats, and mice were administered CCC by various routes. The doses, ranging from 100 to 300 mg daily, were given for periods of from five to eight days depending on the animal. At all of the doses administered, no animals were found to exhibit signs of toxicity, thereby attesting to the safety of CCC.³⁰ In mice the LD₅₀ (lethal dose) values for CCC were: 285 mg/kg intravenously, 400 mg/kg intraperitoneally (ip), and 10 g/kg by mouth.³¹ Harrison and colleagues using Swiss male mice reported the following acute toxicity data: LD₅₀, 7 g/kg by mouth (LD₀, 5 g/kg and LD₁₀₀, 12 g/kg) and 0.19 g/kg ip (LD₀, 0.13 g/kg and LD₁₀₀, 0.32 g/kg).³² Moreover, during a ten-day period, Sprague-Dawley rats ingested a total of 10.2 g and 13.4 g of CCC, respectively, with no deaths observed (LD₀, 50 g/kg). These results point up the fact that CCC is an extremely safe substance from an acute and chronic toxicity point of view.

CLINICAL STUDIES

Wound healing. The cell regeneration effects of CCC in tissue culture and animal model studies, its influence on wound healing retardation factors, and its apparent lack of toxic properties led to clinical investigations which started actively in the United States in 1940. Ointments and solutions containing chlorophyll derivatives, including CCC*, were found to promote wound healing and to reduce malodors in various types of suppurative lesions.³³ In more than 400 hospital cases of suppurative disease, the topical application of CCC stimulated granulation tissue and epithelization better than several other agents.³⁴ Numerous clinical cases of chronic, refractory skin lesions, mainly dermal ulcers which failed to respond to conventional therapy, were treated successfully with CCC.³⁵ Marked improvement and healing following CCC therapy, with relief of itching and burning, were reported in various types of dermatological cases as well as in burns.^{36,37} Indeed, numerous clinical studies have demonstrated the potential of CCC as a tissue stimulant and wound healing agent in managing a wide variety of burns, dermatoses, and skin and gingival lesions.³⁸⁻⁴² Objective methods to evaluate the effectiveness of CCC using comparative therapy with other agents in patients with bilateral lesions demonstrated CCC to be the wound-healing drug of choice.⁴³ Only a few reports have failed to show a therapeutic effect for CCC in the wound-healing process,⁴⁴ with one study indicating that CCC at least tended to improve wound appearance.⁴⁵

Although CCC topical therapy generally gave acceptable clinical results, continued experience with CCC preparations revealed that some cases of especially chronic, slow-healing ulcers failed to respond satisfactorily.³³⁻⁴⁵ Further investigations showed that these recalcitrant lesions exhibited decreased vascularization due to capillary occlusion by agglutinated erythrocytes. In addition, the occurrence of densely collagenized

*Most of the clinical studies in the United States employed ointments containing 0.5 percent CCC in a water-washable base or aqueous solutions containing 0.2 percent CCC (Chloresium®, Rystan Co., Inc.)

fibrous tissue, together with toxic products from tissue breakdown and necrosis within the ulcer itself, led to incomplete healing with frequent reoccurrences of healed tissue breakdown.⁴⁶ Therefore, a novel topical preparation* was developed which contained CCC as an antiagglutinating and wound-healing agent, the proteolytic enzyme papain as a debriding agent, and urea to render necrotic tissue and wound debris more susceptible to papain breakdown. This formulation was more effective (86 percent complete healing) than either papain or CCC alone in treating slow-healing wounds.⁴⁶ Twenty-three of 24 patients⁴⁷ and 26 of 27 cases,⁴⁸ all involving various foul-smelling skin ulcers and suppurative wounds, were effectively managed and, in many cases, completely healed⁴⁷ with the papain-urea-CCC(PUC) ointment. Different types of chronically infected wounds, many of which did not respond to antimicrobial therapy, and/or surgical debridement were effectively treated with PUC therapy.^{49,50} Eradication of local infection and complete healing of chronic dermal ulcers were reported in 36 of 37 cases.⁴⁹ Application of PUC ointment in 18 of 22 cases of chronically infected wounds provided effective debridement prior to surgery, eliminated malodors, and avoided surgery in a few cases.⁵⁰ All these clinical reports indicated that the use of PUC ointment was safe, i.e. transient; mild local effects including burning, stinging, or itching were only rarely observed and generally did not warrant cessation of therapy, and were highly beneficial in managing slow-healing wounds complicated by necrosis and infection.

Internal Deodorization. In view of the many observations that CCC exhibited deodorizing effects as well as healed foul-smelling wounds, it was suggested that CCC might be helpful in controlling the odor problems of ostomy patients. Early reports showed that the deep insertion of chlorophyll derivatives by patients into their colostomies led to significant deodorization.⁵¹ Subsequently, it was shown in several studies that the oral administration of CCC** in doses of about 100 to 200 mg daily to colostomy patients, was sufficient to control malodors without undesirable side effects.⁵²⁻⁵⁴ Using the same dosage schedule, many studies also have been carried out on the use of CCC to control malodors in patients with urinary and fecal incontinence problems.⁵⁵⁻⁵⁸ Except for one study which employed low, daily oral doses of CCC over relatively short periods of time,⁵⁸ these reports generally afforded evidence that odors were reduced markedly in about one week and continued treatment maintained good control consistently. CCC has been classified as being generally recognized as safe and effective as an internal deodorant by the U.S. Food and Drug Administration.⁵⁹

MODE OF ACTION

The exact mechanisms whereby chlorophyll derivatives promote wound healing are not fully understood. Some possibilities include: a) the stimulation of protein synthesis²⁰ in a manner similar to that known for

heme⁶⁰ and subsequent cell regeneration^{2,3,12} with concomitant increased oxygen uptake;²⁹ and b) antimicrobial effects and/or direct neutralizing effects on toxins as well as other wound-healing retarding compounds present in wound exudates.^{9-16, 61-68} Various mechanisms have been suggested to explain the deodorizing effect of chlorophyll derivatives. Thus, the absorptive properties of these substances for odorous compounds have been reported.⁶⁴ Chlorophyll derivatives were found to tightly bind and immobilize odorous microbial indolic compounds.⁶⁵ Also, these chlorophyll derivatives may induce metabolic changes in odor-causing microorganisms. For example, *P. vulgaris* grown in the presence of these agents produced lesser than normal amounts of hydrogen sulfide, ammonia, and methyl indole compounds.^{66,67} It is tempting to speculate that at least one common general underlying molecular mechanism may account for the biological activities of chlorophyll derivatives. This mechanism may involve the affinity of these substances to form complexes with proteins. As a result, the normal biological activities of the complexed proteins are altered.

NEW AREAS OF APPLICATION

This review deals mainly with the use of chlorophyll derivatives as wound healing and deodorization agents. However, studies carried out in the last decade have suggested that new medical applications may be developed for these substances. For example, since several different enzymatic reactions were influenced by chlorophyll derivatives,^{68,69} these agents were evaluated for treating experimental pancreatitis^{70,71} which involves pathological changes induced by certain enzymes. The preclinical results were promising, and a few clinical studies have shown that chlorophyll derivatives may be useful in treating pancreatitis.⁷²

Of great interest are reported studies on the antimutagenic effects of chlorophyll derivatives and plant extracts rich in chlorophyll. These preparations have demonstrated most activity against several carcinogens in the Ames Salmonella/mammalian microsome test as well as in other test systems.^{73,74} If further investigations confirm that chlorophyll and its derivatives possess antimutagenic and/or anticancer properties, the inclusion of these agents in the human diet may provide a modicum of protection against cancer disease. Also, new attempts to investigate the action of chlorophyll derivatives on formed blood elements have been undertaken. Thus, orally administered, these substances were used successfully to increase the number of leukocytes in children suffering from leukopenia due to various causes. In some cases, these agents prevented leukopenia and, also, in combination with standard therapy, gave better results in treating thrombocytopenia of various origins than those obtained with the standard therapy alone.^{75,76}

A new technique, photodynamic therapy (PDT), was recently introduced to treat cancer disease. It includes the parenteral administration of selected photosensitizing porphyrins, for example, hematoporphyrin derivative (HPD), to patients, followed by the application of long wavelength light to the area of tumor growth. This procedure results in the generation of singlet oxygen in the photosensitized cancer cells and

*Ten percent papain, 10 percent urea, and 0.5 percent CCC in a water-washable base (Panafil® Ointment, Rystan Co., Inc.).

**Tablets containing 100 mg CCC (Derifil®, Rystan Co., Inc.).

subsequent photodestruction of tumors.⁷⁷ PDT also may be useful for treating psoriasis,⁷⁸ atherosclerosis,⁷⁹ and certain infections.⁸⁰ Preclinical PDT studies using different chlorophyll derivatives have shown that these substances are active antitumor photosensitizers^{81,82} and may prove to be better clinical candidates for PDT than HPD.

Chlorophyll derivatives also have been found to display immunological⁸³ and antioxidant⁸⁴ activities, but the practical application of these properties has not yet been developed.

CONCLUSIONS

Although one chlorophyll derivative, CCC, is enjoying an ever-increasing level of use as an internal deodorant, the wound-healing application of these substances, particularly to treat pressure sores and other skin ulcers, seems to have been neglected during the past 25 years. One possible explanation for this occurrence may be that much of the knowledge about the therapeutic applications of chlorophyll derivatives was forgotten because of the introduction in the 1960s of potent anti-inflammatory steroids and antimicrobial products intended for topical use (although steroids actually inhibit wound healing). Indeed, the management of patients with slow-healing wounds still presents problems today because the treatment is expensive and the rehabilitation time is prolonged.⁸⁵

Based on many published reports on the wound healing properties of CCC and other chlorophyll derivatives, as well as a consideration of the relatively low cost of these substances, it now would seem to be an opportune time to take a new clinical look at these neglected medicinal agents. Biological and chemical studies on chlorophyll derivatives, aimed at some of the new areas of applications (anticancer, antiatherosclerosis, and antipsoriasis), currently are underway in several laboratories worldwide. One can anticipate new and important results relative to this interesting group of natural substances.

DOCTORS' BILL

The "collateral source" bill passed by the New Jersey Legislature and signed into law by Governor Kean is a significant victory in the Exchange's efforts to reform the medical malpractice legal system. The Exchange provided the leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. Elimination of some costly inequities in our tort system will help moderate the ever-increasing severity of insurance losses.

LEADERSHIP IN SUPPORT OF MEDICINE

**Medical Inter-Insurance
Exchange of New Jersey**

Trustees' Minutes June 12, 1988

A regular meeting of the Board of Trustees was held on June 12, 1988, at the Executive Offices in Lawrenceville. Detailed minutes are on file with the secretary of your county society. A summary of significant actions follows:

Report of the President . . .

(1) Task Force on the Shortage of Nurses and Technical Personnel . . . Heard that a task force to address this problem is being appointed.

(2) Ad Hoc Committee on Graduates of Non-U.S. Medical Schools . . . Noted that Elmar G. Lutz, M.D., will serve as chairman of the Ad Hoc Committee on Graduates of Non-U.S. Medical Schools.

(3) Senior Medical Courtesy Programs . . . Requested reports on the status of county society participation in senior medical courtesy programs.

(4) Task Force on AIDS . . . Noted a meeting of the Task Force will be held on September 28, 1988, at MSNJ headquarters for all interested persons.

(5) Accountability of Claim Review Workers . . . Noted that a letter

was sent to the SBME indicating that the Society firmly believes third-party payors, when making determinations regarding the medical necessity of diagnostic tests, hospital admissions, and medical procedures, should be held accountable to the same standards as are treating physicians.

(6) Medical Inter-Insurance Exchange of New Jersey Workshop . . . Noted that Drs. Formica and Mineur are investigating the possibility of a weekend retreat to enlighten members of the Board, and presidents and presidents-elect of county and specialty societies about MIIENJ.

(7) Joint Executive Committee Meeting with NJHA . . . Noted that a joint meeting of the executive committees of MSNJ and NJHA will be on September 28, 1988.

(8) Ad Hoc Committee on Women in Medicine . . . Noted that Patricia G. Klein, M.D., will chair the Ad Hoc Committee on Women in Medicine.

Report of Executive Director . . .

(1) MSNJ Paid Membership . . . Noted that 7,156 members have paid 1988 dues.

(2) MSNJ Financial Statements . . . Reviewed and approved MSNJ's financial statements for the period ending April 30, 1988.

(3) Medical Discipline Matters . . . Heard that a legislative bill probably will be available toward the end of the summer on medical discipline.

(4) Legislative Matters . . . Noted the following positions on legislation: S-216—Chiropractic Board, opposition; S-734—Financial Disclosure, support; S-1208—Social Work, active opposition; A-470—DRG Study Commission, support; S-263—Statute of Limitations and S-1845—Structures in Payments in Tort Actions, active support; No-Fault, MSNJ is attempting to keep a fixed fee schedule out of any proposed legislation; and Reimbursement for Completion of Insurance Claim Forms, supported the suggestion that the Board direct a letter to the Departments of Insurance and Labor indicating that requests for medical reports are additional matters for which the physician is entitled to reasonable compensation.

Report of Legal Counsel . . .

(1) Resolution #7—Confidentiality of Medical Information; Resolution #8—Unauthorized Release of

Medical Information . . . Condensed both versions of these bills, as suggested by legal counsel, and directed that it be referred to the Judicial Council for review; revision version reads as follows:

Medical information should be considered a confidential communication between the patient and his physician. A patient's medical information should not be given to others without the expressed authorization of the patient, except for reports required by law, instances of medical emergencies, or when there is imminent danger to others. All physicians are advised that for medical-legal reasons, it is prudent to secure written documentation of the patient's authorization.

(2) Resolution #11—Telephone Information . . . Referred the following statement suggested by legal counsel to the Judicial Council:

Except when required by law, or in medical emergencies, or when there is imminent danger to others, it is unethical and improper for a physician to release patient information over the telephone to third parties unless the patient or his duly authorized representative has provided written consent to the release.

UMDNJ Report . . . Noted the following from Dr. Bergen's monthly report: more than 700 advanced degrees and certificates were conferred at the 15th annual commencement of UMDNJ; reviews of Robert Wood Johnson Medical School and New Jersey Medical School by the AMA have been completed successfully; salaries and benefits for nurses at University Hospital have increased recently in an effort to retain current staff and aid in the recruitment of new members; and an exhibit highlighting pioneer women in medicine is on display at the George F. Smith Library.

NJ Hospital Association . . . Noted the following from Mr. Scibetta's report: chairman of the NJHA Annual Meeting was Mr. Kenneth M. Coury, and Governor Kean was an honored guest; opposition by the Association to A-267—Pharmacy (prohibiting institutions from operating retail pharmacies within 1,500 feet of their facility) and support for A-472—Certificate of Need (CON) (provides exemption from CON requirements when a hospital and two or more physicians joint venture a project costing less than \$2 million); no physicians had been appointed

to the Hospital Association's Task Force on AIDS; and in the article in *New England Journal of Medicine* indicating that the mortality rate is measurably greater in states having higher levels of medical regulation, New Jersey was not included in the statistics.

Council on Public Health . . .

(1) Seminar on Counseling HIV Positive Patients . . . Approved and referred the following recommendation to the Task Force on AIDS for input and implementation:

That the Medical Society of New Jersey sponsor another educational seminar for physicians on AIDS, part of which is to specifically pertain to counseling patients who are HIV positive.

(2) Eye Health Screening Program . . . Approved the following recommendations:

That the Eye Health Screening Program be conducted only at hospital locations, mobile units operated by the New Jersey Commission for the Blind and Visually Impaired, and certain New Jersey Department of Health sites which will not benefit private entrepreneurs.

That the Eye Health Screening Program be medically oriented, and that it be conducted only by ophthalmologists.

Upcoming Events Regarding the National Study of Resource-Based Relative Value Scales for Physician Services . . . Received a report from the AMA on the resource-based relative value scale study.

AMA Response to the Nursing Shortage-Registered Care Technologists . . . Voted to refer the AMA report to MSNJ's Task Force on the Shortage of Nurses and Technical Personnel.

JEMPAC . . .

(1) Auxiliary Input . . . Noted Dr. Ryan's thanks to the Auxiliary for their help in defining the AMA position on certain aspects of the recently enacted Catastrophic Extension of Medicare.

(2) Board Meeting . . . Noted the next meeting will be on June 22, 1988; it is an open meeting.

Unfinished Business . . .

(1) Ex Officio Seat on Board of Trustees . . . Noted that the following recommendation was not adopted:

That the Speaker of the House of Delegates be given a nonvoting, ex-officio seat on the Board of Trustees.

New Business . . .

(1) Article in the Newark Star-Ledger . . . Noted that the president will respond to an article in the newspaper stating that "AIDS victims are not deserving of compassion because most are drug addicts and homosexual men."

(2) Medicare Disputes . . . Advised Dr. Barry R. Zitomer, president of the New Jersey Society of Internal Medicine that his concerns about Medicare should be addressed to the Council on Medical Services.

(3) Patient Lawsuits Publicized in Newspapers . . . Noted that there is little a physician can do about newspaper reports dealing with physicians being sued by patients.

(4) Selection Criteria for AMA Delegates and Alternates . . . Did not adopt the following recommendations proposed by Dr. Robinson:

That alternate delegates to the AMA should be actively practicing members of the Medical Society of New Jersey who are no older than 55 years of age when first elected to that post.

That delegates to the AMA should be actively practicing members of the Medical Society of New Jersey when first elected to that post; and that they not be eligible for re-election, if retired, unless they hold a chairmanship of a standing committee of the AMA, or have become an officer of the AMA.

Correspondence . . .

(1) Hospital Rates/Nursing Shortage . . . Noted the Hospital Rate-Setting Commission approved an 11.072 percent increase in reimbursement for labor costs; also, a 13-member Nursing Shortage Study Commission soon will make recommendations to meet the current nursing shortage crisis.

(2) Shortages: Nursing/Allied Health Technology . . . Noted MSNJ's letter regarding manpower shortage was referred to Dr. Molly Joel Coye; she is awaiting results of the Nursing Shortage Study Commission.

(3) State Board of Medical Examiners: Third-Party Payors . . . Noted a letter from Dr. Frank Malta, President of the SBME, advising that the final determination for the appropriateness of care is a physician, not a nonphysician reviewer.

UMDNJ Notes

**Stanley S. Bergen, Jr., M.D.
President**

For the second time in six months, the Center for Fertility and Reproductive Medicine at our Newark campus announced a breakthrough birth. This time the miracle resulted from a frozen embryo produced from a donated egg. It was the first known birth of its kind in the northeast United States and was among less than ten births worldwide.

Last March, University Hospital-based specialists announced the first known birth in the northeast of a baby conceived with a donor egg, a procedure that advanced yet another step of the use of the frozen embryo. In both cases, the women could not conceive due to premature ovarian failure.

In the recent case, the woman's sister donated several eggs which were fertilized in vitro with sperm from the woman's husband. An initial attempt at pregnancy failed, and the extra embryos were frozen for future use. It was a frozen embryo, thawed three months later and then implanted, that produced the new baby.

According to Center experts, this achievement with frozen embryos used techniques originally developed in the field of animal husbandry. At a certain stage of development—when the embryo either is one cell or has divided into two or four—it is dehydrated with the chemical cryoprotectant. The temperature then slowly is decreased to -190 degrees centigrade.

The embryo is placed in a thin, sealed cylinder that is stored in a container of liquid nitrogen. Then, to prepare for implanting, the embryo is thawed to room temperature and water is gradually added for rehydration. Unfertilized eggs cannot be frozen as they are too fragile to withstand the process.

Our Center has developed the combined use of two innovative procedures to retrieve eggs from the donor and to prepare the recipient to nurture a pregnancy. The program, which uses only volunteer donors who receive no payment, offers hope to women with ovarian failure or those born without ovaries.

Dr. Gerson Weiss, professor and chairman of the department and

an internationally renowned reproductive endocrinologist, assembled the team after he was recruited to the medical school two years ago as part of UMDNJ's plan to become one of the top 25 academic health centers in the country.

A model program for the evaluation, treatment, and prevention of child sexual abuse has been launched by UMDNJ's Robert Wood Johnson Medical School through a three-year, \$376,000 grant from the Robert Wood Johnson Foundation. Called "The Family Relations Project," it also is supported by the UMDNJ-Community Mental Health Center and the New Jersey Division of Youth and Family Services (DYFS), bringing total funding to approximately \$600,000.

The goal of the program, according to Dr. Raymond Rosen, professor of psychiatry, is to achieve a unified approach that brings together medical, social, and legal agencies to address the problem. The program is based at 85 Bayard Street in New Brunswick.

Child sexual abuse is not limited to any economic, racial, or ethnic group. The National Center for Child Abuse and Neglect estimates the incidence of child sexual abuse at 800 to 1,000 cases per million. A Canadian national survey showed that by the time a child reaches the age of 17, 9 percent of boys and 22 percent of girls have been the victim of a sexual assault. Between 15 and 18 percent of victims are five years old or younger. In 1985, 4,497 such cases were reported in New Jersey. But Dr. Rosen called that a serious underestimate because it is believed that victims reporting to authorities represent only 5 to 10 percent of the total number of cases.

Since the problem is viewed as many-sided, counseling is provided to all members of the family. Moreover, families will be followed for years in order to reduce recidivism rates.

Dr. Robert Johnson, director of adolescent medicine at the Newark-based New Jersey Medical School, has been appointed to the Governor's Council on the Prevention of Mental Retardation and Developmental Disabilities. The physician, a UMDNJ alumnus who has emerged as a national leader in the growing field of adolescent medicine, also was declared "citizen of the year" by

the New Jersey State Council of Black Social Workers.

John Kostis, M.D., chief of the Division of Cardiovascular Diseases at the Piscataway-based Robert Wood Johnson Medical School, has been named occupant of the Detwiler Chair in Cardiology at the New Brunswick-based school.

Joseph A. Liebermann III, M.D., professor and chairman of family medicine at the Robert Wood Johnson Medical School, is one of six recipients in the nation of a Robert Wood Johnson Health Policy Fellowship. The fellowship involves a one-year program of orientation and working experience in Washington, D.C. to teach leadership roles to faculty members.

AMNJ Report

Benjamin F. Rush, Jr., M.D.

The Academy of Medicine's Annual Awards Dinner held on May 25, 1988, at the Chanticleer in Short Hills was a major success. Approximately 260 guests gathered to honor our Award recipients and help install our new officers for 1988-1989.

Our Edward J. Ill award recipient, Dr. Richard C. Reynolds of Princeton and our Citizen's Award designee, Assembly Speaker Chuck Hardwick of Westfield were both eloquent in their responses. Dr. James S. Todd of Ridgewood, senior deputy executive vice-president of the AMA, was elected an Honorary Fellow of the Academy and became only the sixth such awardee in our history.

The Awards Committee, under the chairmanship of immediate past-president Tony Minnefor, presently is soliciting nominations for 1989. The deadline for receiving nominations has been moved to September 6, 1988.

New AMNJ officers for 1988-1989 elected at the Annual Awards Dinner were President, Benjamin F. Rush, Jr., M.D.; President-Elect, Frederick B. Cohen, M.D.; 1st Vice-President, Blackwell Sawyer, Jr., M.D.; 2nd Vice-President, George L. Triebnacher, M.D.; Secretary, Gerald Shapiro, M.D.; and Treasurer, Stanley Bresticker, M.D.

The Academy's staff is actively preparing the Annual Calendar for 1988-1989, which is our major CME publication. The calendar will include around 600 CME activities for

the forthcoming academic year and represents about half of the total number of programs we will sponsor and jointly sponsor for the year.

The calendar includes many other items of interest, including a list of available roving symposia topics, an application to participate in our Speakers Bureau, and a list of affiliated specialty societies and their presidents.

A multidisciplinary head and neck oncology section has been formed within the Academy. At an organizational meeting held on May 17, 1988, Dr. Harvey Yeager was elected chairman and Dr. Andrew Zablow was elected Secretary. The first scientific meeting of the group will be held on Thursday evening, September 15, 1988, at the Manor in West Orange.

The New Jersey Physicians Golf Association's summer events included a July 20th tournament at the Knickerbocker Country Club and an August 9 event at the Baltusrol Golf Club.

Pioneer Women Physicians

Tribute is being paid to pioneer women physicians of New Jersey in an exhibit by the University Libraries of UMDNJ. The show is in the exhibition gallery of the George F. Smith Library of the Health Sciences on the Newark campus.

Twenty pioneer women physicians are featured in the display which officially opened on June 2, with a reception honoring Dr. Palma Formica, the first woman president of the Medical Society of New Jersey.

In addition to Dr. Formica, five other living "pioneers" attended the opening:

- Dr. Eva T. Brodtkin, first woman dermatologist in New Jersey and the first woman president of the Dermatological Society of New Jersey.

- Dr. Christine Haycock, the first woman to transfer from the U.S. Army Nurse Corps to the U.S. Army Medical Corps. Dr. Haycock was the first woman to head a major U.S. Army Reserve Unit in the state.

- Dr. E. Mae McConnell, the first black appointed to the staff of Newark City Hospital and former president of the New Jersey State Medical Association.

- Dr. Laura Morrow, of Clifton,

president of the New Jersey Psychiatric Association and former president of the American Medical Women's Association.

- Dr. Mathilda Vaschak, the first woman medical director of a corporation in New Jersey, and the first woman chairman of the Occupational Medical Society of New Jersey.

There are 13 additional women physicians, including:

- Dr. Sarah F. Mackintosh (1836-1903), the first woman member of the Passaic County Medical Society, who in 1874 became the first woman member of the Medical Society of New Jersey.

- Dr. Dorothy K. Klughaupt (1909-1976), the first woman president of the Passaic County Medical Society; she was the first woman president of the Passaic General Hospital Staff.

- Dr. Mary J. Dunlap, the first woman president of the Association of Medical Officers of American Institutions for Feeble-Minded Per-

sons, now the American Association for Mental Retardation. In 1904, Dr. Dunlap was elected the first woman president of the Cumberland County District Medical Society. She was the first woman to be president of a county medical society in New Jersey.

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ANESTHESIOLOGY—Kenneth Lum, M.D., 7240 Twin Eagle Lane, Fort Myers, FL 33912. Downstate 1985. Board eligible. Available.

CARDIOLOGY—Donald G. Rubenstein, M.D., 1037 3rd St., #303, Santa

Monica, CA 90403. Louisiana 1980. Board eligible. Group or partnership. Available.

DERMATOLOGY—Cheryl S. Citron, M.D., 885 Sussex Rd., San Marino, CA 91108. Miami 1984. Board eligible. Group, partnership, solo. Available.

ENDOCRINOLOGY—Robert P. Castellucci, M.D., 3509 Kensington Ave., #3, Richmond, VA 23221. St. George's 1982. Board eligible. Partnership or group. Available September 1988.

FAMILY MEDICINE—John Travers, M.D., 14225 Kendra Way, Poway, CA 92064. UMDNJ 1982. Group or HMO. Available.

INTERNAL MEDICINE—Marc Hanfling, D.O., 26 Glen Lane, Cherry Hill, NJ 08002. New York College 1981. Also, cardiology. Board certified. Board eligible (CARD). Group, partnership, solo. Available.

Lalitha B. Iyer, M.D., 84 Hempstead Dr., Somerset, NJ 08873. Madras (India) 1980. Board eligible. Group, partnership, emergency room. Available.

Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buffalo 1982. Board eligible. Board certified (PED). Also, pediatrics. Group, partnership, academic. Available October 1988.

PEDIATRICS—Linda York-Chance, M.D., 435 East 70th St., New York, NY 10021. Connecticut 1985. Board eligible. Clinic or emergency room. Available.

Iraj Modarai, M.D., 40 Cherry Hill, Springfield, VT 05156. Tabriz (Iran) 1956; Polyclinic 1963. Board certified. Clinic, emergency, salary. Available.

Joseph T. Wayne, M.D., 106 Elmwood Dr., Prudenville, MI 48651. SUNY-Buffalo 1982. Also, internal medicine. Board certified. Board eligible (IM). Group, partnership, academic. Available.

PHYSICAL MEDICINE AND REHABILITATION—Robert B. Thorne, M.D., 1219 East Northern Pkwy., Baltimore, MD 21239. Rutgers 1980. Board certified. Available.

PSYCHIATRY—Jozsef Telkes, M.D., c/o John Black, 3901 Crosswicks-Hamilton Square Rd., Robbinsville, NJ 08691. Pecs (Hungary) 1978. Board certified. Group or research. Available September 1988.

SURGERY—Andrea Resciniti, M.D., 4 Duncannon Ave., Apt. 9, Worcester, MA 01604. Hahnemann 1983. Board eligible. HMO, multispecialty, group, single specialty group. Available.

UROLOGY—Joseph G. Colonna, M.D., 503 Captain Dement Dr., Waldorf, MD 20601. Guadalajara 1977. Board certified. Group, partnership, solo. Available.

“He flourished during the first half of the 20th century.”

The American physician isn't extinct. But your freedom to practice *is* endangered. Increasing government intervention is threatening the quality of medicine—and your right to function as an independent professional. The government, responding to cost containment pressures from myriad sources, has taken a more active role in legislating reimbursement methods, payment levels and even access to care.

In your fight for survival, the American Medical Association is your best weapon. The AMA is the most influential force in health care. No other organization can so effectively reach the national policymakers who will help determine your future and the future of medicine.

Join the AMA. We're your voice in Washington. And we're fighting for you—and your patients.

For more information, call the AMA collect (312) 645-4783, or return this coupon to your state or county society.

LETTERS TO THE EDITOR

A Feasible Solution

Dear Doctor Slobodien:

I am writing this letter in response to an article by Arthur Bernstein, M.D., which appeared in your March 1988 issue. Dr. Bernstein concludes his article, "A Feasible Solution," with the statement, "The answer with which we are left is a well-planned relative value scale agreed upon by all concerned."

On the surface this appears to be an ideal solution to the problem of physician reimbursement. It is, however, a naive comment since there is no way in which "all concerned" will agree with any relative value scale. The reason for this is that there is obvious competition on the part of nonsurgical practitioners to increase the rate at which they are paid relative to that of surgical practitioners. This ideally could be done either by raising the fees of nonsurgeons or lowering the fees of surgeons. What actually will happen is the differential in reimbursement for surgical versus nonsurgical services may be reduced; it will be accomplished by lowering reimbursement for all services. Any such proposal offered by physicians to the government will thus be a disastrous one because the government is interested mainly in cost containment and only secondarily, if at all, in quality of care. What will happen is the government will adopt all cost-

saving measures that are offered. An example is the offer of ophthalmologists to accept a decrease in reimbursement for preoperative cataract ultrasound examinations as opposed to taking a cut in the allowance for the surgery. The government not only cut the allowance for surgery, but seized upon the novel idea offered by the ophthalmologists and combined the surgical fee cut with a cut in reimbursement for ultrasound examination.

Based on past performance, we can expect that any attempt to decrease the gap between reimbursement for surgical and nonsurgical procedures will result in less reimbursement for all procedures and no one in the medical profession will gain.

Another unrelated point I wish to raise is the approach that the Medical Society should take with respect to mandatory Medicare assignment. We can be certain that in some shape or way this will be with us in years to come. Both of the leading candidates for the Democratic presidential nomination are strongly in favor of mandatory assignment. Mr. Dukakis signed into law the first such proposal and Governor Cuomo has come out strongly in favor of a similar plan. I feel the only way we can have something which will be at least partially acceptable would be for the Medical Society of New Jersey to propose a mandatory assignment program based on a means test. I propose that any person on Medicare who qualifies for the New Jersey Pharmaceutical Assistance to the Aged and Disabled Program (PAAD) not be charged for medical services and that the physicians accept Medicare assignment. This would produce little if any hardship on physicians since I am certain that practically all of us accept assignment on a voluntary basis for patients with limited means.

There is no reason for physicians to have to accept assignment on persons who can afford to pay. If the Medicare program is short on funds and the government wishes to limit the amount they wish to pay for a given procedure, it will not save the government additional money if doctors' fees are limited. I have, to date, not heard of any plan by the government to insist that the reduction in fees forced upon physicians for Medicare patients are being pro-

posed in any similar manner for other professions or businesses. I do not think the government is yet ready to tell Lee Iacocca that he must give 30 percent discounts to senior citizens who purchase his automobiles. The telephone company has not been ordered to provide mandatory discounts to senior citizens. I am certain that Prudential Insurance Company is not giving 30 percent discounts to senior citizens.

(signed) Marvin F. Kraushar, M.D.

Dear Doctor Kraushar:

You insist that the idea of a "relative value scale" agreed upon by all concerned, is a "naive comment." At the present time, there has been agreement by the AMA, as well as the specialty societies, with the work presented to date.

I am not naive enough to believe that every physician will be happy with the scale presented for his specialty, but when a majority do agree, then that is the democratic way to settle this matter.

The California relative value scale was an effective fee scale for many years, though I am certain it had some inequities as does any fee scale, including so-called "fee for service" (unrestricted) which I must assume you favor. As I tried to point out, the patients no longer will stand for a "get-as-much-as-possible" fee schedule for medical care. So the wise man bows to the will of the people and makes the necessary accommodations, as all the specialty societies and the AMA have done.

I am as opposed to regimentation as you obviously are, but there comes a time where the reputation of the physician as a caring healer preempts the need for unrestricted fees. The public feels, correctly or incorrectly, that we are gouging them by our fees. This concept must be altered or we will never regain our status as the patient's advocate. At the moment, the relative value scale as it is being set up seems to be a valid methodology.

As for "mandatory assignment," I agree with you fully!

(signed) Arthur Bernstein, M.D.

Editor's Note: MSNJ sponsors a senior medical courtesy program, as discussed in the May 1988 issue of *NEW JERSEY MEDICINE* (p. 352).

Allergic Diseases from Infancy to Adulthood; Annual Review of Medicine; Evaluation of Isokinetic Equipment; Human Inflammatory Diseases

Allergic Diseases from Infancy to Adulthood. Second Edition.

C. Warren Bierman, M.D., and David S. Pearlman, M.D. Philadelphia, PA, W.B. Saunders Company, 1988. Pp. 848. (\$95)

Allergic Diseases From Infancy to Adulthood is the second edition of a textbook which previously had concerned itself with allergic problems in infants and children. It now has been extended to include adult allergic disease. The authors have enlisted the aid of some of the outstanding researchers and writers in the field of allergy and clinical immunology and have concentrated on clinical management.

The first two sections are devoted to basic physiology and pathology and are excellent reviews. Particularly outstanding is the section on host-defense systems and cytokines. Any physician or upper-level medical student would find this, by itself, a well-written monograph on current concepts in clinical immunopathology.

The outstanding chapters on clinical allergy are: adverse reactions to foods (John Anderson); identification of pollen and fungus allergens (William Solomon); atopic

dematitis, and a clinical review of upper respiratory tract diseases.

The only weak link in the text is the section on urticaria. The chapters on pharmacologic management are good, but there is too much emphasis on theophylline and not enough detail on corticosteroid therapy.

In summary, I found this to be a scholarly, well-written text; and although the author recommends this book for the practicing physician, it would be worthwhile for the allergy specialist as well.

Donald G. McKaba, M.D.

Annual Review of Medicine: Selected Topics in the Clinical Sciences

William P. Creger (ed). Palo Alto, CA, Annual Review, Inc., 1988. (\$34)

The Annual Reviews, Inc., is a nonprofit scientific publisher established to promote the advancement of sciences. Since 1932, the company has pursued (as its principal function) the publication of high-quality, reasonably priced annual review volumes. These books are organized by editors and editorial committees who invite qualified authors to contribute critical articles of significant developments within each major scientific discipline.

This 39th volume of the *Annual Review of Medicine* contains 42 articles on as many various subjects covering medical illnesses, diagnoses, and therapies. Each article starts with an abstract paragraph, followed by a detailed description and discussion of the subject matter, and a final summary conclusion. Each essay is easily read, and heavily annotated with the most recent references and subject indices. Each volume published has a cumulative index of the previous five volumes by author and chapter titles.

The *Annual Review of Medicine* will find itself most frequently used or referred to in a library reference section, in hospitals, schools, or other health service facilities. It has good value as a time saver.

Harry M. Poppick, M.D.

Evaluation of Isokinetic Equipment

Terry R. Malone, Ed.D. (ed). Balti-

more, MD, Williams & Wilkins, 1988. Pp. 92.

This small book is designated as the first of a quarterly series of books on sports injury management. The aim is to acquaint the reader with various types of isokinetic rehabilitative equipment currently on the market, and it succeeds.

A detailed description, with illustrations, is given of six of the major systems in use. Advantages and disadvantages of this machinery are listed. A final chapter summarizes the data on the various equipment and makes suggestions for the newcomer, as well as points out that machinery is only one aspect of the rehabilitation process.

The book is a good reference text for personnel in all fields of physical medicine and orthopedics who might have reason to use or prescribe the use of isokinetic rehabilitative equipment.

Christine E. Haycock, M.D.

Human Inflammatory Diseases. Clinical Immunology. Volume I.

Gianni Marone, M.D., Lawrence M. Lichtenstein, M.D., Ph.D., Mario Condorelli, M.D., Anthony S. Fauci, M.D. Philadelphia, PA, B.C. Decker Inc., 1988. Pp. 327.

This volume represents the topics and discussions presented at the first Capri conference on clinical immunology held in the summer 1986. The text covers a wide spectrum of topics discussed in the four symposiums given at the conference including immunology of pulmonary disorders, cardiac immunology, adenosine metabolism and receptors, and basic immunologic and biochemical mechanisms involved in rheumatic disorders.

The text is an up-to-date, well-referenced text with many distinguished international authors including Anthony Fauci (vasculitis), Roberto Levi (cardiac anaphylaxis), Charles Cochrane (lung injury), Lawrence Lichtenstein (basophils and mast cells), John Stobo (antigen receptor complex), and Giovanni Camussi (platelet activating factor). The text is read easily and is appropriate for physicians interested in the basic science of inflammation associated with pulmonary, cardiac, autoimmune, and musculoskeletal systems.

Leonard Bielory, M.D.

ark. From 1955 to 1957, he served as a captain in the United States Army medical corps.

Dr. Walter H. Cole

Retired industrial medicine specialist Walter Horace Cole, M.D., of Elizabeth, died on April 13, 1988, at the age of 83. Born in Elizabeth and a life-long area resident, Dr. Cole received his medical degree at the University of Pennsylvania School of Medicine, Philadelphia, in 1929. He became affiliated with Elizabeth General Medical Center, St. Elizabeth Hospital, and Alexian Brothers Hospital, all in Elizabeth. Dr. Cole was a member of our Union County component and of the AMA. He received the Medical Society of New Jersey's Golden Merit Award in 1979, for 50 years of service as a physician.

Dr. Frederick C. DeTroia

Specialist in surgery and gynecology Frederick Carl DeTroia, M.D., died on February 24, 1988, at the age of 77. A Newark native, Dr. DeTroia was graduated from Jefferson Medical College, Philadelphia, Pennsylvania, in 1935. He maintained private practices in Newark and South Orange, and was affiliated with Saint Michael's Medical Center, Newark City Hospital, and Presbyterian Hospital, all in Newark; as well as Saint Barnabas Medical Center, Livingston. A fellow of the International College of Surgeons, Dr. DeTroia was a member of our Essex County component, of the Essex County Pathological Society, and of the AMA. During World War II, he was a major in the United States Air Force. In 1985, Dr. DeTroia received the Medical Society of New Jersey's Golden Merit Award, for 50 years of medical practice.

Dr. Allan A. Klein

Allan A. Klein, M.D., specialist in traumatology and general industrial surgery, died on July 22, 1987, at the age of 77. Born in Jersey City, Dr. Klein received his medical degree at New York Medical College, in 1933. He became affiliated with Christ Hospital and Jersey City Medical

Center, both in Jersey City; Paliades General Hospital, North Bergen; and the Englewood Hospital Association. Dr. Klein was a member of our Hudson County component. In 1983, he received the Golden Merit Award.

Dr. Leo Schwartz

Retired Passaic physician Leo Schwartz, M.D., died on May 4, 1988, at the age of 79. A native of New York City, Dr. Schwartz received his medical degree at the University of Arkansas Medical School, in 1935. He practiced medicine in Passaic for 40 years, and was a United States Army veteran of World War II. Dr. Schwartz was a member of our Passaic County component and of the AMA. In 1985, he received MSNJ's Golden Merit Award.

Dr. Salomon Silvera

Radiologist Salomon Silvera, M.D., died on March 3, 1988, at the age of 82. Born in Cairo, Egypt, Dr. Silvera received his medical degree from the University of Berlin, Germany, in 1929. He became affiliated with Christ Hospital, Jersey City, and UMDNJ-University Hospital, Newark. Dr. Silvera also maintained a private practice in Jersey City. A diplomate in radiology and a fellow of the American College of Radiology, Dr. Silvera was a member of our Hudson County component and of the AMA. During World War II, he was a major in the U.S. Army medical corps. He was a 1979 recipient of the Golden Merit Award.

Dr. David Wiener

Retired surgeon David Wiener, M.D., died on March 8, 1988, at the age of 76. Dr. Wiener attended Indiana University School of Medicine, receiving his medical degree in 1938. A fellow of the American College of Angiology and of the American College of Surgeons, Dr. Wiener was a member of our Essex County component and of the American Medical Association. He was affiliated with Clara Maass Medical Center, Belleville, and Newark Beth Israel Medical Center, among others. Dr. Wiener received MSNJ's Golden Merit Award in 1988.

***Drs. Austin; Carlin; Cole;
DeTroia; Klein; Schwartz;
Silvera; Wiener***

Dr. Thomas R. Austin

General practitioner Thomas Ralph Austin, M.D., died on April 30, 1988, at the age of 86. Dr. Austin attended Cornell University Medical College, New York, where he received his medical degree in 1932. He maintained a private practice in Cranford. During World War II, Dr. Austin served in the United States Army medical corps, attaining the rank of major. He was a member of our Union County component and of the AMA. In 1982, Dr. Austin received MSNJ's Golden Merit Award for his 50 years as a physician.

Dr. Daniel J. Carlin

Specialist in neurology and electroencephalography Daniel Joseph Carlin, M.D., died on April 25, 1988, at the age of 60. Born in Brooklyn, New York, Dr. Carlin received his medical degree from Galway National University of Ireland in 1954. A diplomate in neurology and a member of our Morris County component, Dr. Carlin was affiliated with Morristown Memorial Hospital, Summit; and UMDNJ-Robert Wood Johnson University Hospital, New-

AUTHOR INFORMATION

NEW JERSEY MEDICINE is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in NEW JERSEY MEDICINE is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

YOU CAN KEEP THEM IN BALANCE— YOUR FAMILY LIFE AND YOUR MEDICAL PRACTICE.

We'd like to help you spend more time with your family yet receive professional satisfaction from your medical practice. As a member of the Air Force health care team, you'll be able to participate in our group practice concept which will free you of most administrative duties.

Air Force benefits are also very attractive. You and your family will enjoy 30 days of vacation with pay each year plus many more Air Force advantages. Call

We're Proud To Salute the Nation's #1 Money Manager

Integrated Resources Asset Management

According to CDA Investment Technologies, Inc.*, Integrated Resources Asset Management (IRAM) was named the top-ranked money manager for the three year period ending December 1987.

All of us at Integrated Resources Equity Corporation would like to congratulate the IRAM team on a job well done. As the investment advisor for numerous institutional investors and individuals with port-

folios in excess of \$100,000, IRAM has built a reputation for being one of the country's most dependable and accessible money managers.

If, like so many other substantial investors, you're interested in having your portfolio professionally managed, stop by your local Integrated Resources Equity Corp. office and find out how you can put the nation's top-ranked money manager to work for you.

*Top-ranked U.S. money manager for the three year period ending December 1987 was Integrated Resources Asset Management Corp., based upon filings with the SEC. Filing data was analyzed by CDA Investment Technologies, Inc.

The appearance of advertising in NEW JERSEY MEDICINE is not a Medical Society of New Jersey guarantee or endorsement of the product or service, or the claims made for the product or service, by the advertiser. When MSNJ has endorsed a product or program, that will be expressly noted.

INTENSIVE CARE.

Your practice deserves nothing less. And the Medical/Dental Banking Group at Midlantic National Bank/North is uniquely prepared to deliver the kind you need.

Whether you're a third-year resident or long-established in practice, a personalized loan package may be the best prescription for your future. We know the funding needs of new practices, buy-ins, buy-outs and practice expansion may exceed the lending limits of most financing sources. This is why we finance creatively, based on an understanding of medical economics and a repayment plan based on anticipated practice growth rather than fixed schedules.

We speak your language in other areas as well, with practice and personal services such as checking, savings, trust and estate planning, IRAs, custodial accounts, and more.

If you're starting out, start with our free brochure, "The Beginning Physician's Guide to Financing a Practice." Beginner or not, we urge you to call Patrick Robinson, Vice President and Group Manager, toll-free at 1-800-633-0040.

We'd like to make a "house call," and show you how our intensive care can help your practice.

**"Medical training taught
me how to cure.
Senior Patient helps
me to care."**

Introducing a new "how to" publication for treating senior patients.

Senior Patient provides practical information designed to help you manage the care of your senior patients.

Its fresh approach in medical journalism presents short, easy-to-read, original articles on a broad range of subjects including emotions and coping, family relationships, death and dying, sleep disorders, community services, relations with institutions, and financial problems and their relation to health.

Each issue also offers "Pearls" from the personal experiences of other physicians, "Quick Currents" about what is happening in legislation relating to senior care, and an "Open Forum" in which readers can react and interact.

It's a concise, informative, "how to" approach in caring.

Senior Patient • 4530 W. 77th St. • Minneapolis, MN 55435 • (612) 835-3222

"The Power of the Pen"

When you decide to use Bactrim, use the power of the pen as well. Protect your prescribing decision in accordance with your state regulations to prevent substitution. It guarantees your patients will get the power of Bactrim.

REPRINTS AVAILABLE

NEW JERSEY MEDICINE is pleased to offer all contributors and interested persons reprints of material published in the state medical journal. If you desire reprints, please complete the form and submit with payment in full. Orders received one month after publication of an article will be charged an additional \$5 per page to cover the cost of re-making the film of the pages to be reprinted. An order will not be processed without payment in advance; a purchase order is not sufficient.

For otitis media

Illustration of Bactrim power in middle ear infection.

Bactrim Power

- Penetrates
- Concentrates
- Overpowers
- Persists

Bactrim concentrates in hard-to-reach infections¹ to overpower susceptible strains of *H. influenzae* and *S. pneumoniae* (*in vitro*)² year after year. B.i.d. dosing, cherry flavor and economy keep successful therapy within your power. Especially when you remember to protect your prescribing decision by specifying D.A.W.

In vitro results may not correlate with clinical results. Not indicated for prophylactic or prolonged use in otitis media and contraindicated in infants under two months of age.

Specify *"Dispense as written"*

BactrimTM Pediatric

(40 mg trimethoprim and 200 mg sulfamethoxazole per 5 mL)

Please see references and summary of product information on following page.

ROCHE

Specify "Dispense as Written," "Do Not Substitute," or "Brand Necessary" according to your state regulations.

Bactrim™

(trimethoprim and sulfamethoxazole/Roche)

Before prescribing, please consult complete product information, a summary of which follows:

CONTRAINDICATIONS: Hypersensitivity to trimethoprim or sulfonamides; documented megaloblastic anemia due to folate deficiency; pregnancy at term and during the nursing period; infants less than two months of age.

WARNINGS: FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS.

BACTRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. Clinical signs, such as rash, sore throat, fever, arthralgia, cough, shortness of breath, pallor, purpura or jaundice, may be early indications of serious reactions. In rare instances a skin rash may be followed by more severe reactions, such as Stevens-Johnson syndrome, toxic epidermal necrolysis, hepatic necrosis or serious blood disorder. Perform complete blood counts frequently. **BACTRIM SHOULD NOT BE USED IN THE TREATMENT OF STREPTOCOCCAL PHARYNGITIS.** Clinical studies show that patients with group A β -hemolytic streptococcal tonsillopharyngitis have a greater incidence of bacteriologic failure when treated with Bactrim than with penicillin.

PRECAUTIONS: General: Give with caution to patients with impaired renal or hepatic function, possible folate deficiency (e.g., elderly, chronic alcoholics, patients on anticonvulsants, with malabsorption syndrome, or in malnutrition states) and severe allergies or bronchial asthma. In glucose-6-phosphate dehydrogenase deficient individuals, hemolysis may occur, frequently dose-related.

Use in the Elderly: May be increased risk of severe adverse reactions in elderly, particularly with complicating conditions, e.g., impaired kidney and/or liver function, concomitant use of other drugs. Severe skin reactions, generalized bone marrow suppression (see WARNINGS AND ADVERSE REACTIONS) or a specific decrease in platelets (with or without purpura) are most frequently reported severe adverse reactions in elderly. In those concurrently receiving certain diuretics, primarily thiazides, increased incidence of thrombocytopenia with purpura reported. Make appropriate dosage adjustments for patients with impaired kidney function (see DOSAGE AND ADMINISTRATION).

Use in the Treatment of Pneumocystis Carinii Pneumonia in Patients with Acquired Immunodeficiency Syndrome (AIDS): AIDS patients may not tolerate or respond to Bactrim in same manner as non-AIDS patients. Incidence of side effects, particularly rash, fever, leukopenia, elevated aminotransferase (transaminase) values, with Bactrim in AIDS patients treated for *Pneumocystis carinii* pneumonia reported to be greatly increased compared with incidence normally associated with Bactrim in non-AIDS patients.

Information for Patients: Instruct patients to maintain adequate fluid intake to prevent crystalluria and stone formation.

Laboratory Tests: Perform complete blood counts frequently; if a significant reduction in the count of any formed blood element is noted, discontinue Bactrim. Perform urinalyses with careful microscopic examination and renal function tests during therapy, particularly for patients with impaired renal function.

Drug Interactions: In elderly patients concurrently receiving certain diuretics, primarily thiazides, an increased incidence of thrombocytopenia with purpura has been reported. Bactrim may prolong the prothrombin time in patients who are receiving the anticoagulant warfarin. Keep this in mind when Bactrim is given to patients already on anticoagulant therapy and reassess coagulation time. Bactrim may inhibit the hepatic metabolism of phenytoin. Given at a common clinical dosage, it increased the phenytoin half-life by 39% and decreased the phenytoin metabolic clearance rate by 27%. When giving these drugs concurrently, be alert for possible excessive phenytoin effect. Sulfonamides can displace methotrexate from plasma protein binding sites, thus increasing free methotrexate concentrations.

Drug/Laboratory Test Interactions: Bactrim, specifically the trimethoprim component, can interfere with a serum methotrexate assay as determined by the competitive binding protein technique (CBPA) when a bacterial dihydrofolate reductase is used as the binding protein. No interference occurs if methotrexate is measured by a radioimmunoassay (RIA). The presence of trimethoprim and sulfamethoxazole may also interfere with the Jaffe alkaline picrate reaction assay for creatinine, resulting in overestimations of about 10% in the range of normal values.

Carcinogenesis, Mutagenesis, Impairment of Fertility: *Carcinogenesis:* Long-term studies in animals to evaluate carcinogenic potential not conducted with Bactrim. *Mutagenesis:* Bacterial mutagenic studies not performed with sulfamethoxazole and trimethoprim in combination. Trimethoprim demonstrated to be nonmutagenic in the Ames assay. No chromosomal damage observed in human leukocytes *in vitro* with sulfamethoxazole and trimethoprim alone or in combination; concentrations used exceeded blood levels of these compounds following therapy with Bactrim. Observations of leukocytes obtained from patients treated with Bactrim revealed no chromosomal abnormalities. *Impairment of Fertility:* No adverse effects on fertility or general reproductive performance observed in rats given oral dosages as high as 70 mg/kg/day trimethoprim plus 350 mg/kg/day sulfamethoxazole.

Pregnancy: Teratogenic Effects: Pregnancy Category C. Trimethoprim and sulfamethoxazole may interfere with folate acid metabolism; use during pregnancy only if potential benefit justifies potential risk to fetus. Nonteratogenic Effects: See CONTRAINDICATIONS section.

Nursing Mothers: See CONTRAINDICATIONS section.

Pediatric Use: Not recommended for infants under two months (see INDICATIONS AND CONTRAINDICATIONS sections).

ADVERSE REACTIONS: Most common are gastrointestinal disturbances (nausea, vomiting, anorexia) and allergic skin reactions (such as rash and urticaria). **FATALITIES ASSOCIATED WITH THE ADMINISTRATION OF SULFONAMIDES, ALTHOUGH RARE, HAVE OCCURRED DUE TO SEVERE REACTIONS, INCLUDING STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, FULMINANT HEPATIC NECROSIS, AGRANULOCYTOSIS, APLASTIC ANEMIA AND OTHER BLOOD DYSCRASIAS (SEE WARNINGS SECTION).** *Hematologic:* Anemia, leukopenia, thrombocytopenia, leukopenia, neutropenia, hemolytic anemia, megaloblastic anemia, hypoprothrombemia, methemoglobinemia, eosinophilia. *Allergic Reactions:* Stevens-Johnson syndrome, toxic epidermal necrolysis, anaphylaxis, allergic myocarditis, erythema multiforme, exfoliative dermatitis, angioedema, drug fever, chills, Henoch-Schoenlein purpura, serum sickness-like syndrome, generalized allergic reactions, generalized skin eruptions, photosensitivity, conjunctival and scleral injection, pruritus, urticaria and rash. *Periarteritis nodosa* and systemic lupus erythematosus have been reported. *Gastrointestinal:* Hepatitis (including cholestatic jaundice and hepatic necrosis), elevation of serum transaminase and bilirubin, pseudomembranous enterocolitis, pancreatitis, stomatitis, glossitis, nausea, abdominal pain, diarrhea, anorexia. *Genitourinary:* Renal failure, interstitial nephritis, BUN and serum creatinine elevation, toxic nephrosis with oliguria and anuria, crystalluria. *Neurologic:* Aseptic meningitis, convulsions, peripheral neuritis, ataxia, vertigo, tinnitus, headache. *Psychiatric:* Hallucinations, depression, apathy, nervousness. *Endocrine:* Sulfonamides bear certain chemical similarities to some goitrogens, diuretics (acetazolamide and the thiazides) and oral hypoglycemic agents; cross-sensitivity may exist. Diuresis and hypoglycemia have occurred rarely in patients receiving sulfonamides. *Respiratory:* Pulmonary infiltrates. *Musculoskeletal:* Arthralgia, myalgia. *Miscellaneous:* Weakness, fatigue, insomnia.

DOSAGE AND ADMINISTRATION: Not recommended for use in infants less than two months of age. **URINARY TRACT INFECTIONS AND SHIGELLOSIS IN ADULTS AND CHILDREN, AND ACUTE OTITIS MEDIA IN CHILDREN:** *Usual adult dosage* for urinary tract infections is one DS tablet, two tablets or four teaspoonsful (20 ml) b.i.d. for 10 to 14 days. Use identical daily dosage for 5 days for shigellosis. *Recommended dosage for children* with urinary tract infections or acute otitis media is 8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses every 12 hours for 10 days. Use identical daily dosage for 5 days for shigellosis. *Renal Impaired:* Creatinine clearance above 30 ml/min, give usual dosage; 15-30 ml/min, give one-half the usual regimen; below 15 ml/min, use not recommended.

ACUTE EXACERBATIONS OF CHRONIC BRONCHITIS IN ADULTS: Usual adult dosage is one DS tablet, two tablets or four teasp.

PNEUMOCYSTIS CARINII PNEUMONIA: Recommended dosage is 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

HOW SUPPLIED: DS (double strength) tablets (160 mg trimethoprim and 800 mg sulfamethoxazole)—bottles of 100, 250 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 20, 40, 60, 80, 100, 120, 140, 160, 180, 200, 220, 240, 260, 280, 300, 320, 340, 360, 380, 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40. *Pediatric Suspension* (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 100 ml and 16 oz (1 pint). *Suspension* (40 mg trimethoprim and 200 mg sulfamethoxazole per teasp.)—bottles of 16 oz (1 pint).

STORE TABLETS AT 15°-30°C (59°-86°F) IN A DRY PLACE PROTECTED FROM LIGHT. STORE SUSPENSIONS AT 15°-30°C (59°-86°F) PROTECTED FROM LIGHT.

You've probably heard that partnerships don't make sense anymore without the tax benefits. We suggest that if you participate in our unique situations, the tax benefits will not seem important . . . considering the profit potential!

We are working with substantial New Jersey Real Estate developers who use private investor capital as a component of their project financing. Our goal is to make you money and keep some of it reinvested with us. In an effort to reduce your out-of-pocket cash, we have financing available for those who wish to leverage the commitment.

If short-term, non-syndicated no-load private situations interest you, your inquiry is welcome. Seasoned investors only.

CAPITAL PLACEMENTS 201/736-6924

MEDICAL DIRECTOR

Pennsylvania Blue Shield, the newly designated Medicare Part B carrier for the State of New Jersey, will be opening an office in the Trenton area and is seeking a full-time Medical Director. Requirements for this position include Board Certification and five years of clinical experience.

As a member of our Executive Staff, your responsibilities will include:

- Participation in the development and implementation of medical policy
- Interaction with health care providers and provider organizations
- Development of a state-wide professional consultant network
- Liaison with providers, regulators and customers

If you can demonstrate achievements in a business-oriented environment, we will provide a career challenge with a lucrative total compensation package. Send your curriculum vitae, including salary expectations to: Thomas C. Sommers, Vice President, Human Resources Administration, Pennsylvania Blue Shield, 1800 Center Street, Camp Hill, PA 17011. THE MEDICAL SOCIETY OF NEW JERSEY

Volume 58

PROPOSED MALPRACTICE SURCHARGE

The Medical Society of New Jersey has called on Governor Thomas H. Kean to intervene to halt an effort by the State Department of Insurance to impose more than \$60 million in the liabilities of a defunct, cut-rate medical malpractice insurance company on thousands of practicing physicians who had no involvement in the losses.

In a letter to the governor, Dr. Palma E. Formica, MSNJ president, announced the Society's availability "to meet with you and to help forge a responsible and meaningful solution" to the problem created by the deficit of the New Jersey Medical Malpractice Re-insurance Association (MMRA) which the State Insurance Department formed in 1976 and closed down in 1982. Dr. Formica wrote in response to an announcement by Insurance Commissioner Kenneth D. Merin that he was proposing a regulation that for seven years would impose a 5 percent annual surcharge on the malpractice premiums of 13,400 New Jersey physicians and podiatrists in order to eliminate the MMRA shortfall.

Dr. Formica wrote: "This Society repeatedly has advised Mr. Merin that he was not pursuing a legally acceptable, professionally competent, equitable, or feasible course for funding that deficit."

She noted that the Insurance Department permitted MMRA to write coverage at rates substantially below those of the Medical Inter-Insurance Exchange of New

Jersey (MIENJ), a pre-existing doctor-owned company with which it was competing. Physicians who joined MIENJ not only were required to pay rates higher than the state-sponsored carrier, but also contributed to the initial capital of MIENJ. Nevertheless, the majority of New Jersey's physicians joined the privately operated company which, through the payment of adequate premiums by its members, has continued to grow and provide coverage to most of the state's practicing physicians.

Under Commissioner Merin's proposal, physicians who are insured by MIENJ and other carriers and who, as a result, paid higher premiums, would pay the same surcharge as those doctors who took advantage of the state-sponsored "bargain." Those of MMRA's 3,300 insureds who are no longer practicing in New Jersey would pay no surcharge at all, even though they may have been responsible for losses.

Furthermore, the Medical Society objects to the fact that younger physicians who were not in practice at the time, or doctors who have moved to the state since 1982 also will be forced to subsidize the losses of those who benefited from the six years of "cut-rate" state coverage.

Another inequity in Commissioner Merin's proposal is the fact that the surcharge would not be applied to physicians who are employed by the University of Medicine and Dentistry of New Jersey or in other areas of government or to their employing agencies.

Society Boosts Medical Waste Law

Just last month, Governors Kean and Cuomo announced their states' adoption of emergency regulations requiring special handling for medical waste. Initially, physicians will be required to submit a one-time summary of the medical waste they generate from November 15 through December 15. The report will be due in mid-January. By then, the new law should be in effect.

Responding to the deteriorating situation, the Society's Council on Legislation voted to support the inclusion of physicians and other practitioners in the medical waste disposal system which will be created by S-2343/A-2853. Having endorsed the bill, the Society also gained some important amendments along the way.

The legislation began last spring with identical measures introduced in each house. It applied to private practitioners as well as facilities such as hospitals and laboratories, requiring them to separately package and identify their waste as either "general" or "special." The Assembly bill moved first, but was amended to exempt practitioners and to not apply to "general" waste such as for rubber gloves, tongue depressors, bandages, and other benign items.

A-2853 passed the Assembly, but practitioners were brought back into the measure by a Senate committee amendment. The rewritten bill then was merged with its Senate companion.

The current measure deals strictly with "special" waste: microbiological culture media; needles, syringes, and sharps; pathology specimens; blood products and body fluids of at least 20 cc in volume; and any disposable substance which has been exposed thereto, as determined by Health Department regulation.

Under the bill, practitioners and facilities will register with the Department of Environmental Protection, separately package "special" waste, and assure that it is handled by approved haulers.

The Society successfully urged adoption of three amendments beneficial to physicians:

- S-2343/A-2853 will set a uniform statewide procedure for disposing special medical waste. The law will supersede the current hodgepodge of local and county ordinances in effect throughout New Jersey, and will establish a reference list of state-approved haulers. No such document exists today.
- The annual registration fee charged by the DEP will reflect the volume of special waste produced by the generator. Thus, physicians will pay less than the maximum \$100 for a hospital.

- The "strict liability" section of the bill, which originally could have required an innocent practitioner or facility to pay for the cleanup of illegal discharges, has been modified. The bill now requires the DEP to attempt to determine whether the illegal discharge was committed by the generator, hauler, or disposer, and attempt to recover costs from the party at fault before assessing other parties.

With the Society's amendments, the bill will help the physician come to grips with a vexing problem—and it will help boost public confidence in medicine's commitment to a clean environment.

Aided by the Society's endorsement, a medical waste disposal bill has won unanimous approval in the Senate and is ready for final action in the Assembly.

The bill, S-2343/A-2853, was inspired by tremendous public concern about beach pollution. This summer, like last, was marred by reports of syringes and blood vials washing up on the New Jersey shore. Concern became panic when the Health Department found that the washed-up blood samples tested positive for AIDS and hepatitis.

Making the situation worse were media reports of medical waste found on the streets and in trash cans outside of laboratories and physicians' offices. A lab in Perth Amboy was charged by the Attorney General with dumping infectious waste and had its license suspended. A group of urologists, also in Perth Amboy, was issued a summons for allegedly disposing of syringes and blood vials in the ordinary trash. A Union County pathologist found that his hauler refused to pick up ordinary trash at his office.

Court Decisions

Doctors Sued by Patients Tested for HIV Without Permission; Prisoner with AIDS Convicted of Assault with Dangerous Weapon; Quirks in Law so Lawyer and Hospital Net Full Award; Liability from Expanding Home Care Programs Poses New Worries; Hospital Liable for Staff Physician's Off-Premise Conduct; Data on Physician-Owned Companies Reveals Tremendous Growth

DOCTORS SUED BY PATIENTS TESTED FOR HIV WITHOUT PERMISSION

Three men who charged that physicians tested their blood for HIV antibodies without their permission are suing the physicians for negligence, invasion of privacy, and emotional distress in three separate Pennsylvania lawsuits.

"A very high percentage of people are being tested without the patients' knowledge and the results frequently are not given to the patients," said the Philadelphia attorney. The men, who had consulted the physicians for other reasons, were informed they had tested positive but given no counseling, he added. One plaintiff has tested negative for HIV infection in two subsequent tests, while the other two have declined to be tested again.

Two of the three "John Doe" suits filed in Philadelphia Court of Common Pleas on March 30, seek damages of \$100,000 each. The third complaint, filed March 31, in Harrisburg, seeks damages in excess of \$10,000.

One plaintiff, who also is charging breach of confidentiality, alleged that he had been hounded out of a small Pennsylvania community after rumors spread that he was dying of AIDS. The Philadelphia attorney said it was not known who might have leaked the results of the test to outsiders but speculated it may have been a technician in a laboratory where the plaintiff had been sent for a blood test. (*AIDS Policy and Law*, April 20, 1988)

PRISONER WITH AIDS CONVICTED OF ASSAULT WITH DANGEROUS WEAPON

Evidence supported the conviction of a prisoner with AIDS of assault with a dangerous weapon after he bit two correction officers, a federal trial court in Minneapolis ruled.

The prisoner bit one officer on the leg twice, leaving a four-inch saliva stain. He bit a second officer on the leg, breaking the skin and leaving a mark that was visible five months later. He stated that he intended to kill the officers.

A jury convicted the prisoner on two counts of assault with a deadly or dangerous weapon. The prisoner moved for judgment of acquittal or a new trial. He contended that the evidence was insufficient to sustain the conviction. He argued that for his mouth and teeth to be a deadly and dangerous weapon there must be sufficient evidence to show that the AIDS virus can be transmitted by a human bite.

The court said that the evidence showed that AIDS could be transmitted through bodily fluids such as blood and semen. The prisoner had been informed that he had both the AIDS virus and hepatitis antibody.

A physician testified at trial that any human bite could cause a serious infection because of the variety of infectious micro-organisms present in the mouth. He said that blood is sometimes present in the mouth, particularly if a person has ill-fitting teeth or gum problems. He stated that the prisoner had some false teeth or a bridge.

The prisoner contended that the court erred in allowing testimony as to the precautions that the officers were instructed to take to avoid infecting their families. The court said that this testimony did not require a new trial. Rather, the court said that it was probative of the dangerousness of the bites inflicted and that its probative value outweighed any prejudicial effect. QUIRKS IN LAW SO LAWYER AND HOSPITAL NET FULL \$3.5 MILLION AWARD

Because Florida does not recognize common-law marriage, a \$3.5 million malpractice award to a brain-damaged Fort Lauderdale woman is leaving her unemployed immigrant mate and their six children virtually penniless and in limbo.

Their attorney received 45 percent of the amount. The rest is held in trust to care for the comatose plaintiff in the North Miami Medical Center at the rate of \$1,000 a day. "The culprit here is the law," stated the plaintiff's attorney. "We are sympathetic. The judges were sympathetic. But everyone was locked in a set of legal handcuffs."

Another Florida statute prevents the children, aged 3 to 19, from access to the trust fund as long as their mother is alive, although a court agreed to disburse \$2,500 monthly on behalf of the five minor children.

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department, and Director of Special Projects, respectively.

A circuit judge tried to give the family \$104,000. But, citing state law, a probate judge forced the father, an illiterate Jamaican, to pay it back.

The malpractice suit was against the Broward Medical Center where in 1985, the plaintiff's heart stopped during a caesarean section. Her baby was not damaged. The award came after 30 months of litigation. (*Medical Liability Monitor*, April 15, 1988, Volume 13, Number 4)

LIABILITY FROM EXPANDING HOME CARE PROGRAMS POSES NEW WORRIES

Home care programs are likely candidates for malpractice suits in the 1990s, the American Hospital Association has suggested.

The greatest liability risk stems from the unsupervised care provided in the increasingly popular programs. At home, there is no one to ensure the patient follows the treatment plan consistently. Without monitoring, patients may use equipment improperly, miss medications, or unplug respirators. Medical complications, such as infections, can take longer to identify.

Hospitals, which operate nearly one out of every four Medicare-certified home care programs, can be liable for such problems under theories of negligence—too early discharges, deterioration of condition—and product liability—selling defective home care products, the American Hospital Association said.

Gerald Phillips, vice-president of Alexander & Alexander, Nashville, recommends that hospital-sponsored home care programs carry their own professional liability coverage. When hospitals contract with other agencies to provide home care services, they should negotiate "hold harmless" clauses, exempting the hospital, said James Orlikoff, director of the American Hospital Association's Institute on Quality of Care and Patterns of Practice, which termed home care a future liability area. (*Medical Liability Monitor*, April 18, 1988, Volume 13, Number 4)

HOSPITAL LIABLE FOR STAFF PHYSICIAN'S OFF-PREMISES CONDUCT

Given the litigious nature of our society and soaring insurance costs, any decision that extends the scope of hospital liability deserves comment. The Massachusetts Supreme Judicial Court (SJC) has held that a hospital may be liable for a staff physician's improper conduct even though it took place outside the hospital in a patient's apartment.

The plaintiff, a former patient of a neurosurgeon who was on the visiting staff of a hospital, sued for injuries suffered when the neurosurgeon drugged and raped her. At the time of the incident, she was an employee of the same hospital.

At trial, the hospital moved for summary judgment. For purposes of the motion, the trial judge assumed that the hospital had been negligent. But, in granting the hospital's motion, the judge in effect ruled as a matter of law that its negligence had not been the proximate cause of the plaintiff's injuries.

On appeal, the SJC recast the issue as one of foreseeability. Noting that the hospital was aware of at least two prior instances in which patients of the physician had lodged formal complaints of sexual molestation,

the high court essentially decided that it was foreseeable that another instance of abuse might occur.

The general rule is that an intervening criminal act by a third party breaks the chain of proximate cause if the original wrongdoer reasonably could not have foreseen the act. Thus, the real question before the SJC was the legal limits of foreseeability. The SJC held that the judge's ruling was erroneous—the withdrawal of the physician's staff privileges (the ultimate response of which the hospital was capable) would not have prevented the rape. It accepted the plaintiff's argument that she relied on the physician's reputation and that if she had heard that his staff privileges were revoked, she would have chosen another physician.

The SJC opinion elicited two sharp dissents. Both judges argued that as a matter of law, no hospital should owe a duty of care to persons who are visited by staff physicians in their homes. In their view, if a hospital owed a duty to protect patients from physicians, it ended at the hospital door.

This decision is most disturbing. It can only serve notice on hospital administrators that in addressing allegations of physician misconduct, they should act promptly and in the direction of disciplining physicians. This may create situations in which physicians lose staff privileges before a full investigation occurs. (Philip Reilly, J.D., M.D., *Medical Liability Monitor*, June 17, 1988, Vol. 13, Number 6)

DATA ON PHYSICIAN-OWNED COMPANIES REVEALS TREMENDOUS GROWTH

In the 1970s, they were known as the "bedpan mutuals." Today, the nation's physician-owned medical malpractice insurance companies operate in at least 40 states and the District of Columbia, insure 172,000 physicians, and write \$1,941,000,000 in annual premiums.

Data provided by 41 companies listed in the 1988 directory of the Physician Insurers Association of America (PIAA) released at the association's annual meeting in San Diego also provided insights into premium ranges around the country. The national average premium for \$1 million coverage is \$11,200. The average premium by region ranges from a low of \$10,300 in the west to \$10,400 in the central region, \$11,500 in the south, and \$13,600 in the east.

Rates for high-risk surgeons, however, can be described accurately as astronomical, particularly in Florida, New York, and Michigan. The Florida Physicians Insurance Company charges a high of \$185,000 in the Miami area and the annual premium for similar specialists in certain sections of New York state is \$115,000.

In refreshing contrast, Oklahoma's premiums are far and away the lowest in the nation. The state's occurrence rate for top-risk surgeons is \$11,900, just \$700 more than the national average for all physician classifications.

At the close of 1987, the 41 PIAA companies had an aggregate surplus of \$900 million or an amount equal to about \$5,100 per policyholder. Here again, the west leads the way with \$7,300 in surplus per policyholder compared with \$4,300 in the central region, \$3,600 in the south, and \$4,600 in the east. (*Medical Liability Monitor*, June 17, 1988, Vol. 13, Number 6)

PromptCare

"We care . . . about your health"

Attention Hospital Executives and Physicians:

ARE YOU READY TO JOINT VENTURE WITH YOUR MEDICAL STAFF?
ARE YOU READY TO ASSUME ECONOMIC CONTROL OVER YOUR MEDICAL PRACTICE?

ARE YOU READY TO ASSUME CLINICAL LEADERSHIP FOR YOUR PATIENTS DISCHARGED "QUICKER & SICKER" WHO REQUIRE AIDS THERAPY, OXYGEN OR DME?

ARE YOU READY TO JOIN 2,000 NEW JERSEY PHYSICIANS IN GROUP PURCHASING OF MEDICAL AND OFFICE SUPPLIES? DO YOU NEED HELP WITH OFFICE MEDICAL WASTE DISPOSAL?

PromptCare has helped eleven groups of physicians and nineteen hospitals establish their own Home Health Care Equipment and Medical Office Supply companies. No more just signing forms for outsiders without input. No more profits to outsiders for necessary office expenses. No more national firms coming into New Jersey.

If you and your peers are interested, please contact Mr. Michael Garippa, President, at 355-0200 or 1-800-451-0038. As few as 15 physicians can create a new group.

The PromptCare Companies—The largest collective physician effort in NJ business: Summit, Rahway, Elizabeth, Corvas, Plainfield, Ocean, Atlantic, Hudson County, Raritan, Cathedral and Passaic.

LEVOXINE®

(LEVOTHYROXINE SODIUM TABLETS, USP)

FOR ORAL ADMINISTRATION

DESCRIPTION:

Each LEVOXINE (Levothyroxine Sodium, USP) tablet contains synthetic crystalline levothyroxine sodium (L-thyroxine). L-thyroxine is the principal hormone secreted by the normal thyroid gland. Chemically, L-thyroxine is designated as L-tyrosine, O-(4-hydroxy-3, 5-diiodophenyl) - 3,5-diiodo-, monosodium salt, hydrate. The molecular formula is $C_{15}H_{10}I_2NNaO_4$ and the structural formula is:

CLINICAL PHARMACOLOGY:

The principal effect of thyroid hormones is to increase the metabolic rate of body tissues.

The thyroid hormones are also concerned with growth and development of tissues in the young.

The major thyroid hormones are L-thyroxine (T_4) and L-triiodothyronine (T_3). The amounts of T_4 and T_3 released from the normally functioning thyroid gland are regulated by the amount of thyrotropin (TSH) secreted from the anterior pituitary gland. T_4 is the major component of normal thyroid gland excretions and is therefore the primary determinant of normal thyroid functions. T_4 acts as a substrate for physiologic deiodination to T_3 in the peripheral tissues. The physiologic effects of thyroid hormones are mediated at the cellular level primarily by T_3 .

LEVOXINE (L-thyroxine) tablets taken orally provide T_4 which upon absorption can not be distinguished from T_4 that is secreted endogenously.

INDICATIONS AND USAGE:

LEVOXINE (L-thyroxine) tablets are indicated as replacement or supplemental therapy for diminished or absent thyroid function (e.g., cretinism, myxedema, nontoxic goiter or hypothyroidism generally, including the hypothyroid state in children, in pregnancy and in the elderly) resulting from functional deficiency, primary atrophy, from partial or complete absence of the gland or from the effects of surgery, radiation or antithyroid agents. Therapy must be maintained continuously to control the symptoms of hypothyroidism.

CONTRAINDICATIONS:

L-thyroxine therapy is contraindicated in thyrotoxicosis, acute myocardial infarction and uncorrected adrenal insufficiency.

WARNINGS:

Drugs with thyroid hormone activity, alone or together with other therapeutic agents, have been used for the treatment of obesity. In euthyroid patients, doses within the range of daily hormonal requirements are ineffective for weight reduction. Larger doses may produce serious or even life-threatening manifestations of toxicity, particularly when given in association with sympathomimetic amines such as those used for their anorectic effects.

PRECAUTIONS:

General — Caution must be exercised in the administration of this drug to patients with cardiovascular disease. Development of chest pains or other aggravation of the cardiovascular disease requires a reduction of dosage.

LEVOXINE (L-thyroxine) 100 mcg (0.1 mg), 200 mcg (0.2 mg) and 300 mcg (0.3 mg) tablets contain FD & C Yellow No. 5 (tartrazine) which may cause allergic-type reactions (including bronchial asthma) in certain susceptible individuals. Although the overall incidence of FD & C Yellow No. 5 (tartrazine) sensitivity in the general population is low, it is frequently seen in patients who also have aspirin hypersensitivity.

Information For The Patient — Patients on thyroid preparations and parents of children on thyroid therapy should be informed that:

1. Replacement therapy is to be taken essentially for life, with the exception of cases of transient hypothyroidism, usually associated with thyroiditis, and in those patients receiving a therapeutic trial of the drug.
2. They should immediately report during the course of therapy any signs or symptoms of thyroid hormone toxicity, e.g., chest pain, increased pulse rate, palpitations, excessive sweating, heat intolerance, nervousness, or any other unusual event.
3. In case of concomitant diabetes mellitus, the daily dosage of antidiabetic medication may need readjustment as thyroid hormone replacement is achieved. If thyroid medication is stopped, a downward readjustment of the dosage of insulin or oral hypoglycemic agent may be necessary to avoid hypoglycemia. At all times, close monitoring of urinary glucose levels is mandatory in such patients.

4. In case of concomitant oral anticoagulant therapy, the prothrombin time should be measured frequently to determine if the dosage of oral anticoagulants is to be readjusted.

5. Partial loss of hair may be experienced by children in the first few months of thyroid therapy, but this is usually a transient phenomenon and later recovery is usually the rule.

Laboratory Tests — The patient's response to thyroid replacement may be followed by laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels.

Drug Interactions — In patients with diabetes mellitus, addition of thyroid hormone therapy may cause an increase in the required dosage of insulin or oral hypoglycemic agents. Therefore, patients with diabetes mellitus should be observed closely for possible changes in antidiabetic drug dosage requirements.

Patients stabilized on oral anticoagulants who are found to require thyroid replacement therapy should be watched very closely when therapy is started. If a patient is truly hypothyroid, it is likely that a reduction in anticoagulant dosage will be required. No special precautions appear to be necessary when oral anticoagulant therapy is begun in a patient already stabilized on maintenance thyroid replacement therapy.

Cholestyramine binds both T_4 and T_3 in the intestine, thus impairing absorption of these thyroid hormones. In vitro studies indicate that the binding is not easily removed. Therefore, four to five hours should elapse between administration of cholestyramine and thyroid hormones.

Estrogens tend to increase serum thyroxine-binding globulin (TBG). In a patient with a non-functioning thyroid gland who is receiving thyroid replacement therapy, free thyroxine may be decreased when estrogens are started thus increasing thyroid requirements. However, if the patient's thyroid gland has sufficient function the decreased free thyroxine will result in a compensatory increase in thyroxine output by the thyroid. Therefore, patients without a functioning thyroid gland who are on thyroid replacement therapy may need to increase their thyroid dose if estrogens or estrogen containing oral contraceptives are given.

Drug/Laboratory Test Interactions — The following drugs or moieties are known to interfere with laboratory tests performed on patients taking thyroid hormone: androgens, corticosteroids, estrogens, oral contraceptives containing estrogens, iodine-containing preparations, and the numerous preparations containing salicylates.

1. Changes in TBG concentration should be taken into consideration in the interpretation of T_4 and T_3 values. In such cases, the unbound (free) hormone should be measured. Pregnancy, estrogens, and estrogen-containing oral contraceptives increase TBG concentrations. TBG may also be increased during infectious hepatitis. Decreases in TBG concentrations are observed in nephrosis, acromegaly, and after androgen or corticosteroid therapy. Familial hyper- or hypo-thyroxine-binding-globulinemias have been described. The incidence of TBG deficiency approximates 1 in 9000. The binding of thyroxine by thyroid-binding prealbumin (TBPA) is inhibited by salicylates.

2. Medical or dietary iodine interferences with all in vivo tests of radio-iodine uptake, producing low uptakes which may not be reflective of a true decrease in hormone synthesis.

3. The persistence of clinical and laboratory evidence of hypothyroidism in spite of adequate dosage replacement indicates either poor patient compliance, poor absorption, excessive fecal loss, or inactivity of the preparation. Intracellular resistance to thyroid hormone is quite rare.

Carcinogenesis, Mutagenesis, And Impairment Of Fertility

— A reportedly apparent association between prolonged thyroid therapy and breast cancer has not been confirmed and patients on thyroid for established indications should not discontinue therapy. No confirmatory long-term studies in animals have been performed to evaluate carcinogenic potential, mutagenicity, or impairment of fertility in either males or females.

Pregnancy — Category A — Thyroid hormones do not readily cross the placental barrier. The clinical experience to date does not indicate any adverse effect on fetuses when thyroid hormones are administered to pregnant women. On the basis of current knowledge, thyroid replacement therapy to hypothyroid women should not be discontinued during pregnancy.

Nursing Mothers — Minimal amounts of thyroid hormones are excreted in human milk. Thyroid is not associated with serious adverse reactions and does not have a known tumorigenic potential. However, caution should be exercised when thyroid is administered to a nursing woman.

Pediatric Use — Pregnant mothers provide little or no thyroid hormone to the fetus. The incidence of congenital hypothyroidism is relatively high (1:4,000) and the hypothyroid fetus would not derive any benefit from the small amounts of hormone crossing the placental barrier. Routine determinations of serum (T_4) and/or TSH is strongly advised in neonates in view of the deleterious effects of thyroid deficiency on growth and development.

Treatment should be initiated immediately upon diagnosis, and maintained for life, unless transient hypothyroidism is suspected; in which case, therapy may be interrupted for 2 to 8 weeks after the age of 3 years to reassess the condition. Cessation of therapy is justified in patients who have maintained a normal TSH during those 2 to 8 weeks.

ADVERSE REACTIONS:

Adverse reactions are due to overdosage and are those of induced hyperthyroidism.

OVERDOSAGE — Excessive dosage of thyroid medication may result in symptoms of hyperthyroidism. Since, however, the effects do not appear at once, the symptoms may not appear for one to three weeks after the dosage regimen is begun. The most common signs and symptoms of overdosage are weight loss, palpitation, nervousness, diarrhea or abdominal cramps, sweating, tachycardia, cardiac arrhythmias, angina pectoris, tremors, headache, insomnia, intolerance to heat and fever. If symptoms of overdosage appear, discontinue medication for several days and reinstitute treatment at a lower dosage level.

Laboratory tests such as serum T_4 , serum T_3 and the free thyroxine index will be elevated during the period of overdosage.

Complications as a result of the induced hypermetabolic state may include cardiac failure and death due to arrhythmia or failure.

TREATMENT OF OVERDOSAGE — Dosage should be reduced or therapy temporarily discontinued if signs and symptoms of overdosage appear. Treatment may be reinstituted at a lower dosage. In normal individuals, normal hypothalamic-pituitary-thyroid axis function is restored in 6 to 8 weeks after thyroid suppression.

Treatment of acute massive thyroid hormone overdosage is aimed at reducing gastrointestinal absorption of the drugs and counteracting central and peripheral effects, mainly those of increased sympathetic activity. Vomiting may be induced initially; if further gastrointestinal absorption can reasonably be prevented, and barring contraindications such as coma, convulsions, or loss of the gagging reflex. Treatment is symptomatic and supportive. Oxygen may be administered and ventilation maintained. Cardiac glycosides may be indicated if congestive heart failure develops. Measures to control fever, hypoglycemia, or fluid loss should be instituted if needed. Antiadrenergic agents, particularly propranolol, have been used advantageously in the treatment of increased sympathetic activity. Propranolol may be administered intravenously at a dosage of 1 to 3 mg over a 10 minute period orally, 80 to 160 mg/day, especially when no contraindications exist for its use.

DOSAGE AND ADMINISTRATION:

The goal of therapy should be the restoration of euthyroidism as judged by clinical response and confirmed by appropriate laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels. The age and general condition of the patient and the severity and duration of hypothyroid symptoms determine the starting dosage and the rate of incremental dosage increase leading to a final maintenance dosage.

In otherwise healthy adults, the recommended initial dose is 25 to 100 mcg (0.025 to 0.1 mg) daily, while the predicted full maintenance dose of 100 to 200 mcg (0.1 to 0.2 mg) daily may be achieved in two to three weeks.

In the elderly patient with long standing disease, evidence of myxedema, or evidence of cardiovascular dysfunction, the initial dose may be as little as 12½ mcg (0.0125 mg) per day. Incremental increases of 25 mcg (0.025 mg) per day at 3 to 4 week intervals may be instituted depending on patient response. It is the physician's judgement of the severity of the disease and close observation of patient response which determine the rate and extent of dosage increase.

In infants and children there is a great urgency to achieve thyroid replacement because of the critical importance of thyroid hormone in sustaining growth and maturation. Despite the smaller body size, the dosage needed to sustain a full rate of growth, development and general thriving is higher in the child than in the adult. The recommended daily replacement dosage: L-thyroxine in childhood is: 0-1 years: 9 mcg/kg; 1-5 years: 6 mcg/kg; 6-10 years: 4 mcg/kg; 11-20 years: 3 mcg/kg daily.

DOSAGE FORMS AVAILABLE:

LEVOXINE (L-thyroxine) tablets are supplied as oval, color coded, potency marked tablets in 10 strengths, 12½ mcg (0.0125 mg) — maroon, 25 mcg (0.025 mg) — orange, 50 mcg (0.05 mg) — white, 75 mcg (0.075 mg) — purple, 100 mcg (0.1 mg) — yellow, 125 mcg (0.125 mg) — brown, 150 mcg (0.15 mg) — blue, 175 mcg (0.175 mg) — turquoise, 200 mcg (0.2 mg) — pink and 300 mcg (0.3 mg) — green in bottles of 100 and 1000, and unit dose in cartons of 10 (10 strips of 10 tablets).

Levoxine[®]

(Levothyroxine Sodium Tablets, USP)

NOW FOR MORE PRECISE DOSING

NEW 12 1/2 mcg

**Finally, a bioequivalent replacement
for Synthroid[®]
that's reasonably priced.**

Introducing Levoxine from Daniels Pharmaceuticals — a breakthrough quality manufactured Levothyroxine Sodium Tablets, USP. Levoxine is now available in a 12 1/2 mcg tablet for more precise dosing.

Randomized crossover studies comparing the bioequivalency of Levoxine tablets to Synthroid tablets showed no significant difference in thyroxine (T₄), triiodothyronine (T₃) or free thyroxine index (T₇).

Levoxine is available in ten color-coded strengths to assure prescriptive compliance and patient acceptance. Each strength is put through extensive quality control measures to ensure the highest quality. Prescribe Levoxine and give your patients exactly what they need at a price that's more affordable.

Your medical practice is a business, and if that business does not run efficiently, it will affect your patient and public relations.

MARY ANN HAMBURGER ASSOCIATES

would evaluate each element of your office operations and work with you...confidentially... on an individual basis, to help you achieve your aims as a businessperson and as a practicing physician.

Mary Ann can help by evaluating your:

- APPOINTMENT and/or SURGERY SCHEDULING • BILLING
- BOOKKEEPING • COLLECTIONS • CPT CODES and MACC
- PROFILES— ICD CODES • EQUIPMENT and SUPPLIES • FEE SCHEDULES • FILING SYSTEM • HIRING and TRAINING of NEW and PRESENT PERSONNEL • INSURANCE (THIRD PARTY BILLING) • OFFICE LAYOUT and LOCATION • PATIENT FLOW
- RECALL SYSTEM • RECRUITMENT FOR HOSPITALS
- PURCHASING and SELLING of MEDICAL PRACTICES
- TELEPHONE MANAGEMENT

Mary Ann can recommend specialists for your business practice in these vital areas:

- ACCOUNTING • FINANCE • INSURANCE • LAW

Mary Ann Hamburger offers you many services ranging from a one-time survey to a continuing service in which she will make regular visits to your office to help with any pending problems.

Senior Citizens Courtesy Program

PALMA E. FORMICA, M.D.

Questions and answers about the Senior Citizens Courtesy Program.

Shortly after taking office, I wrote to each of you urging your participation in the Senior Citizens

Courtesy Program. I am pleased with the response and thank those of you for support and participation. Yet, there still appears to be some questions.

Q: What is the Seniors Courtesy Program?

A: In September 1986, the Union County Medical Society started a Senior Citizens Courtesy Program as an alternative to the Medicare participating physicians program. Working with the Senior Citizens Council of Union County, the Medical Society established a program whereby physicians voluntarily agree to accept assignment for those individuals who had a financial need. The group screens applicants and issues special "courtesy" cards. The financial eligibility is the same as for the Pharmaceutical Assistance to the Aged and Disabled Program sponsored by the state of New Jersey. Physicians volunteer to accept assignment. The MSNJ office staff serves as a referral source for those who need a physician.

The House of Delegates and the Board of Trustees of MSNJ encouraged similar programs in each of the component medical societies. To date, every county has such a program. Some work closely with senior groups or the offices on aging, others have less formal structures. Basically, the criteria for a patient to be eligible for the program is to be a PAAD cardholder, or to be within the financial limits of the PAAD program: \$13,250 annual income for a single person; or \$16,250 for a couple. (Bergen County Medical Society has established higher limits.) Physicians who voluntarily participate are asked to list their names with their local county medical society offices.

When a physician agrees to be a part of this volun-

tary program, he agrees to accept assignment for services to patients who meet the criteria or who are PAAD cardholders. By law, the physician must make an attempt to collect the \$75 deductible and the 20 percent copayment. Ironically, when a physician "wrote off" the deductible and/or the copayment routinely on all, or almost all cases, the government's fiscal intermediary (the insurance carrier) reduced that physician's profile of charges by the amount written off. The physician can determine for himself whether or not he will accept new patients.

Q: Who should participate?

A: Any physician who is not enrolled in the Medicare participating physicians program is encouraged to join. In New Jersey, 22.7 percent of physicians were enrolled in the government program in 1987. These individuals have agreed to accept assignment on all services rendered to every Medicare recipient. The Physicians Payment Review Commission has acknowledged that noneconomic and philosophical concerns affect the refusal to join the federal program. Many are reluctant to yield the freedom of decision making on billing to the government.

It is evident that most physicians have been accepting assignment on a case by case basis. In 1987, 63 percent of all claims were assigned. Since physicians always have been sensitive to the needs of their patients, this voluntary program simplifies the determination of need and eliminates the necessity of the patient having to ask for the service.

Q: Won't this voluntary program lead to mandatory assignment?

A: During the hearings on the mandatory assignment bills in the last session of the legislature, the lawmakers were impressed by the voluntary initiatives of the doctors. By providing for those in financial need, we destroy the allegations that physicians are insensitive to patients' needs. Legislators agree that if there is no need, regulation is not necessary. Using the state guidelines for the PAAD program, we are using the same criteria for establishing assistance. Although new bills have been reintroduced in the legislature by Karcher and Orechio, passage is not expected if there is implementation and continued success of the courtesy programs.

The objection, "This program will lead to Medicare mills," to the voluntary program is not founded at all. I assume the term "Medicare mill" is a duplication of the Medicaid mill where large-scale entrepreneurs advertise to accept Medicare payment and exploit the patients and the system by increasing volume and utilization and by rendering unnecessary service in a decreased time frame. If anyone is so unethical and unprofessional to be engaged in such practices, he should be reported. I hardly believe such individuals would be waiting for a voluntary program where the payments are not as high as the participation one.

Also, if each of us responds to the needs of our own, there is little need for patients to be funneled into such operations. It is a known fact that patients will not leave a physician whom they trust and like for a discounted price opportunity.

**“A fee-for-service insurance program
with complete office coverage?”**

**I don't
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

When you asked for a fee-for-service insurance program with comprehensive medical coverage, we listened. Because we all share a common concern, the welfare of your patient.

And when you told us fee-for-service had to cover all your in-office claims, we heard you.

Together we've developed Medallion, the best insurance for a healthy practice—and your patients.

Comprehensive fee-for-service.

The insurance program you want with the comprehensive medical coverage your patients need, including office visits, well child care and unlimited laboratory and X-ray services. Just bill your usual charges for each and every service you perform.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

Election Year 1988

HOWARD D. SLOBODIEN, M.D.

The July 8/15, 1988, issue of the *American Medical News* should be required reading for all who

care about the delivery of medical and health care in this country. Reportage of the actions of the House of Delegates to the AMA at the annual meeting in June occupies the bulk of the publication, but other items deserve attention. I shall not critique the work of the House; members of our delegation will attend to this. But allow me to comment on other reported items—not part of the official deliberations at the annual meeting.

AMPAC (American Medical Political Action Committee) sponsored a program called "Participation '88." Speakers included David Blumenthal, M.D., senior vice-president of the Brigham and Woman's Hospital, Boston, previously an aide to Senator Edward Kennedy and now a health advisor to Governor Dukakis; and Barbara Rockett, M.D., who "interacts" on health issues with the Bush campaign, is a practicing surgeon from Brookline, and is past-president of the Massachusetts Medical Society.

Dr. Rockett spoke of the exodus of physicians from Massachusetts and the development of alternate life-

styles, e.g., carpentry, by some who remained, but not as physicians. She discussed the four M's: Medicare, Medicaid, Malpractice, and the Miracle that patient care in Massachusetts has survived at all in light of the problems posed by the first three M's. She apparently had little to say about Vice-President Bush's health care plans.

Dr. Blumenthal noted that Massachusetts, despite the exodus, had the third highest ratio of doctors to population in the 50 states. He pointed to the "blight upon our national conscience that 37 million Americans—one third of them children—do not have any form of health insurance." The health plank of his party states, in part, "Federal coordination and leadership are necessary to contain health care costs while assuring quality care, basic insurance coverage, and advanced medical research."

Princeton University's Uwe Reinhardt, speaking to medical students at their annual luncheon, told them to get out of health care and into hula hoops if they opposed government interference in their work. According to the report in *American Medical News*, he also felt that physicians should be the ones to solve the problem of the 37 million uninsured, "to get them insured." Of course, taxes would have to be raised. Yet, he also implied that doctors should be able to allocate properly the finite sum granted them by the government and other payors, to be able to live within a budget and to see the big (macro) picture—a typical posture from one who never treated a patient and cannot be concerned with the individual (micro) person. If only these soothsayers could be compelled to shoulder their just liability in the courts!

It also is interesting to note that Dr. Reinhardt professes to know the proper percentage of the gross national product to be spent for health care, yet he seems not to know why Medicare expenditures rose more than twice as much as health expenditures for all other Americans in the last decade. But, after 1987, what can we expect from economists?

If you believe that politicians, bureaucrats, and economists know what is best for the American patient and the American physician, do nothing.

If you believe that politicians, bureaucrats, and economists do not know what's best for the American patient and the American physician, but will have their way in any event, do nothing.

But, if you believe that they do not know what is best, and that medicine is too important not to be left, for the most part, to physicians, now is the time to give careful attention to "social ethics in the political arena," as Uwe Reinhardt phrases it—but perhaps not exactly as he intends it. Now is the time for you, your family, and your friends to participate actively during this most important election year. Money helps. Working for the candidate of your choice is even better. And voting is essential.

ALLERGIC BRONCHOPULMONARY ASPERGILLOSIS: REPORT OF THREE CASES

LEONARD BIELORY, M.D., ADENIYI OGUNKOYA, M.D., ROBERT RESTIFO, D.O.,
CHRISTINE L. HOLLAND, M.D., NEWARK*

Allergic bronchopulmonary aspergillosis (ABPA) is not an uncommon complication of chronic asthma. We found the prevalence of ABPA to be 10 percent of randomly sampled asthmatic patients (inpatient and outpatient) and suggest that the prevalence of ABPA is more frequent than previously appreciated by many physicians.

Aspergillosis is a disease caused by the dimorphic fungus *Aspergillus*, whose species are ubiquitous in nature. The responsible species causing human disease almost invariably is *Aspergillus fumigatus*.¹ The spectrum of *Aspergillus* lung diseases includes primary invasive aspergillosis, mycetoma, and hypersensitivity states. We report three cases of allergic bronchopulmonary aspergillosis (ABPA) from University Hospital's Division of Allergy and Immunology, as part of an ongoing study for the evaluation of ABPA in the general asthmatic population.

METHODS

Allergic bronchopulmonary aspergillosis was diagnosed according to the criteria defined by Patterson^{2,14} which included asthma, and five of the following: peripheral blood eosinophilia, immediate skin reactivity against *A. fumigatus*, presence of precipitating antibodies to *A. fumigatus* antigen, elevated total serum IgE, specific IgE to *A. fumigatus*, and abnormal chest radiographs including pulmonary infiltrates and/or central bronchiectasis (Table).

Patients were obtained from random sampling of the general asthmatic population at UMDNJ-New Jersey Medical School/University Hospital and those asthmatic patients specifically referred for the evaluation of ABPA.

Serum total IgE levels were performed using an enzyme-linked immunoassay.^{3**} Specific serum IgE levels to *A. fumigatus* antigen were performed with the fluorometric modified radioallergosorbent test (RAST).^{**} Precipitins were performed using neat sera (unconcentrated) against several *Aspergillus* species including *A. fumigatus*, *A. niger*, and *A. flavus*.[†] The Ouchterlony plates were prepared according to the Mancini technique.^{4,5}

Epicutaneous (prick; 1:20 dilution) and intradermal (0.2 ml; 1:1000 dilution) skin tests for immediate hypersensitivity were performed with *Aspergillus* antigens from various sources (National Aspergillosis Registry Antigen, Greer Laboratories, and Center Laboratories). Prick and intradermal skin tests were applied to the volar aspect of the forearm or the lateral aspect of the upper arm. Histamine phosphate (1.0 mg histamine/ml, Eli Lilly & Co., Indianapolis, Indiana) was used as the positive control. Phenolic saline was used as the negative control. Results were determined at 15 minutes after prick and intradermal testing by taking two measurements of the reaction (wheal and

TABLE
Prevalence of Clinical and
Laboratory Findings in ABPA

Criteria	Incidence in ABPA
Asthma	100%
Positive skin test	100%
Elevated IgE (> 500 IU/ml)	100%
<i>A. fumigatus</i> specific IgE	91%
Pulmonary infiltrate	80-90%*
Positive precipitins	69%**
Eosinophilia	66%
Central bronchiectasis	41%†

*Homogeneous shadows present (fleeting infiltrates).

**Incidence greater than 90 percent when serum is concentrated threefold to fourfold.

†41 percent found in this series as a permanent finding.

flare), the longest diameter, and at 90 degrees to the longest diameter.

CASE REPORT 1

A 24-year-old black male, with a history of asthma since age 3, had multiple exacerbations requiring emergency room visits and hospital admissions to UMDNJ-University Hospital. Precipitating factors of his asthma include warm weather, exposure to dusts, and upper respiratory infections. The patient denied aspirin sensitivity, and does not smoke, consume alcohol, or use illicit drugs. The patient's mother, brother, sister, and daughter have asthma. Current medications included: theophylline (Theo-Dur®) 300 mg three times a day, metaproterenol (Alupent®) metered-dose inhaler (2 inhalations) four times a day, and prednisone (Deltasone®) 10 mg daily. Physical examination revealed bilateral expiratory wheezes.

The laboratory examination revealed IgE of 799 IU/ml, eosinophil count of 328 cells/ml (on steroids), positive *A. fumigatus* immediate skin test, positive precipitins, and positive *A. fumigatus* specific IgE. The chest radiograph revealed central bronchiectasis and infiltrates. Pulmonary function tests revealed severe airway obstruction with significant response to bronchodilators, with a minimal restrictive defect. The patient presently is controlled with steroids and bronchodilators. No followup IgE level has been obtained.

CASE REPORT 2

A 7-year-old Hispanic male had a history of asthma since six months of age exacerbated by dusts, exercise, pollens, and aeroallergens. The patient's family denied drug hypersensitivity including aspirin. He was referred to the Division of Allergy and Immunology for the evaluation of ABPA; he had an elevated IgE level and x-ray evidence of central bronchiectasis. Family members with asthma and allergies include maternal relatives, two brothers, and four sisters. Current medications included theophylline (Slo-bid™) 300 mg daily, and prednisone (Deltasone®) 5 mg daily. Auscultation of the chest did not reveal any wheezing.

The laboratory examination revealed IgE of 2207 IU/ml, eosinophil count of 330 cells/ml (on steroids), positive *A. fumigatus* immediate skin test, positive precipitins, and positive *A. fumigatus* specific IgE. The sweat chloride measurement was <15 mEq/L (levels >60 mEq/L indicate cystic fibrosis). The chest radiograph revealed central bronchiectasis. The patient was continued on his usual bronchodilator regimen while steroids were increased to a dose of 0.5 mg/kg/day for two months and then switched to an alternate day regimen. Three months later, the patient was asymptomatic with the serum IgE level falling to 78.5 IU/ml.

CASE REPORT 3

A 25-year-old black male had a history of asthma since childhood and suffered multiple exacerbations requiring hospitalizations. Symptoms were exacerbated by exposure to dusty environments, warm humid weather, grasses, and upper respiratory infections. The patient had a history of allergies to pollen, grasses, and dust. He denied drug allergies or aspirin sensitivity. The patient's mother and brother have asthma. The patient smokes one pack of cigarettes per day, occasionally consumes alcohol, and uses intranasal cocaine. Physical examination revealed mild expiratory wheezes. Medications included theophylline (Theo-Dur®) 900 mg daily, metaproterenol (Alupent®) metered-dose inhaler (two inhalations) four times a day, and prednisone (Deltasone®) 10 mg daily.

The laboratory examination revealed IgE of 3534 IU/ml, eosinophil count of 405 cells/ml (on steroids), positive *A. fumigatus* immediate skin test, positive precipitins, and positive *A. fumigatus* specific IgE. An old chest radiograph revealed a right upper lobe infiltrate which resolved and then recurred two years later. The patient continued his usual regimen of bronchodilators, and prednisone (0.5 mg/kg/day) was prescribed. The IgE level fell to 389 IU/ml after four weeks of treatment with clinical resolution of his wheezing.

DISCUSSION

Allergic bronchopulmonary aspergillosis now has been recognized as a complication of asthma. It first was described in 1952 in asthmatics of the United Kingdom⁶ and then in the United States in 1968. The incidence of ABPA in the original study in the United Kingdom was 22 percent, but 9 percent in steroid-dependent asthmatics of North America.⁷ The incidence of ABPA has been reported to be unknown in unselected populations of asthmatics.⁸ An ongoing study by the Division of Allergy and Immunology at UMDNJ-University Hospital, has shown that in a series of 20 randomly selected asthmatics followed in the hospital and clinic setting, 10 percent met the criteria for the diagnosis of ABPA while an increased prevalence of 70 percent was noted in asthmatic patients (n=10) specifically referred for the evaluation of suspected ABPA.⁹ These statistics reflect a higher incidence than previously suspected, and physicians evaluating recalcitrant asthmatic patients or practicing in other inner-city settings should consider this diagnosis when appropriate.

Hypersensitive IgE-mediated pulmonary disorders associated with *Aspergillus* or *Candida* are unique in terms of the inflammatory response. The fungus actu-

ally colonizes and grows into the surrounding pulmonary tissue which subsequently generates a cell-mediated and humoral (IgE and IgG) immunological response.¹⁰ The monitoring of IgE levels in ABPA patients may be a helpful predictor of disease activity: rising IgE levels are very indicative of a flare, whereas a stable or decreasing value implicates disease remission as exemplified in case reports 2 and 3.¹⁰

The diagnostic criteria for ABPA and the prevalence of these clinical findings, as found in other studies, were similar to those found in our study (Table).^{2,8,9,14-16} In our patients, the most significant of the criteria for the diagnosis of ABPA was the immediate sensitivity to *A. fumigatus* antigen, as our patients with ABPA uniformly have a positive, immediate (wheal and flare) reaction to *Aspergillus*. A nonreactive test virtually excludes the diagnosis. All three patients had positive immediate hypersensitivity skin tests. They also had elevated IgE level (799, 3534, and 2207 IU/ml) and specific IgE and positive precipitins, but only two of the patients had central bronchiectasis. Total eosinophil counts were misleading since many of the patients were on glucocorticosteroids which physiologically lower the level of circulating eosinophils.

Some of the discrepancies in the estimates of the incidence of ABPA in asthmatic populations are due to antigen selection and the lack of standardization of *A. fumigatus* antigen for clinical testing. It has been shown that commercially prepared antigen often did not induce positive skin tests and serum precipitating antibodies in patients with ABPA.¹² At the present time, there is a National Aspergillosis Registry for the evaluation and standardization of such an antigen in which our group at the Division of Allergy and Immunology of the New Jersey Medical School is participating.

Another diagnostic criteria has been the presence of serum precipitating antibodies to *Aspergillus*. They are present in approximately 50 percent of ABPA patients when the serum is tested in a neat (unconcentrated) form and in 92 percent of ABPA patients when the serum is concentrated. However, serum precipitins are not specific for ABPA.¹³

A practical approach to the diagnosis of ABPA in difficult-to-manage asthmatics without bronchiectasis is to perform an adequate *A. fumigatus* antigen immediate skin test. If the skin test is negative, then one should consider an alternate diagnosis. If the skin test is positive, then a total IgE level, specific *A. fumigatus*, IgE (RAST), and *A. fumigatus* precipitins should be obtained. The presence of an elevated IgE with the presence of specific antibodies, IgG (precipitin) and/or IgE (RAST), is highly suggestive that the patient has ABPA and would be classified as ABPA-S, i.e. bronchiectasis is absent but clinical and serologic features of ABPA are consistent with its diagnosis.¹⁴

We recommend that a panel of *A. fumigatus* antigens from various sources be used for immediate cutaneous testing in patients with suspected ABPA since it is apparent from our studies that not all commercial *Aspergillus* extracts contact the same antigens.

SUMMARY

Allergic bronchopulmonary aspergillosis is found in approximately 9 to 22 percent of steroid-dependent

asthmatics depending on site of population. All of our patients have a positive immediate (IgE-mediated) skin test and satisfied the criteria of ABPA.

The current recommendations for treatment include the use of prednisone 0.5 mg/kg/day for two weeks then alternate day therapy at the same dose for three to six months. Total IgE levels should be obtained monthly and a chest roentgenograph should be obtained every three months for the first year. Exacerbations can be detected by the doubling of the IgE level and/or appearance of chest roentgenographic infiltrate.

CONCLUSION

It is hoped that this review will result in the earlier diagnosis of ABPA and the immediate initiation of appropriate medical therapy that includes glucocorticosteroids. Intervention at an earlier stage may reduce the associated long-term sequelae such as bronchiectasis, interstitial lung disease, and chronic obstructive pulmonary disease.

THEO-DUR[®]

THEOPHYLLINE (Anhydrous)

Sustained Action Tablets

INDICATIONS: THEO-DUR is indicated for relief and/or prevention of symptoms of asthma and for reversible bronchospasm associated with chronic bronchitis and emphysema.

CONTRAINDICATIONS: THEO-DUR is contraindicated in individuals who have shown hypersensitivity to theophylline or any of the tablet components.

WARNINGS: Status asthmaticus should be considered a medical emergency and is defined as that degree of bronchospasm which is not rapidly responsive to usual doses of conventional bronchodilators. Optimal therapy for such patients frequently requires both *additional medication*, parenterally administered, and *close monitoring*, preferably in an intensive care setting.

Although increasing the dose of theophylline may bring about relief, such treatment may be associated with toxicity. The likelihood of such toxicity developing increases significantly when the serum theophylline concentration exceeds 20 mcg/ml. Therefore, determination of serum theophylline levels is recommended to assure maximal benefit without excessive risk.

Serum levels above 20 mcg/ml are rarely found after appropriate administration of recommended doses. However, in individuals in whom theophylline plasma clearance is reduced for any reason, even conventional doses may result in increased serum levels and potential toxicity. Reduced theophylline clearance has been documented in the following readily identifiable groups: 1) patients with impaired renal or liver function; 2) patients over 55 years of age, particularly males and those with chronic lung disease; 3) those with cardiac failure from any cause; 4) neonates; and 5) those patients taking certain drugs (macrolide antibiotics and cimetidine). Decreased clearance of theophylline may be associated with either influenza immunization or active infection with influenza.

Reduction of dosage and laboratory monitoring is especially appropriate in the above individuals. Less serious signs of theophylline toxicity (i.e. nausea and restlessness) may occur frequently when initiating therapy, but are usually transient, when such signs are persistent during maintenance therapy, they are often associated with serum concentrations above 20 mcg/ml. Unfortunately, however, serious side effects such as ventricular arrhythmias, convulsions or even death may appear as the first sign of toxicity without any previous warning. Stated differently: *serious toxicity is not reliably preceded by less severe side effects.*

Many patients who require theophylline may exhibit tachycardia due to their underlying disease process so that the cause/effect relationship to elevated serum theophylline concentrations may not be appreciated.

Theophylline products may cause dysrhythmia and/or worsen pre-existing arrhythmias and any significant change in rate and/or rhythm warrants monitoring and further investigation.

The occurrence of arrhythmias and sudden death (with histological evidence of necrosis of the myocardium) has been recorded in laboratory animals (minipigs, rodents and dogs) when theophylline and beta agonists were administered concomitantly, although not when either was administered alone. The significance of these findings when applied to human usage is currently unknown.

PRECAUTIONS: THEO-DUR TABLETS SHOULD NOT BE CHEWED OR CRUSHED.

General: Theophylline half-life is shorter in smokers than in non-smokers. Therefore, smokers may require larger or more frequent doses. Morphine and curare should be used with caution in patients with airway obstruction as they may suppress respiration and stimulate histamine release. Alternative drugs should be used when possible. Theophylline should not be administered concurrently with other xanthine medications. Use with caution in patients with severe cardiac disease, severe hypoxemia, hypertension, hyperthyroidism, acute myocardial injury, cor pulmonale, congestive heart failure, liver disease, in the elderly (especially males) and in neonates. In particular, great caution should be used in giving theophylline to patients with congestive heart failure. Frequently, such patients have markedly prolonged theophylline serum levels with theophylline persisting in serum for long periods following discontinuation of the drug. Individuals who are rapid metabolizers of theophylline, such as the young, smokers, and some non-smoking adults, may not be suitable candidates for once-daily dosing. These individuals will generally need to be dosed at 12 hour or sometimes 8 hour intervals. Such patients may exhibit symptoms of bronchospasm near the end of a dosing interval, or may have wider peak-to-trough differences than desired.

Use theophylline cautiously in patients with history of peptic ulcer. Theophylline may occasionally act as a local irritant to the G.I. tract although gastrointestinal symptoms are more commonly centrally mediated and associated with serum drug concentrations over 20 mcg/ml.

Information for Patients: The physician should reinforce the importance of taking only the prescribed dose and time interval between doses. THEO-DUR tablets should not be chewed or crushed. When dosing THEO-DUR on a once daily (q24h) basis, tablets should be taken whole and not split. As with any controlled-release theophylline product, the patient should alert the physician if symptoms occur repeatedly, especially near the end of the dosing interval.

DRUG INTERACTIONS: Drug-Drug: Toxic synergism with epinephrine has been documented and may occur with some other sympathomimetic bronchodilators. In addition, the following drug interactions have been demonstrated:

Drug	Effect
Theophylline with lithium carbonate	Increased excretion of lithium carbonate
Theophylline with propranolol	Antagonism of propranolol effect
Theophylline with cimetidine	Increased theophylline blood levels
Theophylline with troleandomycin, erythromycin	Increased theophylline blood levels

Drug-Food: THEO-DUR 100 mg Sustained Action Tablets have not been adequately studied to determine whether their bioavailability is altered when given with food. Available data suggest that drug administration at the time of food ingestion may influence the absorption characteristics of theophylline controlled-release products resulting in serum values different from those found after administration in the fasting state.

A drug-food effect, if any, would likely have its greatest clinical significance when high theophylline serum levels are being maintained and/or when large single doses (greater than 13 mg/kg or 900 mg) of a controlled-release theophylline product are given.

THEO-DUR (200, 300, and 450 mg) Sustained Action Tablets: The rate and extent of absorption of theophylline from THEO-DUR 200 mg, 300 mg, and 450 mg tablets when administered fasting or immediately after a moderately high fat content breakfast is similar.

Drug-Laboratory Test Interactions: When plasma levels of theophylline are measured by spectrophotometric methods, coffee, tea, cola beverages, chocolate, and acetaminophen contribute falsely high values.

Carcinogenesis, Mutagenesis, and Impairment of Fertility: Long-term animal studies have not been performed to evaluate the carcinogenic potential, mutagenic potential, or the effect on fertility of xanthine compounds.

Pregnancy: Category C—Animal reproduction studies have not been conducted with theophylline. It is not known whether theophylline can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Xanthines should be given to a pregnant woman only if clearly needed.

Nursing Mothers: It has been reported that theophylline distributes readily into breast milk and may cause adverse effects in the infant. Caution must be used if prescribing xanthine to a mother who is nursing, taking into account the risk-benefit of this therapy.

Pediatric Use: Safety and effectiveness of THEO-DUR administered:

1. Every 24 hours in children under 12 years of age, have not been established.
2. Every 12 hours in children under 6 years of age, have not been established.

ADVERSE REACTIONS: The most consistent adverse reactions are usually due to overdose and are:

1. **Gastrointestinal:** nausea, vomiting, epigastric pain, hematemesis, diarrhea.
2. **Central nervous system:** headaches, irritability, restlessness, insomnia, reflex hyperexcitability, muscle twitching, clonic and tonic generalized convulsions.
3. **Cardiovascular:** palpitation, tachycardia, extrasystoles, flushing, hypotension, circulatory failure, ventricular arrhythmias.

4. **Respiratory:** tachypnea.
5. **Renal:** albuminuria, increased excretion of renal tubular and red blood cells, potentiation of diuresis.

Other: rash, hyperglycemia and inappropriate AOH syndrome.

OVERDOSSAGE: Management: If potential oral overdose is established and seizure has not occurred:

- A. Induce vomiting.
 - B. Administer a cathartic (this is particularly important if sustained-release preparations have been taken).
 - C. Administer activated charcoal.
- If patient is having a seizure:
- A. Establish an airway.
 - B. Administer oxygen.
 - C. Treat the seizure with intravenous diazepam, 0.1 to 0.3 mg/kg up to 10 mg.
 - D. Monitor vital signs, maintain blood pressure and provide adequate hydration.

Post Seizure Care:

- A. Maintain airway and oxygenation.
- B. If a result of oral medication, follow above recommendations to prevent absorption of the drug, but intubation and lavage will have to be performed instead of inducing emesis, and the cathartic and charcoal will need to be introduced via a large bore gastric lavage tube.
- C. Continue to provide full supportive care and adequate hydration while waiting for drug to be metabolized. In general, the drug is metabolized sufficiently rapid so as not to warrant consideration of dialysis; however, if serum levels exceed 50 mcg/ml charcoal hemoperfusion may be indicated.

CAUTION: Federal law prohibits dispensing without prescription. For full prescribing information, see package insert. Revised 6/87

LIMITING TREATMENT: A GUIDE FOR THE PERPLEXED

MICHAEL A. NEVINS, M.D., RIVER VALE*

Decisions to withdraw or withhold medical treatment combine medical, ethical, and legal dimensions. Guidelines are provided that enunciate general principles of decision making, specific questions that should be addressed, and a medical-legal framework based on court decisions in New Jersey.

Deciding to withhold or withdraw medical treatment is never easy, nor should it be. Nonetheless, recent events suggest that many clinicians are perturbed about how to proceed when beset simultaneously by medical, moral, and legal questions that often lack clear answers.

Consider the following terse three line progress note written by an otolaryngology resident in the chart of a mentally competent patient with advanced laryngeal cancer: "Patient refused bronchoscopy. Haldol® given. Administrative consent obtained."

The Hippocratic oath calls for physicians to do what, in their opinion, would benefit the patient—but this can be carried too far! When patients disagree with us, are they necessarily crazy?

A different form of medical paternalism was displayed in the infamous "Debbie affair" reported first in the *Journal of the American Medical Association*, and later in newspapers and magazines throughout the country.¹ An obstetrics/gynecology resident administered a lethal dose of morphine to a woman dying of metastatic cancer whom he had never seen before in order to end the patient's suffering. Is it permissible to take the law into our own hands, so long as we are acting compassionately in what we believe to be a patient's best interests?

Consider still another scenario in New Jersey—a

competent woman with endstage amyotrophic lateral sclerosis (ALS) lives at home, has been on a respirator and feeding tube for three years, and is competent and communicative by eye blink. She asks that the respirator be turned off; the family concurs and two psychiatrists agree that she understands the consequences of what she is requesting. Only a few months before, the Supreme Court of New Jersey, in virtually identical circumstances in the Kathleen Farrell case, had declared that it was a legally permissible option to terminate all forms of life support.² Yet, the responsible physician refuses to comply with the patient's request, withdraws from the case, and 23 other physicians decline to become involved in the final management. No doubt, some had legitimate reasons and, admittedly, there is a fine line between active and passive euthanasia here, but many just did not want to get involved out of fear of legal entanglement. Even the explicit backing of New Jersey's Supreme Court was insufficient to overcome their anxieties.

These three anecdotes indicate that something is seriously amiss! Too often decisions are being made

TABLE 1

General Principles Regarding Limited Treatment***1. Treatment Goals**

a. There is no obligation to provide medical care where intervention is determined by a physician to be nonbeneficial in that

- I) it would be virtually futile and unlikely to improve the patient's prognosis or
- II) the burdens to the patient that would result from the treatment substantially outweigh its potential benefits.

b. It is appropriate to withhold or remove enteral or parenteral nutrition or hydration from irreversibly ill patients according to the same criteria employed to determine the rejection of other life-saving or sustaining treatments such as mechanical respiratory support. Of course, there continues to be a firm obligation to provide adequate comfort care during this period.

c. Imminent death is not the only situation in which comfort-oriented care is ethical; other important considerations are the presence of severe physical pain or the reasonable certainty of permanent loss of those qualities that generally are thought to constitute human personhood.

2. MD-Patient Relationship

a. The freedom to choose or to reject life-sustaining medical care emanates from the constitutional right of privacy; a competent individual has the legal right to make what some people might consider to be the "wrong" decision.

b. Treatment decisions on behalf of the incompetent hopelessly ill should be made according to the best available evidence of what the patient's preferences would be if he or she were competent. If there is no such evidence, decisions should be based upon assessments of the patient's "best interests."

c. Personal medical decisions of irreversibly ill patients or their surrogates should not be subjected to public scrutiny except in the rare case that intervention is necessary to reconcile the views of the parties involved. Family members are presumed to be appropriate surrogate decision makers for patients diagnosed as being incapable of giving informed consent. If this presumption is rebutted for any reason, such as a conflict of opinion between two close relatives or evidence of prior familial neglect, then it is appropriate to seek guidance or consultation from others, but only in cases of irreconcilable conflict.

3. Special Considerations

a. Whereas these principles are universally applicable, the processes of decision making similarly should be substantially independent of the venue of treatment, lest decisions about where care is rendered are made inappropriately on the basis of procedural issues rather than on the basis of what is in the patient's best interest. The process itself should not impose undue additional burden on patient and/or family.

b. Institutional policy that usurps an individual's right to decline any form of medical care abrogates the fundamental autonomy of patients.

c. Wise decision making requires reasonable flexibility and a certain discretionary space that must be preserved, lest the physician's clinical skills be severely compromised. The prolonged time frame of judicial review and the inevitable recourse to rigid formulae by government agencies make them unsuited as participants in what necessarily is an uncertain and changing decision-making process in "the crucible of the bedside."

*Statement approved by NJ-ACP Chapter Council, Oct. 16, 1986.

TABLE 2

**Elements To Be Addressed When
Contemplating Limited Treatment**

1. Is the patient completely or partially capable of participating in decision making? If not, what is the incapacity that precludes participation?

2. What is the patient's wish (general and/or specific)? Is there any reason to believe that it has been coerced or reflects pathologic depression?

3. Is there written evidence of patient's wishes? If yes, it should be included in the medical record. If the evidence is only oral, nonetheless it too should be reported in the record. How current is the patient's expression? How explicit? How applicable to the present circumstances? How clear and convincing?

4. Has the patient expressed an opinion regarding such specific forms of treatment as resuscitation (DNR), intubation, use of a respirator, artificial feeding, dialysis, surgery, or other forms of treatment? If so, these details also should be recorded in the chart.

5. If the patient is incapable of participating in decision making, have they legally designated a surrogate? If not, who speaks for the patient and to what extent are they familiar with the patient's wishes?

6. Is there any reasonable evidence of conflict of interest, family discord, or an irreconcilable disagreement between the treating health team and patient/family? If so, would consultation with an ethics committee or another individual or group be helpful?

7. What are the major medical conditions? Does the patient suffer from an incurable and inevitably fatal disease? Is the condition "terminal" or is death imminent regardless of medical treatment? Is the patient suffering refractory pain? Is the patient permanently unconscious? Is there irreversible organ failure?

8. Has sufficient time elapsed and appropriate consultation been obtained to be reasonably certain both of the diagnosis and prognosis?

9. Are there any religious, legal, or social considerations or factors related to availability of scarce resources that might serve to qualify the patient's autonomous rights?

10. As treating physician, if you do not fully agree with the informed decision made by the patient/surrogate, are you comfortable in accepting the choice, or can a mutually acceptable compromise be made? If not, you may formally contest the decision or withdraw from the case after making a good faith effort to find another physician whose opinion is compatible with the patient/surrogate.

without sufficient thought or attention to moral, legal, and professional principles. Paradigmatic decision making involves a dialectic that neither is overbalanced in favor of the physician's viewpoint nor that of the patient or representative. Since both sides have rights and responsibilities that need to be addressed, the process of decision making may take time and may require a certain amount of negotiation and even bargaining. Nonetheless, it is irresponsible for clinicians to dismiss the broader issues by retreating into purely technical considerations.

By now, scholarly groups and professional organizations have agreed upon many of the medical-legal and ethical parameters of what is permissible.³⁴ However, to assert that something is permissible does not mean that it is obligatory. For example, the ethics committees of such national organizations as the American

TABLE 3
Medical-Legal Framework for Treatment Termination Decisions*

Mental Status	Patient's Choice (Clear and Convincing)	NJ Precedent	Standard	Procedure	Comments
Competent	Yes	K. Farrell, 37 yo. ALS, at home on respirator.	Patient has right to self-determi- nation.	Two MDs confirm patient's understanding of alternatives.	Applicable regardless of where being treated—home, NH, or hospital. Patient's wishes supercede institution's.
Incompetent, "permanently unconscious" (coma or PVS)	Yes	B. Requena, 55 yo, ALS, in hospital, feeding tube. H. Peter, 65 yo, in NH, feeding tube.	Patient's wishes outweigh condition or prognosis.	Two MDs confirm diagnosis/prog- nosis. In hospital consult ethics commit- tee, in NH with ombudsman.	Substituted judgment by surrogate— what would the patient choose if able? Ombudsman should defer to the surrogate.
	No	K. Quinlan, 21 yo, in hospital, on respirator. N. Jobes, 32 yo, in NH, feeding tube.	No likelihood of return to cognitive/sa- pient state.	Same as above.	Most people would consider permanent coma or PVS to be unendurable.
Incompetent severely disabled, some limited respon- siveness	Yes	—	"Subjective test"—some probitive evidence of patient choice.	Same as above but life expectancy one year or less even with Rx.	
	Equivocal	—	"Limited-objec- tive test," combines ele- ments of self-determina- tion and best interests.	Same as above.	
	No	C. Conroy, 81 yo, in NH, feeding tube. E. Visbeck, 90 yo, hospital, feeding tube.	"Objective test"—burdens of Rx clearly outweigh benefits. Physi- cal pain such that further Rx would be inhumane.	Same as above.	Conroy already had died. Court did not rule in her case since she didn't meet any of the three test standards. Factors other than pain can be considered, but if there are some positive interactive qualities and only minimal discomfort, benefits outweigh burdens.

Abbreviations: yo = year-old; NH = nursing home; ALS = amyotrophic lateral sclerosis; PVS = persistent vegetative state.

*Reprinted with permission from the American Geriatrics Society, by Michael Nevins (*J Am Geriatr Soc* 36:476-479, 1988).

Medical Association and the American College of Physicians, as well as their New Jersey component groups, have formally acknowledged that medical treatment, even including artificial methods of hydration and nutrition, may be eschewed under certain circumstances. There are questions that still are to be answered: When are those times? Under what situations?

Tables 1, 2, and 3 may be useful as guidelines for sound clinical decision making. Table 1 lists general principles approved in 1986 by the Executive Council of the New Jersey Chapter of the American College of Physicians. Later, these were used as the cornerstone of the Chapter's *amicus curiae* brief in the case of Nancy Jobes. On June 24, 1987, the Supreme Court of New Jersey rendered its decision in the Jobes, Peter, Farrell trilogy, and it addressed and endorsed each of these principles.

Table 2 lists specific elements that should be addressed whenever decisions are being contemplated to limit medical treatment. It is not proposed as the definitive checklist; indeed, "cookbook" approaches run the risk of failing to address ethical nuances. Table 2 should be considered as a starting point which by no means exhausts all of the significant concerns. Optimally, this information should be recorded directly in the patient's chart lest there be any ambiguity about the treatment strategy or the process of decision making. In individual cases, it may be prudent to consult with local authorities regarding institutional policy, state law, and other considerations. When available, an

institutional ethics committee can serve as an excellent forum for further consultation and review.

Table 3 provides a medical-legal framework for treatment termination decisions based in the New Jersey courts between 1976 and 1987. The judicial focus is necessarily narrow, directed only at the case under review and like cases. In the Conroy case, our Supreme Court acknowledged that it is the role of legislature to develop broad overarching statutory law to encompass all contingencies. Toward that end, the New Jersey Bioethics Commission was formed to provide scholarly review and to advise the legislature. That process currently is underway and it remains to be seen to what extent the legislative and judicial perspectives will prove to be congruent. In the meantime, the material contained in the three Tables should serve as a reasonable guide for the perplexed clinician who is concerned about how to respond when beset with complex medical-ethical and legal problems.

LIMITING TREATMENT: A GUIDE FOR THE PERPLEXED

MICHAEL A. NEVINS, M.D., RIVER VALE*

Decisions to withdraw or withhold medical treatment combine medical, ethical, and legal dimensions. Guidelines are provided that enunciate general principles of decision making, specific questions that should be addressed, and a medical-legal framework based on court decisions in New Jersey.

Deciding to withhold or withdraw medical treatment is never easy, nor should it be. Nonetheless, recent events suggest that many clinicians are perturbed about how to proceed when beset simultaneously by medical, moral, and legal questions that often lack clear answers.

Consider the following terse three line progress note written by an otolaryngology resident in the chart of a mentally competent patient with advanced laryngeal cancer: "Patient refused bronchoscopy. Haldol® given. Administrative consent obtained."

The Hippocratic oath calls for physicians to do what, in their opinion, would benefit the patient—but this can be carried too far! When patients disagree with us, are they necessarily crazy?

A different form of medical paternalism was displayed in the infamous "Debbie affair" reported first in the *Journal of the American Medical Association*, and later in newspapers and magazines throughout the country.¹ An obstetrics/gynecology resident administered a lethal dose of morphine to a woman dying of metastatic cancer whom he had never seen before in order to end the patient's suffering. Is it permissible to take the law into our own hands, so long as we are acting compassionately in what we believe to be a patient's best interests?

Consider still another scenario in New Jersey—a

competent woman with endstage amyotrophic lateral sclerosis (ALS) lives at home, has been on a respirator and feeding tube for three years, and is competent and communicative by eye blink. She asks that the respirator be turned off; the family concurs and two psychiatrists agree that she understands the consequences of what she is requesting. Only a few months before, the Supreme Court of New Jersey, in virtually identical circumstances in the Kathleen Farrell case, had declared that it was a legally permissible option to terminate all forms of life support.² Yet, the responsible physician refuses to comply with the patient's request, withdraws from the case, and 23 other physicians decline to become involved in the final management. No doubt, some had legitimate reasons and, admittedly, there is a fine line between active and passive euthanasia here, but many just did not want to get involved out of fear of legal entanglement. Even the explicit backing of New Jersey's Supreme Court was insufficient to overcome their anxieties.

These three anecdotes indicate that something is seriously amiss! Too often decisions are being made

Limbitrol® ④

Tranquillizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.

Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Use in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.

Adverse reactions not reported with Limbitrol but reported with one or both components closely related drugs: **Cardiovascular:** Hypotension, hypertension, tachycardia, palpitation, myocardial infarction, arrhythmias, heart block, stroke. **Psychiatric:** Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. **logic:** Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, ext. pyramidal symptoms, syncope, changes in EEG patterns. **Anticholinergic:** Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. **Allergic:** Skin urticaria, photosensitization, edema of face and tongue, pruritus. **Hematologic:** Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. **Gastrointestinal:** Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, dry tongue. **Endocrine:** Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. **Other:** Head weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe after excessive doses over extended periods; milder after taking continuously at the levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dose. Carefully supervise addiction-prone individuals because of predisposition to habituation/dependence.

Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

ROCHE PRODUCTS INC.
Manati, Puerto Rico 00701

CASE REPORT: CALCIFYING APONEUROTIC FIBROMA

ANIS F. RANGWALA, M.D., ROBERT BATEYKO, M.D., MARGARET SACCO, M.D.,
CYRIL ARVANITIS, M.D., LONG BRANCH

Calcifying aponeurotic fibroma is an uncommon lesion found on the hands and feet of young children. Though the lesion is known to recur, minimal surgical interference is recommended. A case report highlights this lesion with an unusual histological finding occurring on the abdominal wall of an eight-year-old girl.

In 1953, Keasbey reported a lesion characterized by proliferation of connective tissue cells with foci of calcification and varying degrees of chondroid differentiation.¹ She called this lesion juvenile aponeurotic fibroma, stressing its appearance in young children and tendency for recurrence after surgical excision probably associated with its poorly margined and infiltrative growth pattern.

Most of the cases reported have involved hands and feet.² Goldman reported one of seven cases in the abdominal wall.³ We present a second case of this lesion in the abdominal wall with an unusual histological finding.

CASE REPORT

An eight-year-old white female noticed a 2 cm painless lump on the left side of her abdomen. The mass was not fixed to the skin and had not increased in size for two months. There was no history of trauma, no recent infections, and no travel outside the United States. No other masses were detected. Past medical history noted a left inguinal herniorrhaphy four years prior to admission. Physical examination revealed a firm 2 x 1.5 cm mass in the subcutaneous tissue lateral to the left rectus abdominis muscle between the left costal margin and the umbilicus. The mass was freely movable and there was no change in the over-

lying skin. A small scar from the hernia repair was present.

At operation, a 2 x 1.4 x 3 cm irregular firm mass was excised from the rectus abdominis fascia lateral to the left rectus muscle. The mass was located within the fatty subcutaneous tissue and was noted to be infiltrating the rectus fascia. The mass was totally excised along with portions of adjacent muscle tissue and fascia. On cross-section, the mass had a gritty character. The skin and subcutaneous tissue were closed. Four months postoperatively the patient had no recurrence.

Microscopical examination showed the lesion to be unencapsulated (Figure 1), and characterized by diffuse proliferation of fibroblast-like elements that extended into surrounding adipose tissue and skeletal muscle. The spindle-shaped cells were more plump and less mature-looking than those seen in other varieties of fibromatosis, and mitotic figures were fewer than one per ten high-power fields. These cells were arranged in palisading pattern. There were multiple, centrally located foci of calcification and chondroid dif-

*From Monmouth Medical Center where Dr. Rangwala is attending pathologist, Dr. Bateyko is a resident in pathology, Dr. Sacco is a resident in surgery, and Dr. Arvanitis is director of surgery. Correspondence may be addressed to Dr. Rangwala, Department of Pathology, Monmouth Medical Center, Long Branch, NJ 07740.

Figure 1—An uncircumscribed lesion composed of diffuse proliferation of spindle-shaped cells with focal calcification (hematoxylin and eosin stain, 10x).

Figure 2—High-power view of calcifying aponeurotic fibroma showing irregularly branched structures (hematoxylin and eosin stain, 40x).

ferentiation. Multinucleated giant cells were seen in the regions of calcification. An unusual feature was irregularly branched structures vaguely resembling fungal mycelia which stained with elastic stain (Figure 2). (To our knowledge, this latter feature previously has not been described.)

DISCUSSION

Calcifying aponeurotic fibroma is an uncommon lesion usually found on the palms and soles, but also reported in other sites.¹⁻⁷ In 1970, Goldman found an isolated case in the lumbar paravertebral area, and in his own series of seven cases, he also found two additional cases, one case in the neck and the other case in the abdominal wall.

The terminology of this tumor has been controversial. Lichtenstein and Goldman suggested that this tumor be called cartilage analogue of fibromatosis,⁶ based on the concept that in the tumor's late phase, there is prominent degree of calcification and cartilage formation. Keasbey and Fanselau originally named the tumor juvenile aponeurotic fibroma⁸, but changed the term to aponeurotic fibroma because the tumor was not exclusively confined to children. Later, this term was modified further by Iwasaki and Enjoji

to calcifying aponeurotic fibroma,⁹ a term also preferred by Enzinger and Weiss.¹⁰

The majority of cases appear in young children, with an average age of 12 years. However, occasional cases have been reported in the elderly; the oldest patient being 64 years old.³ There appears to be a slight male predominance,² and there is no indication of familial tendency.

The tumor usually is poorly circumscribed and rarely greater than 3 cm in diameter. There is approximately a 50 percent recurrence rate after excision of the tumor. Though these tumors are locally aggressive, Enzinger and Weiss did not report any malignant transformation or metastases.¹⁰

The lesion has a characteristic microscopic appearance. It is highly cellular and composed of spindle-shaped cells with plump, oval nuclei and indistinct cytoplasm separated by densely collagenous stroma. These fibroblastic cells extend with multiple processes into surrounding tissue, giving the lesion a poorly circumscribed appearance. In most areas, these cells predominantly are oriented in one direction giving a linear or palisaded arrangement. The tumor has centrally located foci of calcification and cartilage formation. Not infrequently, the fibrous growth is attached to tendons, aponeurosis, blood vessels, and nerves. Chondroid formation is seen in one third of cases. Osteoid formation is rare. Occasionally, giant cells are found in the vicinity of calcification.

The peculiar branching structures noted on microscopy in the present case and not described previously, are attributed to the destruction of elastic tissue. This destroyed and degenerated elastic tissue may be the site of, and may be responsible for, dystrophic calcification.

For symptomatic tumors, conservative surgical excision is the treatment of choice. Re-excision of a recurrent tumor is preferable to radical or mutilating surgical procedures.

A NEW H₂ Antagonist

AXID[®] 300mg

nizatidine

Effective once-nightly
duodenal ulcer therapy available in a
Unique Convenience Pak
for better patient compliance

AXID[®] nizatidine capsules

Brief Summary. Consult the package insert for prescribing information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients, at a reduced dosage of 150 mg b.i.d. after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H₂-receptor antagonists.

Precautions: General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory tests—False-positive tests for urobilinogen with Multistix[®] may occur during therapy with nizatidine.

Drug Interactions—No interactions have been observed between Axid and theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 60 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose related increase in the density of enterochromatin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high dose males compared to placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement

compared to concurrent controls, and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive, and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery is not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, and the mouse lymphoma assay.

In a two-generation, perinatal and postnatal, fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose, and in Dutch Belted rabbits at doses up to 55 times the human dose, revealed no evidence of impaired fertility or teratogenic effect, but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Nizatidine is secreted and concentrated in the milk of lactating rats. Pups reared by treated lactating rats had depressed growth rates. Although no studies have been conducted in lactating women, nizatidine is assumed to be secreted in human milk, and caution should be exercised when nizatidine is administered to nursing mothers.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Domestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among the more common adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events was also reported; it was not possible to

determine whether these were caused by nizatidine.

Hepatic—Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT [AST], SGPT [ALT], or alkaline phosphatase), occurred in some patients possibly or probably related to nizatidine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L), and in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three times the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hematologic—Fatal thrombocytopenia was reported in a patient who was treated with Axid and another H₂-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine than in placebo patients. Rash and exfoliative dermatitis were also reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported.

Overdosage: There is little clinical experience with overdosage of Axid in humans. If overdosage occurs, use of activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous LD₅₀ values in the rat and mouse were 301 mg/kg and 232 mg/kg respectively.

Toxic Waste Dump.

This November 17, dump cigarettes for the day.
You may even decide to quit for life.

EVERY QUITTER IS A WINNER.
The Great American Smokeout. Nov. 17.

**“A big insurance company
that’s really listening to me?**

**I don’t
believe it.”**

**Believe it!
Medallion.
From Blue Cross and Blue Shield.**

We listened to you because we all share a common concern—the welfare of your patients.

After listening to your needs, we’ve developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you’ll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We’re eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey’s medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate with Blue Cross and Blue Shield.

If you’re not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Call 1-800-842-BLUE for more information. Of course, there’s no obligation.

The best insurance for a healthy practice.

CREATING THE ARCHIVES

LINDA COX, M.L.S., GERALDINE HUTNER, M.A., ROBIN KENNETT*

Will anyone remember the Medical Society of New Jersey? Afraid of what the answer might be, we decided we *would* be remembered. The fruits of such labors have become the archives of the Medical Society of New Jersey, a detailed registry of the history of the oldest medical society in the United States.

The importance of preserving and archiving one's past is not to be taken lightly. Our present depends on where we were and our future depends on where we are today. The lessons we learn from our predecessors are too valuable to be discarded or stored in cardboard boxes. It is in the intrinsic value of our ongoing history that we preserve the art and science of medicine, as are the insights we can pass on to our successors.

The continuing story of the first and oldest medical society of New Jersey was in danger of being lost. (The Medical Society of New Jersey was organized in 1766.) The loss of such an important part of New Jerseyana, Americana, and material medica prompted us to discover a way to save our history.

CREATING AN ARCHIVES

The archives of the Medical Society of New Jersey was created in 1988 with funds provided from a grant by the New Jersey Historical Commission. The purpose of the archives is to organize and preserve important New Jersey medical materials with historical and research value and to make these materials available to all interested persons.

The archives are housed in the editorial office of *NEW JERSEY MEDICINE*, the official publication of the Medical Society of New Jersey. Medical Society of New Jersey members are encouraged to deposit personal papers and documents with the archives. (Materials relating to the medical field and having historical and research value will be added to the collection, and revisions of the registry will be produced.) Inquiries regarding the use of the collection, duplications of any materials located therein, or donations of additional materials should be directed to the editorial office of *NEW JERSEY MEDICINE*, Medical Society of New Jersey, Two Princess Road, Lawrenceville, NJ 08648.

THE COLLECTION

The materials organized within the archives collection are from the files of the Medical Society of New Jersey along with material donated to the Society by former members and their families. The collection includes correspondence, scrapbooks, photographs, newspaper clippings, original pamphlets, original documents, rare and out-of-print books, and a small collection of medical instruments dating from the colonial period. Of particular interest are materials which were gathered from 1938 to 1941 for the 175th anniversary of the founding of the Medical Society of New Jersey; additional historical materials were gathered in 1965 to 1966 during preparations for the bicentennial celebration and for the publication of *The Healing Art*, a history of the Society. The earliest material in the collection includes two New Jersey legislative acts dating from the 18th century, and a page from a physician's account book dated 1794.

Papers and photographs are organized in acid-free folders in acid-free boxes—a total of 47 boxes, occupying 180 linear feet of shelf space. The collection of books along with the *Transactions* and *The Journal* occupy 325 linear feet of shelf space. The *Transactions* and *The Journal* also are available on microfilm. Oversized materials, framed documents, and the medical instruments are stored in a metal cabinet.

ARCHIVAL REGISTRY

The complete archival registry is housed at Society headquarters; all materials have been archived and catalogued. The following pages contain a condensed version of the archival registry; we have prepared this version to assist researchers in determining whether or not there is information in the collection which is relevant to their interests, and to allow readers a glance at the history of the oldest medical society in the United States. A detailed registry and alphabetical finding guide of the collection are available to the public in the archives room.

*Ms. Cox is director of the library, Blair Academy, Blairstown. Ms. Hutner is managing editor and Ms. Kennett is assistant to the managing editor, *NEW JERSEY MEDICINE*, Medical Society of New Jersey, Two Princess Road, Lawrenceville, NJ 08648.

Our cover photograph highlights the archives of the Medical Society of New Jersey. The medical books are a sampling from the rare book collection owned by MSNJ. The medical bag belonged to Jeems Brutus Spradley, MD (1896-1962), a hand-me-down from his family. The original minutes book (open) is from Warren County and dates from 1825. The black fountain pen was used by Governor Robert B. Meyner for official signing. The newspaper, the Bergen Evening Record, was a special edition highlighting the work of the Medical Society, from 1954.

New Jersey is well known for its medical families. The story of the Marsh family begins with Elias Joseph Marsh, MD (top). Born in 1803, Dr. Marsh became the 57th president of the Medical Society of New Jersey in 1850—the year of his death. His portrait has been preserved, as is a certificate dated July 1824 licensing Dr. Marsh to practice physic and surgery throughout the state of New Jersey (left). His son, Dr. Elias J. Marsh (facing page, top) was born in 1835 and became president of the State Society in 1891. He died in 1908. The third generation continued the tradition with Elias Joseph Marsh, MD (facing page, bottom right). Born in 1875, Dr. Elias Joseph Marsh was an active member of the state society and became its 150th president in 1942. He authored a pamphlet, "An Outline History of the Medical Society of New Jersey to 1903," in 1942 (facing page, bottom left) and presented the paper to the New Jersey Historical Society in January of that year. Dr. Marsh died in 1942.

This will Certify, that we, Charles Smith and
Jacob Dunham and John J. ...

...; Censors of the District Medical Society
for the County of Middlesex, appointed by the Medical
Society of New Jersey, have this day carefully and impartial-
ly examined *Elias Joseph Marsh*
of Perth Amboy, County of Middlesex,
and State of New Jersey; and being well satisfied with
his attainments in the various branches of Medical and Surgical Science,
and of his moral character; do hereby recommend him to the President
of the Medical Society of New Jersey, as a proper person, to re-
ceive a licence to practice **PHYSIC** and **SURGERY** throughout the
State of New Jersey.

In testimony whereof, we have hereunto subscribed our names and
affixed our seals, at New Brunswick this 14th
day of July, Anno Domini 1824.

Chas. Smith
Jacob Dunham
John J. ...

*An Outline History of the
Medical Society of New
Jersey to 1903*

BY ELIAS J. MARSH, M. D.
PATERSON

REPRINTED FROM
PROCEEDINGS OF THE NEW JERSEY HISTORICAL SOCIETY
JANUARY, 1942

E. J. Marsh

Wells P. Eagleton, MD (right), was the president of the Medical Society of New Jersey in 1923. On April 26, 1936, Dr. Eagleton (1865-1946) was honored at a testimonial dinner at the Essex House in Newark; the six-page program listed the evening's events and a photograph of Dr. Eagleton (top right). Two years later, on November 16, 1938, Dr. Eagleton presented an address to the Union County Medical Society entitled, "A New Jersey Doctor's and His Wife's 1939 Salutation to his Fellow Practitioners and Their Wives." The speech was published in January 1939 (top left) and distributed to all members of the Medical Society of New Jersey.

Yours very truly,
Wells P. Eagleton
W.P.E.S.

Edward J. Ill, MD (right), served as the 114th president of the Medical Society of New Jersey in 1907. He dedicated himself to his profession and to organized medicine. To honor his achievements, the Academy of Medicine of New Jersey, in 1939—on his 85th birthday—established the Edward J. Ill Award to be presented to a New Jersey physician for his dedication and service to the medical profession. Dr. Eagleton (facing page) was the first recipient of this medal (bottom).

Edward J. Ill

Needing a new headquarters building, the Medical Society of New Jersey purchased the Kuser property (top) in 1944 for \$44,000. The house at 315 West State Street was constructed in 1905 for the well-known Trenton, New Jersey family who lived in the house until 1943. A Committee was appointed by the MSNJ Board of Trustees to oversee the purchase of the property (left to right): Drs. Frank G. Scammell, Andrew F. McBride, Joseph F. Londrigan, president, and Harry R. North.

COMMITTEE ON PUBLICATION:
WILLIAM J. CHANDLER, M.D. DAVID C. ENGLISH, M.D. HENRY W. ELMER, M.D.
RICHARD COLE NEWTON, M.D., Editor.

Vol. I. No. 1. Newark, N. J., September, 1904. Subscriptions, \$2.00 Per Year. Single Copies, 25 Cents.

Address all communications relating to the business of the paper, advertisements and subscriptions to
WILLIAM J. CHANDLER, M.D., 105 South Orange Ave., South Orange, N.J.
Address all papers on medical subjects, all news items, and all books for review to RICHARD C. NEWTON, M.D.,
105 South Orange Ave., South Orange, N.J.
The Journal will be glad to print original papers from any source, preferably from members of the State
Society, provided that they will be of sufficient merit and shall be contributed to this paper exclusively.
As to news communications will not be published, but the name of the author of a communication will
be kept secret if the editor is requested to do so.
The Medical Society of New Jersey does not hold itself responsible for the sentiments expressed by the authors
of papers.
It will be satisfactory to all concerned if authors will have their contributions typewritten before submitting
them for publication. The expense is small—the author's gain is great to the editor and printer. We
do not promise to return unused manuscripts.

ANNOUNCEMENT BY THE COMMITTEE ON PUBLICATION.

The Medical Society of New Jersey at its
annual meeting favorably considered
the idea of journalizing its transactions, but
left its final decision with its Board of Trustees,
giving them the power to do so this
year, if in their judgment it was deemed
wise. The board, at a meeting held July 6,
1904, unanimously decided in favor of issuing
a monthly journal to be called "The
Journal of the Medical Society of New Jersey,"
and the management and control of
the same was placed in the hands of the
Publication Committee, according to the
provisions of the constitution and by-laws of
the Society.

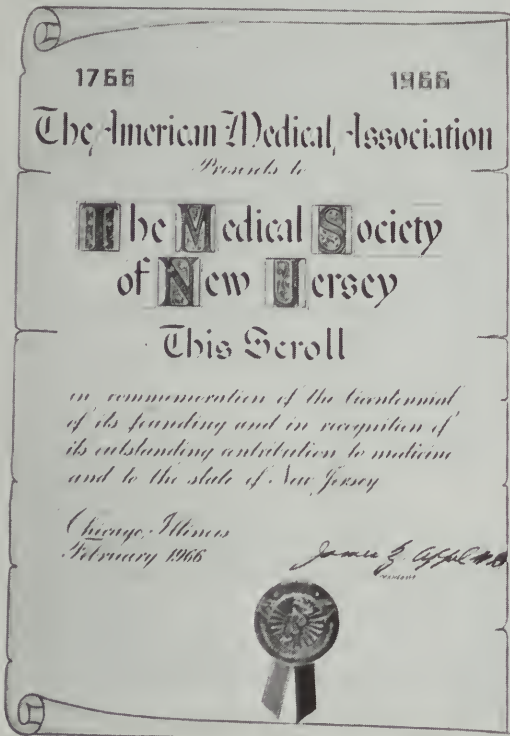

The committee, in accepting this great responsibility,
are pleased to inform and congratulate the members of the Society and the
profession at large, that the Board of Trustees

at the same meeting appointed Dr.
Richard C. Newton, of Montclair, editor of
the JOURNAL. The Publication Committee
bespeak for him the active co-operation of
the members of the State Society and especially
of its officers and committees and the
secretaries of our County Societies, as it
is his and our desire to make the JOURNAL
not merely a substitute for the annual volume
of transactions of the Society, but also an
up-to-date, bright, scientific medical journal,
that shall prove helpful to the members
of the profession in their practical work and
scientific advancement.

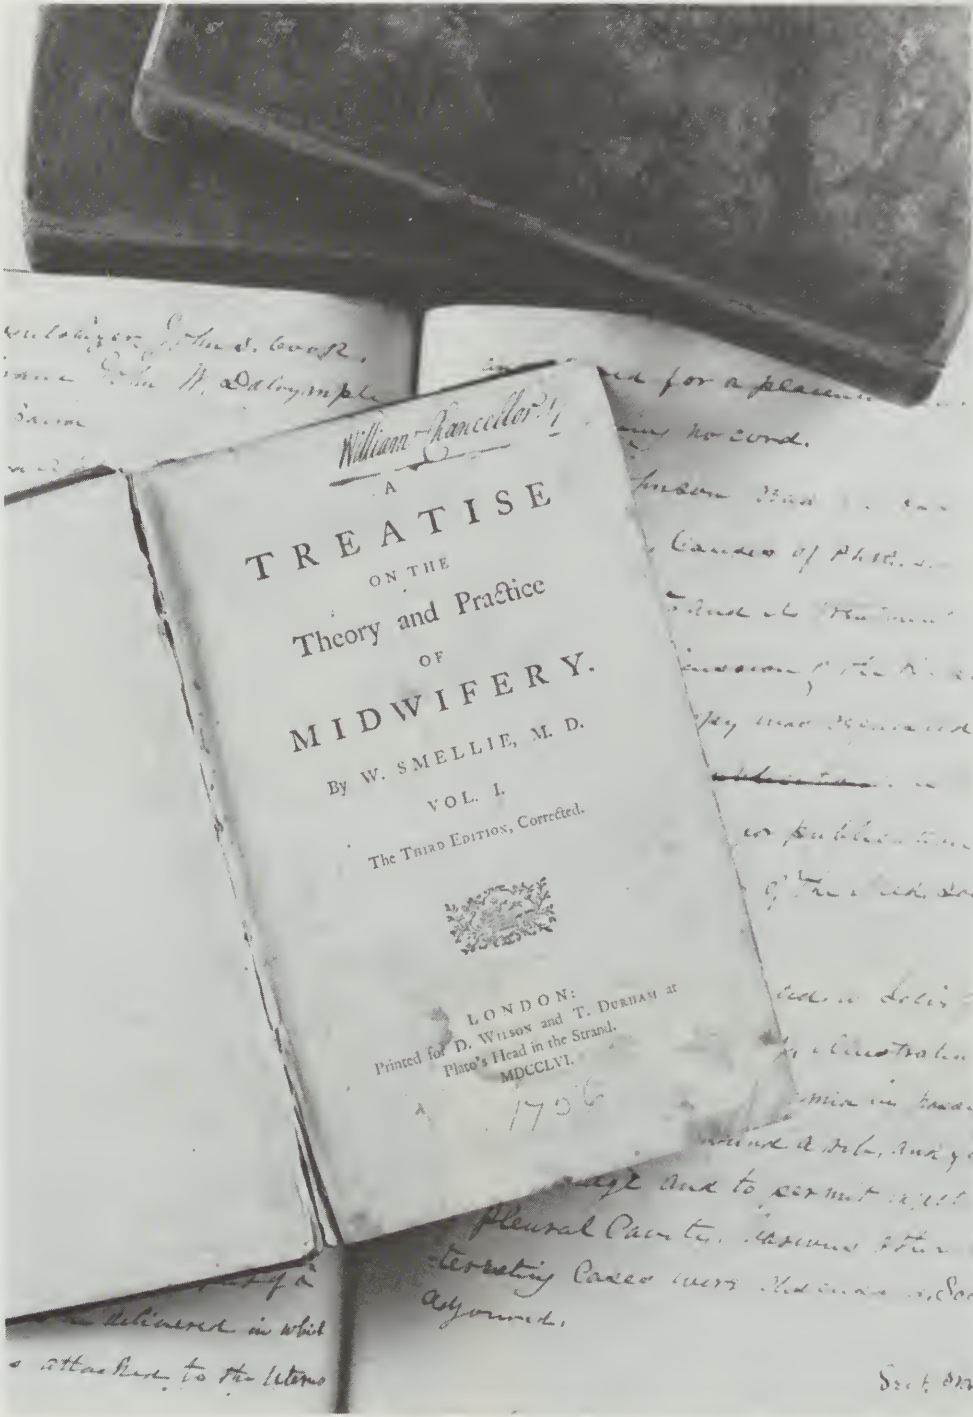

The committee also commends this JOURNAL
to the favorable consideration of advertisers.
Realizing that our readers compose
almost the entire body of regular practitioners
between the two great centres of medical

The Journal of the Medical Society of New Jersey was first published in September 1904 (top) under the direction of Editor David C. English, MD. In 1934, Frank Overton, MD (bottom right), became the editor; for the next seven and one-half years, Dr. Overton devoted himself to the journal and to creating a written history of the Medical Society of New Jersey. The photograph of Dr. Overton was taken in 1940 at the Society's Annual Meeting where he led a discussion on the value of membership in the state society. In 1941, Henry A. Davidson assumed the editorship of the state medical journal and was responsible for the cover artwork during the Society's bicentennial in 1965; the four-color cover featured the plaque from the American Medical Association honoring the 200th anniversary of the Medical Society of New Jersey (bottom left).

THE JOURNAL OF THE MEDICAL SOCIETY OF NEW JERSEY

Frank Overton, M. D.,
Editor.

The Medical Society of New Jersey owns over 40 rare medical books including the two books shown here: *A Treatise on the Theory and Practice of Midwifery* by William Smellie and *The Anatomy of the Human Body* by William Cheselden. Smellie's book, dated 1756, was owned by Dr. Lawrence Van Der Veer. Cheselden's volume was published in 1806 and was the second American edition.

Two of the oldest items in the Archives of the Medical Society of New Jersey are shown on this page. A druggist's bill (top) dated July 6, 1838, contains a listing of all prescribed drugs for the Suydam family; the total accounting for three years, 1835-1838, came to \$179.50. A physician's ledger (bottom) dated 1785 belonged to Robert R. Henry, M.D., for his patient John Wortman, Esquire. The ledger was kept from 1785 to 1794 and was for all family members; note that expenses were listed in pounds, shillings, and pence.

The Medical Society of New Jersey is the oldest medical society in the United States. In the 1800s, Atlantic City was the host town for the MSNJ Annual Meetings. At the 1892 meeting, beige ribbons were attached to physician name badges (top). For the 113th Annual Meeting, programs were printed listing names of officers and events for the two-day meeting (top). With succeeding years, the official programs grew bigger and bigger, detailing events for the Annual Meetings and disseminating information about the Society (bottom). Programs from 1904, 1946, 1954, and 1961 are outstanding examples of work published by the Society.

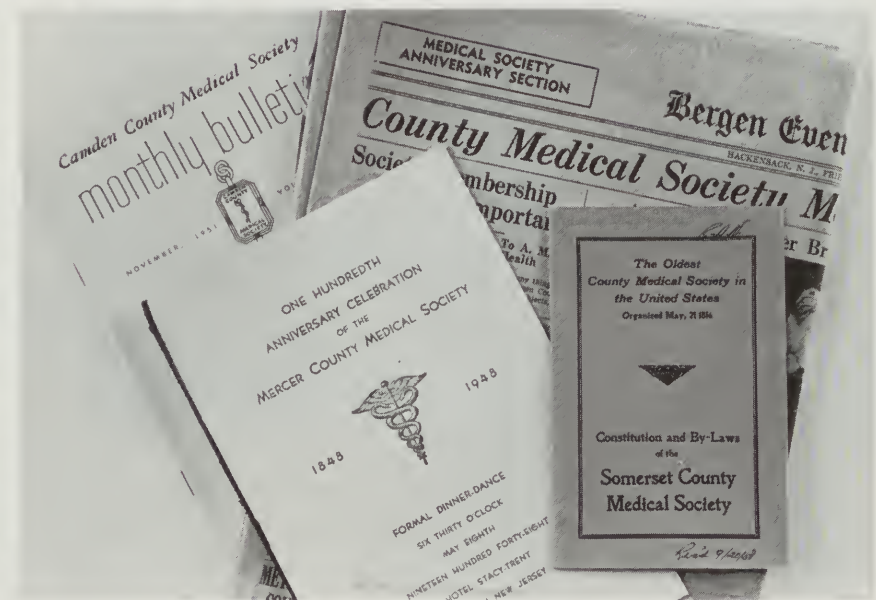

County medical societies have played a major role in the growth and development of the Medical Society of New Jersey. The Archives of the Medical Society houses the original minutes book for the formation of the Warren County Medical Society entitled, "Bylaws, Rules and Regulations of the district Medical Society for the county of Warren," dated 1826 (left).

In 1937, members of the Hunterdon County Medical Society (middle) were photographed to encourage others to join. And, county societies publish a variety of informational material (right) for members, including; "Constitution and By-Laws of the Somerset County Society," 1958; "One Hundredth Anniversary Celebration of the Mercer County Medical Society," 1948; "Camden County Monthly Bulletin," 1951; and, a special anniversary newspaper article on the Bergen County Medical Society.

William Carlos Williams, MD, was a New Jersey pediatrician and a world-renowned poet. In 1973, the Medical Society of New Jersey devoted a special issue of its journal to honor Dr. Williams. On this 100th anniversary of his birth, Editor Arthur Krosnick, MD, and Guest Editor Avrum Katcher, MD, amassed a selection of poetry, prose, and artwork and solicited new articles on the private and public life of Dr. Williams. A four-color commissioned portrait of Dr. Williams by New Jersey artist Judi Neimann (left) was the cover of the journal in September 1973. A original signature of Dr. Williams from a hospital medical record, dated 1910, appears below his picture.

John Bennett Morrison, MD (left), was secretary of the Medical Society of New Jersey from 1923 to 1937. This photograph of Dr. Morrison was taken in 1937 and is signed.

Underwritten by the Medical Society of New Jersey

Secretary of the Medical Society of New Jersey from 1923 to 1937 incl.

John B. Morrison.

During his tenure as secretary, Dr. Morrison wrote a public relations pamphlet for the society, "Membership in the Medical Society of New Jersey, Is It Worth the Price?" Published in 1930 (right), and distributed to all members, the address was read before the Hudson County Medical Society.

Woman's Auxiliary of the New Jersey Medical Society

The Auxiliary of the Medical Society of New Jersey was established in 1927 and its first president was Mrs. A. Haines Lippincott (left). The Auxiliary is proud of its publication, *The Shingle*, once called *New Jersey Newsletter*. A collection envelope from 1936 (bottom) created by the Essex County Medical Society to raise funds stated, "16 pennies make a foot; 5280 feet make a mile. That will be \$844.80." And, members in the county who paid their dues, received a membership card (bottom). Membership rosters have become standard for the Auxiliary; on many of the back covers the following message is printed: "I pledge my loyalty and devotion to the Auxiliary of the Medical Society of New Jersey and to the American Medical Association. I will support their activities, protect their reputations, and ever sustain their high ideals."

To Uncle Jack from
 Julia Allison Probst

In 1890, the Englewood Hospital was established to serve the local community. The picture of the hospital as it was in 1905 is preserved on this postcard sent by Julia Allison Probst to her Uncle Jack Allison in Germany. Postmarked Bonn, the card needed one penny for domestic postage and two pennies for foreign postage.

OVER 3500 PATIENTS AND THEIR PHYSICIANS HAVE USED OUR LITHOTRIPTER SERVICE.

In a field where experience is often measured in days or months, the Mid-Atlantic Kidney Stone Center stands apart. With nearly three years of expertise as a lithotripsy service, we have treated more than 3500 kidney stone patients resulting in a high degree of confidence by referring physicians in New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware.

Our concern for the patient's well-being is central to our con-

cept of good patient care. Our professional staff prepares the patients for every aspect of treatment with warmth and understanding. We spend a great deal of time with patients to reassure them and explain the procedure. And patients appreciate the personalized care of the Mid-Atlantic Kidney Stone Center.

Our relationship with referring physicians ensures quality care by providing timely communica-

tions during your patient's treatment. In addition, we are available 24 hours a day for pre- and post-treatment consultation. We believe this cooperation between the referring urologist and the staff at Mid-Atlantic is essential to effective treatment and recovery. To find out more about our service, or to obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337 or (800) 53-LITHO.

***UMDNJ Notes; Physicians
Seeking Location in
New Jersey***

SOM target AIDS, cancer, heart disease, diabetes, disorders of aging, and other unsolved medical problems.

Funds for the building were provided by state legislation aimed at strengthening medical education in southern New Jersey and enhancing the region's health care and biomedical research environment.

At present, the 112 first- and second-year students at UMDNJ-SOM receive their basic science education at UMDNJ-Piscataway Campus along with students at UMDNJ-Robert Wood Johnson Medical School. For their third and fourth years, the SOM students go to southern New Jersey for their clinical course of study, which is divided between UMDNJ's Education and Research Building in Camden, and the clinical center in Stratford.

A new multidisciplinary team of specialists has been assembled at our Newark-based New Jersey Medical School to treat children born with cleft lips and palates. The team, which provides the service at a bimonthly clinic at University Hospital, combines the talents of plastic surgeons, dentists, genetic counselors, and speech therapists.

Under the direction of Dr. Paul LoVerme, a plastic surgeon and UMDNJ alumnus, the service sees patients as early as infancy, counseling parents before they leave the hospital with the newborn.

For the very young, appliances are used in the palate area to help realign the bone before surgery to achieve a better result. Dr. LoVerme said that when a cleft is present, there also is muscle deficiency that affects the basic acts of breathing, eating, talking, and smiling.

Surgical repair usually is done in two stages, first the lip and then the palate. Dental specialists can help realign teeth or supply a prosthesis, or artificial part, as a replacement for areas not brought together.

Speech therapists help teach speech patterns that can overcome physical limitations. Genetic counseling is important because one-third of those with the birth defect have a family history. In fact, Dr. LoVerme said, the numbers are increasing because the cosmetic and functional repairs are so good that more people with cleft lip and palate marry and have children.

A physician-scientist at our School of Osteopathic Medicine has shown a group of simple carbohydrates, called sulfated monosaccharides, to be powerful agents against AIDS virus. In a paper presented at the International AIDS conference in Stockholm, Dr. Omar Bagasra, associate professor of immunology and microbiology, reported that half of the 18 compounds tested in his laboratory completely inhibited the spread of HIV. Two of the most effective substances he tested were glucosamine disulfate and inositol hexasulfate, which are both single-compound sugars.

Dr. Bagasra noted that the compounds he tested are plentiful so those that eventually proved safe and effective in humans could be available for pennies per dose. Currently, treatment of AIDS with AZT can cost up to \$200 a week.

Free dental services for the elderly are being expanded by UMDNJ's Newark-based New Jersey Dental School. Supported by a grant from the New Jersey Department of Community Affairs, the School is initiating a geriatric internship program that will allow seven dental students to provide 200 hours of dental services to the elderly.

The students will travel to selected senior citizen complexes, nutritional centers, and nursing homes in northern New Jersey, as well as to three established centers which already provide geriatric dental care. Treatment sites have been identified in Essex County and the school's geriatric division is seeking centers elsewhere that also could benefit from this program.

The three existing locations for geriatric dental care are the Institute for Alzheimer's Disease and Related Disorders; the UMDNJ-Community Mental Health Center at Piscataway; the Essex County Geriatric Center; and the West Orange Municipal Dental Center. The dental school has offered services to these centers periodically in the past, but now will be able to do so on a more regular basis.

The students will present lectures on restorative and preventive dental techniques and perform oral examinations. Those senior citizens with the need for treatment will be referred to the school's Newark campus or one of the three existing satellite centers.

UMDNJ Notes

**Stanley S. Bergen, Jr., M.D.
President**

UMDNJ's School of Osteopathic Medicine (SOM) has begun phase two of a five-year plan to unify its three campuses, as ground was broken for a research and education building in Stratford.

The \$9.45 million three-story building is the second of four facilities which will comprise a new four-year campus for the osteopathic medical school. An ambulatory health care center, the school's clinical center, was completed last year. Academic and administration buildings are scheduled to finish the project in 1990.

The building will house laboratories, classrooms, and a vivarium, as well as facilities for electron microscopy, tissue and cell culture, and other research support areas. Ongoing research programs at UMDNJ-

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ALLERGY—Grant H. Greeley, M.D., 6305 Snow Heights Ct., El Paso, TX 79912. SUNY Downstate 1979. Also, internal medicine. Board certified. Also, board certified (IM). Partnership or multispecialty group within commuting distance of New York City. Available May 1989.

CARDIOLOGY—Donald G. Rubenstein, M.D., 1037 3rd St., #303, Santa Monica, CA 90403. Louisiana 1980. Board eligible. Group or partnership. Available.

DERMATOLOGY—Cheryl S. Citron, M.D., 885 Sussex Rd., San Marino, CA 91108. Miami 1984. Board eligible. Group, partnership, solo. Available.

FAMILY MEDICINE—John Travers, M.D., 14225 Kendra Way, Poway, CA 92064. UMDNJ 1982. Group or HMO. Available.

GASTROENTEROLOGY—Howard P. Fritz, M.D., 14 Baldwin Ct., Newington, CT 06111. St. Louis 1984. Also, internal medicine. Board eligible. Board certified (IM). Available July 1989.

INTERNAL MEDICINE—Howard P. Fritz, M.D., 14 Baldwin Ct., Newington, CT 06111. St. Louis 1984. Also, gastroenterology. Board certified. Available July 1989.

Grant H. Greeley, M.D., 6305 Snow Heights Ct., El Paso, TX 79912. SUNY Downstate 1979. Also, allergy. Board certified (ALLERGY). Partnership or multispecialty group within commuting distance of New York City. Available May 1989.

Lalitha B. Iyer, M.D., 84 Hempstead Dr., Somerset, NJ 08873. Madras (India) 1980. Board eligible. Group, partnership, emergency room. Available.

ORTHOPEDICS—Paul Bizzigotti, M.D., 230 E. 12 St., #7A, New York, NY 10003. NYU 1981. Board eligible. Group or partnership. Available.

Joseph M. Grant, M.D., Naval Hospital, Box 8, FPO San Francisco, CA. UMDNJ 1980. Board eligible. Group or partnership. Available July 1989.

PEDIATRICS—Linda York-Chance, M.D., 435 East 70th St., New York, NY 10021. Connecticut 1985. Board eligible. Clinic or emergency room. Available.

Iraj Modarai, M.D., 40 Cherry Hill, Springfield, VT 05156. Tabriz (Iran) 1956; Polyclinic 1963. Board certified. Clinic, emergency, salary. Available.

PHYSICAL MEDICINE AND REHABILITATION—Robert B. Thorne, M.D., 1219 East Northern Pkwy., Baltimore, MD 21239. Rutgers 1980. Board certified. Available.

RADIOLOGY—Joseph M. Ullman, M.D., 148 Chestnut Crossing Dr., Apt. 1, Newark, DE 19713. George Washington 1984. Board eligible. Group, partnership, community hospital, outpatient imaging center. Available July 1989.

SURGERY—Andrea Resciniti, M.D., 4 Duncannon Ave., Apt. 9, Worcester, MA 01604. Hahnemann 1983. Board eligible. HMO, multispecialty, group, single specialty group. Available.

UROLOGY—Joseph G. Colonna, M.D., 503 Captain Dement Dr., Waldorf, MD 20601. Guadalajara 1977. Board certified. Group, partnership, solo. Available.

MEDICAL SEMINAR SERIES - 1:00 - 4:00 P.M.

Sept. 7: AIDS and AIDS Related
 Infections
 Oct. 4: Osteoporosis

Oct. 19: Dept. of Medicine Resident
 Alumni Research Seminar
 Oct. 26: Anti-Coagulation Therapy &
 Disorders of Coagulation

Nov. 2: Treatment of Hypertension
 Nov. 30: Management of Hyperlipidemia
 Dec. 7: Valvular Heart Disease

WATCH FOR FUTURE ANNOUNCEMENTS!!

Presented by:
 William S. Frankl, M.D.
 Professor of Medicine
 Chairman, Dept. of Medicine

Allan B. Schwartz, M.D.
 Professor of Medicine, Deputy Chairman
 Graduate Medical Education

Classroom C (Alumni Hall), New College Bldg.
 15th & Vine Streets, Philadelphia, Pennsylvania

For further information: Office of Continuing Education, (215) 448-8263
 Approved for CME, AOA and AAFP credits.

The Comprehensive Headache Center
at The Germantown Hospital and Medical Center
in cooperation with Temple University School of Medicine, Department of Neurology
Presents

Fourth Annual— **A HEADACHE SYMPOSIUM** *New Advances in Headache Treatment*

Moderator: Stephen D. Silberstein, M.D.
Chief, Neurology Section & Co-Director,
The Comprehensive Headache Center,
The Germantown Hospital and Medical Center;
Associate Professor of Neurology, Temple University

Saturday, October 1, 1988 8:30 A.M.–3:15 P.M.
at The Germantown Hospital and Medical Center

One Penn Boulevard, Philadelphia, Pa.
(adjacent to LaSalle University at the intersection
of Wister, Chew and Olney Avenues)

Featured Speakers and Topics:

Welcoming Remarks

Edward Jones, M.D.
Chief, Nephrology Section &
Deputy Chairman, Department of Medicine,
The Germantown Hospital and Medical Center

Drug Induced Headaches

Ninan T. Mathew, M.D.
Clinical Associate Professor of Neurology,
University of Texas;
Director, Houston Headache Center

Sexual and AIDS-Related Headaches

Jerome Goldstein, M.D.
Associate Clinical Professor of Neurology,
University of California at San Francisco

A Unifying Concept of Migraine Mechanisms

K.M.A. Welch, M.D.
Professor & Chairman, Department of Neurology,
Henry Ford Hospital, Detroit, Michigan

Depression in the Headache Population

Gregory J. Tramuta, M.D.
Associate Clinical Professor of Psychiatry,
Temple University Hospital;
Chief of Psychiatry,
The Germantown Hospital and Medical Center

Additional participants will include:

Elliott A. Schulman, M.D., Attending Neurologist, The Germantown Hospital and Medical Center; Assistant Professor of Neurology, Temple University; Fellow of the American Academy of Neurology.

Ronald S. Kaiser, Ph.D., Licensed Clinical Psychologist; Affiliate, Psychiatry Section, The Germantown Hospital and Medical Center; Clinical Assistant Professor of Psychology, Hahnemann University; Adjunct Associate Professor of Psychology, Temple University.

Joseph P. Primavera, III, M.A., Licensed Clinical Psychologist; Affiliate, Psychiatry Section, The Germantown Hospital and Medical Center; Co-Director, The Biofeedback Laboratory.

A roundtable discussion will include controversial topics in headache management and difficult cases.

*Plan to bring your difficult cases for discussion.

5 Category I credits for
the AMA Physician's
Recognition Award and
5 Category I credits for the
American Psychologists
Association.

Registration Fee:

\$25.00 includes coffee breaks, lunch and
registration materials.

Please make checks payable to:
The Germantown Hospital and Medical Center
and send by September 19, 1988 to:

The Comprehensive Headache Center
The Germantown Hospital and Medical Center
One Penn Boulevard, Philadelphia, PA 19144

**COMPREHENSIVE
HEADACHE CENTER**

The following is a list of continuing medical education courses for the next two months. Contact the sponsoring organization for further information.

This list is compiled through the cooperation of the Committee on Medical Education of the Medical Society of New Jersey, the Academy of Medicine of New Jersey, the New Jersey Chapter of the American Academy of Family Physicians, and the UMDNJ Office of Continuing Medical Education. For information on accreditation, please contact the sponsoring organization(s), indicated by italics—last line of each item.

ALLERGY

October

- 5 Food Allergy**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic
(AMNJ)

November

- 6- In Vitro Allergy Seminar: Update 1988**
Various times—Trump Plaza Hotel and Casino, Atlantic City
(Holy Name Hospital)
- 11 Asthma and Allergies**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton
(Bridgeton Hospital)

ANESTHESIOLOGY

November

- 2 Pain Therapy**
10:30-11:30 A.M.—Christ Hospital, Jersey City
(AMNJ)
- 15 Anesthesia and the Burn Patient**
6-9 P.M.—Ramada Inn, Clark
(NJ State Society of Anesthesiologists)
- 15 NJSSA—General Membership Meeting**
6-10 P.M.—Ramada Inn, Clark
(NJSSA)

CARDIOLOGY

October

- 5 Advanced Cardiac Life Support**
6 P.M.—Freehold Area Hospital, Freehold
(Freehold Area Hospital)
- 11 Cholesterol Reduction and Cardiovascular Issues**
10:30-11:30 A.M.—West Hudson Hospital, Kearny
(West Hudson Hospital)
- 11 Indications for Invasive Studies**
12 noon-1 P.M.—Hospital Center at Orange
(AMNJ)
- 18 Thrombolytic Therapy in the 1980s**
7:30-8:30 P.M.—Mercer Medical Center, Trenton
(Mercer Medical Center)
- 26 The Prevention of Sudden Cardiac Death**
8:15 A.M.-6 P.M.—Vista Hotel, Elizabeth
(UMDNJ)

November

- 7 Advanced Cardiac Life Support**
6 P.M.—Freehold Area Hospital, Freehold
(Freehold Area Hospital)
- 15 Thromboembolism and Thrombolytic Therapy**
12 noon-1 P.M.—Hospital Center at Orange
(AMNJ)
- 17 Indications for Noninvasive Studies**
2:30-3:30 P.M.—Ancora Psychiatric Hospital, Hammonton
(AMNJ)

DERMATOLOGY

October

- 4 Diagnosis and Management of Cutaneous Disorders of the Newborn**
8:30-9:30 A.M.—Newark Beth Israel Medical Center, Newark
(Newark Beth Israel Medical Center)
- 6 Common Dermatoses**
11 A.M.-12 noon—St. Joseph's Hospital and Medical Center, Paterson
(AMNJ)
- 11 Dermatological Society of New Jersey**
7-10 P.M.—Schering-Plough Corporation, Kenilworth
(Dermatological Society of New Jersey)
- 19 Dermatology Conferences**
6-9 P.M.—Rutgers Community Health Plan, 57 U.S. Highway 1, New Brunswick
(UMDNJ)
- 19 Insights into Clinical and Investigative Pediatric Dermatology**
12 noon-6:30 P.M.—Robert Wood Johnson Medical School, Medical Education Building, New Brunswick
(UMDNJ)
- 26 Dermatology 1988**

8 A.M.-4:30 P.M.—Medical Center of Learning Auditorium, Englewood Hospital, Englewood
(Englewood Hospital)

November

- 8 Dermatological Society of New Jersey**
7-10 P.M.—Schering-Plough Corporation, Kenilworth
(Dermatological Society of New Jersey)
- 15 Update of Superficial Fungal Infections**
2-3 P.M.—Hunterdon Developmental Center, Clinton
(AMNJ)
- 16 Dermatology Conferences**
6-9 P.M.—Rutgers Community Health Plan, 57 U.S. Highway 1, New Brunswick
(UMDNJ)

MEDICINE

October

- 4 Hirsutism**
7-8 P.M.—West Hudson Hospital, Kearny
(West Hudson Hospital)
- 4 Ethical Challenges in Developmental Medicine**
10-11 A.M.—Green Brook Regional Center, Green Brook
(AMNJ)
- 5 Common ENT Problems**
1:30-2:30 P.M.—HMO, New Brunswick
(Rutgers Community Health Plan)
- 5 AIDS: Diagnosis and Treatment**
1:30 P.M.-2:30 P.M.—Essex County Hospital Center, Cedar Grove
(AMNJ)
- 5 What Can the Primary Care Physician Do About Obesity?**
9-10:30 A.M.—Somerset Medical Center, Somerville
(Somerset Medical Center)
- 5 Care for the Dying Patient**
1:30-2:30 P.M.—RCHP, 57 U.S. Highway 1, New Brunswick
(Rutgers Community Health Plan)
- 5 Intensive Review of Medicine**
8:30-10 A.M.—Alexian Brothers Hospital, Elizabeth
(Cornell University Medical College and the National Institutes of Health)
- 5 Sports Medicine 1988**
9 A.M.-1:15 P.M.—Medical Society of New Jersey headquarters, Lawrenceville
(MSNJ)
- 5 Medical Lecture Series**
10:30-11:30 A.M.—Christ Hospital, Jersey City
(Christ Hospital)
- 8 Medical History Society of New Jersey**
10 A.M.-2 P.M.—UMDNJ, Newark
(Medical History Society of NJ)
- 11 Running the Health Care Practice Like a Business**
8-10 A.M.—The Union Hotel, Flemington
(Zdenek, Horvath and Scebelo)
- 11 Medical Grand Rounds**

THE PHILADELPHIA HEART INSTITUTE
of Presbyterian-University of Pennsylvania Medical Center

**A GENERAL SURGERY
REVIEW COURSE**

Friday, September 30 &
Saturday, October 1, 1988

7:45 A.M.-4:30 P.M.

at
**The Hilton at Short Hills
Short Hills, New Jersey**

This course is designed to give the participant an extensive review of the topics in general surgery and the surgical specialties that are likely to be covered on the American Board of Surgery Recertification Examination as well as the Qualifying (written) Examination of the Board.

It also will be of value to the practicing surgeon not studying for either of the examinations who desires an update on general surgery, or for the resident surgeon presently in a training program.

The course is designed to cover the topics from the viewpoint of clinical management and decision making, with basic science considerations added as they enhance the clinical perspective.

The distribution of time allotted to each particular topic will parallel the emphasis given to that topic by the Board in previous examinations.

PROGRAM DIRECTOR: GEORGE W. MACHIEDO, M.D.

Professor and Vice Chairman
Director of Clinical Surgery
UMDNJ University Hospital
Newark, New Jersey

Allergy, Principles and Practice; Color Doppler in Clinical Cardiology; Management of Common Problems in Obstetrics and Gynecology

Allergy, Principles and Practice. Vol. I and II. Third Edition

Elliot Middleton, Jr., M.D., Charles E. Reed, M.D., Elliot F. Ellis, M.D., et al., (eds). St. Louis, MO, C.V. Mosby Company, 1988.

This is a wonderfully updated text for those interested in allergy and immunology from basics to detailed clinical problems. The book is divided into two volumes: the first volume deals with basic sciences and the second volume deals with the clinical significance of various allergic and immunologic disorders including asthma.

The updating of this text has been performed meritoriously under the editorship of Elliot Middleton, with appropriate updates of all chapters as compared to the previous edition. The text is well written with current references and excellent tables, figures, and photographs.

I highly recommend this book to all practicing allergists and immunologists as well as those who have any interest in the basic sciences, or direct patient care, or for general expansion of knowledge in this area.

Leonard Bielory, M.D.

Color Doppler in Clinical Cardiology

Walter J. Duncan, M.D. Philadelphia, PA, W.B. Saunders Company, 1988. Pp. 163. (\$95)

This is a short and very well-illustrated text describing the new technology of color flow doppler imaging, a technique which combines noninvasive flow imaging with standard two-dimensional intracardiac imaging. The first of its five chapters is oriented to the reader who has only a basic knowledge of physics. Included in the first chapter of the text is a review of techniques to assess pulmonary flow and intracardiac shunts.

The chapter entitled, "Examination of the Color Doppler Technique," attempts to familiarize the reader with the author's combined two-dimensional and color doppler examination. A basic knowledge of two-dimensional echocardiography is necessary.

With its wide range of case studies, the book takes the form of a text atlas. The first set of case studies is devoted to pediatric abnormalities and the second set of case studies is devoted to adult diseases. The book ends with a short presentation of case studies of intraoperative imaging.

The text is clear and concise and the photographs are of excellent quality. The book is highly recommended for the physician who has a working knowledge of two-dimensional echocardiography and wishes to utilize this technique in his ultrasonographic examination.

Neil B. Horner, M.D.

Management of Common Problems in Obstetrics and Gynecology

Daniel R. Mitchell, Jr., M.D., Paul F. Brenner, M.D., (eds). Oradell, NJ, Medical Economics Books, 1988.

It is an awesome responsibility to review a textbook edited by authorities bearing titles of full professor, chairman, and vice-president. It is almost presumptuous to critique a second edition of a compendium that covers practically every common problem in our discipline, and that is recommended by a dean and vice-chancellor for almost everybody. There are errors of commission and

omission in *Management of Common Problems in Obstetrics and Gynecology* which cannot be ignored.

False negative cytology has received much publicity this year. There is no excuse for the authors to adhere to an outmoded nomenclature that is the hallmark of the "Pap mills" that probably are responsible for most of the false negatives, notwithstanding "laboratory error accounts for a small number of cytology misses." This statement appears almost insignificant compared to thousands of accurate statements but nothing has discredited this most rapid, cost-effective method of cervical cancer screening than the false-negative scandal.

Frequent radiologic reports of mammary dysplasia are vexatious for the clinician while the academician is touting estrogens for nearly every postmenopausal woman without cancer. Mammary dysplasia deserves authoritative advice.

Most research into oral contraceptives reports triglyceride elevations after one year. The authors not only fail to mention this, but advise uninterrupted use for years.

Three simple office procedures should precede expensive, time-consuming workups: (1) a postcoital test for infertility; (2) catheterization for residual urine in cases of stress incontinence; (3) a three-month trial of oral contraceptives for suspected endometriosis unless contraindications exist.

Despite the dean's blessing, this edition cannot be recommended wholeheartedly to students because many of the authors presume so much background experience and education that many of their contributions are not entirely meaningful and intelligible. If a third edition is prepared, hopefully the editors will read every word contributed by their experts as well as the galley proofs, keeping the student and the older practitioner in mind. Slang may be effective in the lecture hall, but rarely in print.

This book is recommended especially for the resident overconfident after a year of manual training, and preparing to meet examiners resistant to contradiction.

Jerome Abrams, M.D., M.P.H.

DOCTORS' BILL

The "collateral source" bill passed by the New Jersey Legislature and signed into law by Governor Kean is a significant victory in the Exchange's efforts to reform the medical malpractice legal system. The Exchange provided the leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. Elimination of some costly inequities in our tort system will help moderate the ever-increasing severity of insurance losses.

Drs. Abey; Dierwechter; Fidler; Filipczak; Hallock; Kearney; Knapp; Latona; Lobban; Murphy; Neville; Pindar; Ricciardelli; Stier; Strom; Trilling

Dr. William J. H. Abey

Pennington family practitioner William J. H. Abey, M.D., died on April 26, 1988, at the age of 87. Born in Manitoba, Canada, Dr. Abey was graduated from McGill University Faculty of Medicine, Montreal, in 1926. He resided in Pennington for 50 years, where he maintained his practice, before moving to Florida 12 years ago. Dr. Abey was a veteran of the Royal Canadian Air Force. In 1976, Dr. Abey received the Medical Society of New Jersey's Golden Merit Award for 50 years of service to his medical community.

Dr. R. James Dierwechter

Brigantine family physician R. James Dierwechter, M.D., died on April 29, 1988, at the age of 76. Born in Philadelphia, Dr. Dierwechter received his medical degree from Hahnemann Medical College and Hospital, Pennsylvania, in 1940. A fellow of the American Academy of Family Practice, Dr. Dierwechter was a member of our Atlantic County component and of the American Medical Association. A Brigantine area resident and physician for over

40 years, Dr. Dierwechter became affiliated with Atlantic City Medical Center, and became public school physician for Brigantine. During World War II, he served in the United States Army medical corps as a physician, emerging with the rank of lieutenant colonel.

Dr. Harry E. Fidler

Retired otolaryngologist Harry Earl Fidler, M.D., died on April 27, 1988, at the age of 68. Born in Hooversville, Pennsylvania, Dr. Fidler received his medical degree from Jefferson Medical College of Philadelphia, in 1946. A diplomate in otolaryngology, Dr. Fidler was affiliated with St. Peter's Medical Center, New Brunswick, and was a member of our Middlesex County component and of the AMA. During World War II, he was a captain in the United States Army.

Dr. Borys A. Filipczak

General surgeon Borys Anthony Filipczak, M.D., died on May 16, 1988, at the age of 80. A native of Sambir, in the Ukraine, Dr. Filipczak received his medical degree from the University of Cracow, Poland, in 1931. He emigrated to the United States in 1949, and from 1950 to 1955, maintained a practice in Toledo, Ohio. In 1955, Dr. Filipczak moved to Passaic, where he set up a private practice, and became affiliated with three Passaic hospitals: St. Mary's Hospital, Beth Israel Hospital, and the General Hospital Center. A fellow of the International College of Surgeons, Dr. Filipczak was a member of our Passaic County component and of the American Medical Association.

Dr. Wilton J. Hallock

Obstetrician-gynecologist Wilton Johnson Hallock, M.D., died on May 18, 1988, at the age of 89. A native of Jersey City, Dr. Hallock received his medical degree from New York Medical College in 1924. A fellow of the New Jersey Obstetric and Gynecological Society, Dr. Hallock was a member of our Union County component and of the AMA, as well as a staff member of Overlook Hospital, Summit. He is a veteran of the United States Army. In 1974, Dr. Hallock received the Medical Society of New Jersey's Golden Merit Award for 50 years as a physician.

Dr. John F. Kearney

Retired family practitioner John Francis Kearney, M.D., died on April 22, 1988, at the age of 82. Born in Scranton, Pennsylvania, Dr. Kearney received his medical degree at Columbia University College of Physicians and Surgeons, New York, in 1932. He maintained a private practice in Maplewood and was affiliated with St. Michael's Medical Center, Newark, before retiring. He was a lieutenant colonel in the United States Army during World War II, serving as a regimental surgeon for the 335th Engineer's Regiment in the European theatre. Dr. Kearney received MSNJ's Golden Merit Award in 1982.

Dr. Victor Knapp

Asbury Park family physician Victor Knapp, M.D., 88, died on April 22, 1988. A native of New York, Dr. Knapp received his medical degree from New York University School of Medicine, in 1921. He moved to Asbury Park in 1931, and maintained a private practice there for 57 years. Dr. Knapp became affiliated with Monmouth Memorial Hospital, Long Branch, and broadcast a weekly radio show, "Medical Topics," for over 20 years. He was a member of our Monmouth County component and of the AMA. Dr. Knapp was a recipient of MSNJ's Golden Merit Award in 1971.

Dr. Joseph A. Latona

General surgeon Joseph A. Latona, M.D., died on May 25, 1988, at the age of 84. Born in Palermo, Sicily, Dr. Latona received his medical degree at Cornell University Medical College, New York, in 1928. Affiliated with St. Mary's Hospital, Passaic, for 55 years, serving as both trustee and chief of tumor services, Dr. Latona maintained a medical practice in Lodi for 60 years. A fellow of the American College of Surgeons, Dr. Latona was a member of our Bergen County component and of the AMA. He was a 1978 recipient of the Golden Merit Award.

Dr. Robert B. Lobban

Robert B. Lobban, M.D., retired from surgery practice since 1972, died on May 26, 1988, at the age of 84. Born in Alderson, West Virginia, Dr. Lobban received his medical

degree from the University of Virginia Medical School in 1929. A diplomate in surgery and a fellow of the American College of Surgeons, Dr. Lobban was a member of our Hudson County component and of the AMA. Affiliated with Christ Hospital, Jersey City, he served as chief of surgery. Dr. Lobban also had maintained a private surgical practice since 1945. During World War II, Dr. Lobban was a colonel in the United States Army medical corps stationed in the South Pacific Islands. In 1979, he received MSNJ's Golden Merit Award.

Dr. Joseph P. Murphy

Family physician and specialist in internal medicine Joseph Paul Murphy, M.D., died on March 2, 1988, at the age of 64. Born in Newark, Dr. Murphy received his medical degree from the University of Amsterdam, the Netherlands, in 1958. He became affiliated with Warren Hospital, Phillipsburg, and was a member of our Warren County component and of the AMA. During World War II, he served in the United States Navy medical corps.

Dr. Robert J. Neville

Retired orthopedic surgeon Robert Jerome Neville, M.D., died on May 12, 1988, at the age of 78. A Brooklyn, New York, native, Dr. Neville received his medical degree from the Long Island College of Medicine, New York (now the Medical College of the State University of New York), in 1934. A diplomate in orthopedic surgery, Dr. Neville was a fellow of the American and International Colleges of Surgeons, and was a member of our Bergen County component and of the AMA. In addition to his Hackensack private practice, Dr. Neville was affiliated with Hackensack Medical Center, serving in many capacities: as director of the departments of orthopedic and traumatic surgery, and rehabilitative medicine; as chairman

of the medical executive board; and as the first director of the emergency department. Dr. Neville was orthopedic director for the National Foundation for Infantile Paralysis during the polio outbreak in the late 1940s. During the Korean War, he was a lieutenant colonel in the United States Army. Dr. Neville served as president of the New Jersey Orthopedic Society, and of the Bergen County Medical Society. In 1984, he received the Golden Merit Award.

Dr. Irene D. Pindar

General practitioner Irene Donnelly Pindar, M.D., died on April 19, 1988, at the age of 85. Born in Dayton, Ohio, Dr. Pindar received her medical degree from the University of Cincinnati, Ohio, in 1926. She operated a private practice in Teaneck for 50 years, and was affiliated with Holy Name Hospital, Teaneck, and Englewood Hospital. For 50 years as a physician, Dr. Pindar received MSNJ's Golden Merit Award in 1976.

Dr. E. F. Ricciardelli

Retired family practitioner Emmanuel Frederick Ricciardelli, Sr., M.D., died on June 1, 1988, at the age of 85. A lifelong resident of Jersey City, Dr. Ricciardelli received his medical degree from Temple University School of Medicine, Philadelphia, Pennsylvania, and opened a Jersey City private practice which he maintained for over 50 years. During World War II, Dr. Ricciardelli served as a captain in the United States Army medical corps. He was a member of our Hudson County component and of the AMA.

Dr. Howard W. Stier

General surgeon and practitioner Howard William Stier, M.D., 69, died on May 31, 1988, after 42 years of practice in Passaic. Born in Clifton, Dr. Stier received his medical degree from the University of Maryland School of Medicine, Baltimore, in

1943. A lifelong Passaic-Clifton area resident, Dr. Stier opened a private practice in 1945, and began an affiliation with the General Hospital Center at Passaic the same year. While a staff member of the hospital, Dr. Stier was chairman of the executive committee, president of the medical and dental staff, director of surgery, director of the emergency room, and was a member of the Passaic General Foundation Board. In 1958, he was honored by being named "staff member of the year." Dr. Stier was a member of our Passaic County component.

Dr. Abraham Strom

Internal medicine specialist Abraham Strom, M.D., died on December 25, 1987, at the age of 99. A native of Russia, Dr. Strom received his medical degree from the University of Berne, Switzerland. He was affiliated with Muhlenberg Medical Center, Plainfield, and maintained a private practice there for over 50 years. Dr. Strom was a member of our Union County component and of the AMA. In 1967, he received MSNJ's Golden Merit Award.

Dr. Leonard J. Trilling

Retired dermatologist Leonard Jay Trilling, M.D., died on May 31, 1988, at the age of 80. A native of Paterson, Dr. Trilling received his medical degree at Columbia University College of Physicians and Surgeons, New York, in 1934. He maintained two dermatology practices, one in Paterson from 1945 to 1955, and another in New York City. Dr. Trilling was affiliated with St. Joseph Hospital and Medical Center, Paterson, where he served as head of the Dermatology Department before his retirement in 1965. At that time, Dr. Trilling moved to Washington, D.C., where he was employed by the United States Food and Drug Administration. He was a member of our Passaic County component and of the AMA.

AUTHOR INFORMATION

NEW JERSEY MEDICINE is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in NEW JERSEY MEDICINE is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.
2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

MEDICAL DIRECTOR

Pennsylvania Blue Shield, the newly designated Medicare Part B carrier for the State of New Jersey, will be opening an office in the Trenton area and is seeking a full-time Medical Director. Requirements for this position include Board Certification and five years of clinical experience.

As a member of our Executive Staff, your responsibilities will include:

- Participation in the development and implementation of medical policy
- Interaction with health care providers and provider organizations
- Development of a state-wide professional consultant network
- Liaison with providers, regulators and customers

If you can demonstrate achievements in a business-oriented environment, we will provide a career challenge with a lucrative total compensation package. Send your curriculum vitae, including salary expectations to: Thomas C. Sommers, Vice President, Human Resources Administration, Pennsylvania Blue Shield, 1800 Center Street, Camp Hill, PA 17011. Equal Opportunity Employer M/F.

STAFF PSYCHIATRIST

Tired of breathing polluted air? Irritated at having to pay private school tuition in addition to taxes for your children's education? Weary of spending two hours a day commuting? Unhappy having to triple lock your doors and still be concerned for your family's safety? Then strongly consider moving to Knoxville, Iowa. Contemporary hospital based psychiatry with friendly colleagues who keep up with their medical fields. All the advantages of working for VAMC with paid vacation, sick leave, reasonable workload, appreciative patients and staff. Day Care Center on station available to VAMC working parents. (You may have lunch with your child.) Iowa Public High School students consistently score higher than other 49 states on S.A.T.'s. All cultural opportunities available in Chicago or Minneapolis (4-5 hours by car). Knoxville is a friendly, up-to-date town with contemporary stores. Des Moines (state capital) is less than one hour away by car. If you think this is too good to be true, call Dr. Lynn Huebler, 515-842-3101, Ext. 6003, and arrange to visit for an interview.

Equal Opportunity Employer.

YOCON®

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Adjunctive

LIBRAX®

THE PEACEMAKER.

Antianxiety
Antisecretory
Antispasmodic

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows: "Possibly" effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis. Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur.

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such

as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. After extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

We're Proud To Salute the Nation's #1 Money Manager

Integrated Resources Asset Management

According to CDA Investment Technologies, Inc.*, Integrated Resources Asset Management (IRAM) was named the top-ranked money manager for the three year period ending December 1987.

All of us at Integrated Resources Equity Corporation would like to congratulate the IRAM team on a job well done. As the investment advisor for numerous institutional investors and individuals with port-

folios in excess of \$100,000, IRAM has built a reputation for being one of the country's most dependable and accessible money managers.

If, like so many other substantial investors, you're interested in having your portfolio professionally managed, stop by your local Integrated Resources Equity Corp. office and find out how you can put the nation's top-ranked money manager to work for you.

*Top-ranked U.S. money manager for the three year period ending December 1987 was Integrated Resources Asset Management Corp., based upon filings with the SEC. Filing data was analyzed by CDA Investment Technologies, Inc.

THE LOWER RESPIRATORY TRACT— More vulnerable to infection in smokers and older adults

Experience counts

Cecilor[®] Pulvules[®]
250 mg
cefaclor
think of it first

For respiratory tract infections due to susceptible strains of indicated organisms.

Summary.
Consult the package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A β -hemolytic streptococci).

Contraindication: Known allergy to cephalosporins.

Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Cecilor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Cecilor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in

moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.

- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.

- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Cecilor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] and toxic epidermal necrolysis or the above skin manifestations accompanied by arthritis/arthralgia, and frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Cecilor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.

- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%, and rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology

- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis: elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistest[®] tablets but not with Tes-Tape[®] (glucose enzymatic test strip, Lilly).

☐ SUBSTITUTION PERMISSIBLE

☒ DO NOT SUBSTITUTE

THEO-DUR[®]
(theophylline anhydrous) Sustained
Action Tablets

There's no substitute
for success.

See following page for brief summary of prescribing information.

THEO-DUR®

THEOPHYLLINE (Anhydrous) Sustained Action Tablets

INDICATIONS: THEO-DUR is indicated for relief and/or prevention of symptoms of asthma and for reversible bronchospasm associated with chronic bronchitis and emphysema.

CONTRAINDICATIONS: THEO-DUR is contraindicated in individuals who have shown hypersensitivity to theophylline or any of the tablet components.

WARNINGS: Status asthmaticus should be considered a medical emergency and is defined as that degree of bronchospasm which is not rapidly responsive to usual doses of conventional bronchodilators. Optimal therapy for such patients frequently requires both additional medication, parenterally administered, and close monitoring, preferably in an intensive care setting.

Although increasing the dose of theophylline may bring about relief, such treatment may be associated with toxicity. The likelihood of such toxicity developing increases significantly when the serum theophylline concentration exceeds 20 mcg/ml. Therefore, determination of serum theophylline levels is recommended to assure maximal benefit without excessive risk.

Serum levels above 20 mcg/ml are rarely found after appropriate administration of recommended doses. However, in individuals in whom theophylline plasma clearance is reduced for any reason, even conventional doses may result in increased serum levels and potential toxicity. Reduced theophylline clearance has been documented in the following readily identifiable groups: 1) patients with impaired renal or liver function; 2) patients over 55 years of age, particularly males and those with chronic lung disease; 3) those with cardiac failure from any cause; 4) neonates; and 5) those patients taking certain drugs (macrolide antibiotics and cimetidine). Decreased clearance of theophylline may be associated with either influenza immunization or active infection with influenza.

Reduction of dosage and laboratory monitoring is especially appropriate in the above individuals. Less serious signs of theophylline toxicity (i.e. nausea and restlessness) may occur frequently when initiating therapy, but are usually transient; when such signs are persistent during maintenance therapy, they are often associated with serum concentrations above 20 mcg/ml. Unfortunately, however, serious side effects such as ventricular arrhythmias, convulsions or even death may appear as the first sign of toxicity without any previous warning. Stated differently: serious toxicity is not reliably preceded by less severe side effects.

Many patients who require theophylline may exhibit tachycardia due to their underlying disease process so that the cause/effect relationship to elevated serum theophylline concentrations may not be appreciated.

Theophylline products may cause dysrhythmia and/or worsen pre-existing arrhythmias and any significant change in rate and/or rhythm warrants monitoring and further investigation.

The occurrence of arrhythmias and sudden death (with histological evidence of necrosis of the myocardium) has been recorded in laboratory animals (minipigs, rodents and dogs) when theophylline and beta agonists were administered concomitantly, although not when either was administered alone. The significance of these findings when applied to human usage is currently unknown.

PRECAUTIONS: THEO-DUR TABLETS SHOULD NOT BE CHEWED OR CRUSHED.

General: Theophylline half-life is shorter in smokers than in non-smokers. Therefore, smokers may require larger or more frequent doses. Morphine and curare should be used with caution in patients with airway obstruction as they may suppress respiration and stimulate histamine release. Alternative drugs should be used when possible. Theophylline should not be administered concurrently with other xanthine medications. Use with caution in patients with severe cardiac disease, severe hypoxemia, hypertension, hyperthyroidism, acute myocardial injury, cor pulmonale, congestive heart failure, liver disease, in the elderly (especially males) and in neonates. In particular, great caution should be used in giving theophylline to patients with congestive heart failure. Frequently, such patients have markedly prolonged theophylline serum levels with theophylline persisting in serum for long periods following discontinuation of the drug. Individuals who are rapid metabolizers of theophylline, such as the young, smokers, and some non-smoking adults, may not be suitable candidates for once-daily dosing. These individuals will generally need to be dosed at 12 hour or sometimes 8 hour intervals. Such patients may exhibit symptoms of bronchospasm near the end of a dosing interval, or may have wider peak-to-trough differences than desired.

Use theophylline cautiously in patients with history of peptic ulcer. Theophylline may occasionally act as a local irritant to the G.I. tract although gastrointestinal symptoms are more commonly centrally mediated and associated with serum drug concentrations over 20 mcg/ml.

Information for Patients: The physician should reinforce the importance of taking only the prescribed dose and time interval between doses. THEO-DUR tablets should not be chewed or crushed. When dosing THEO-DUR on a once daily (24 hr) basis, tablets should be taken whole and not split. As with any controlled-release theophylline product, the patient should alert the physician if symptoms occur repeatedly, especially near the end of the dosing interval.

DRUG INTERACTIONS: Drug-Drug: Toxic synergism with epinephrine has been documented and may occur with some other sympathomimetic bronchodilators. In addition, the following drug interactions have been demonstrated:

Drug	Effect
Theophylline with lithium carbonate	Increased excretion of lithium carbonate
Theophylline with propranolol	Antagonism of propranolol effect
Theophylline with cimetidine	Increased theophylline blood levels
Theophylline with troleandomycin, erythromycin	Increased theophylline blood levels

Drug-Food: THEO-DUR 100 mg Sustained Action Tablets have not been adequately studied to determine whether their bioavailability is altered when given with food. Available data suggest that drug administration at the time of food ingestion may influence the absorption characteristics of theophylline controlled-release products resulting in serum values different from those found after administration in the fasting state.

A drug-food effect, if any, would likely have its greatest clinical significance when high theophylline serum levels are being maintained and/or when large single doses (greater than 13 mg/kg or 900 mg) of a controlled-release theophylline product are given.

THEO-DUR (200, 300, and 450 mg) Sustained Action Tablets: The rate and extent of absorption of theophylline from THEO-DUR 200 mg, 300 mg, and 450 mg tablets when administered fasting or immediately after a moderately high fat content breakfast is similar.

Drug-Laboratory Test Interactions: When plasma levels of theophylline are measured by spectrophotometric methods, coffee, tea, cola beverages, chocolate, and acetaminophen contribute falsely high values.

Carcinogenesis, Mutagenesis, and Impairment of Fertility: Long-term animal studies have not been performed to evaluate the carcinogenic potential, mutagenic potential, or the effect on fertility of xanthine compounds.

Pregnancy: Category C—Animal reproduction studies have not been conducted with theophylline. It is not known whether theophylline can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Xanthines should be given to a pregnant woman only if clearly needed.

Nursing Mothers: It has been reported that theophylline distributes readily into breast milk and may cause adverse effects in the infant. Caution must be used if prescribing xanthine to a mother who is nursing, taking into account the risk/benefit of this therapy.

Pediatric Use: Safety and effectiveness of THEO-DUR administered:

1. Every 24 hours in children under 12 years of age, have not been established.
2. Every 12 hours in children under 6 years of age, have not been established.

ADVERSE REACTIONS: The most consistent adverse reactions are usually due to overdose and are:

1. **Gastrointestinal:** nausea, vomiting, epigastric pain, hematemesis, diarrhea.
2. **Central nervous system:** headaches, irritability, restlessness, insomnia, reflex hyperexcitability, muscle twitching, clonic and tonic generalized convulsions.
3. **Cardiovascular:** palpitation, tachycardia, extrasystoles, flushing, hypotension, circulatory failure, ventricular arrhythmias.
4. **Respiratory:** tachypnea.
5. **Renal:** albuminuria, increased excretion of renal tubular and red blood cells, potentiation of diuresis.
6. **Other:** rash, hyperglycemia and inappropriate AOH syndrome.

OVERDOSEAGE; Management: If potential oral overdose is established and seizure has not occurred:

- A. Induce vomiting.
- B. Administer a cathartic (this is particularly important if sustained-release preparations have been taken).
- C. Administer activated charcoal.

If patient is having a seizure:

- A. Establish an airway.
- B. Administer oxygen.
- C. Treat the seizure with intravenous diazepam, 0.1 to 0.3 mg/kg up to 10 mg.
- D. Monitor vital signs, maintain blood pressure and provide adequate hydration.

Post Seizure Care:

- A. Maintain airway and oxygenation.
- B. If a result of oral medication, follow above recommendations to prevent absorption of the drug, but intubation and lavage will have to be performed instead of inducing emesis, and the cathartic and charcoal will need to be introduced via a large bore gastric lavage tube.
- C. Continue to provide full supportive care and adequate hydration while waiting for drug to be metabolized. In general, the drug is metabolized sufficiently rapid so as not to warrant consideration of dialysis; however, if serum levels exceed 50 mcg/ml charcoal hemoperfusion may be indicated.

CAUTION: Federal law prohibits dispensing without prescription. For full prescribing information, see package insert. Revised 6/87

MEDICAL SOCIETY OF NEW JERSEY Long-Term Care Insurance Program

The Committee on Membership Services has announced the following improvements under the MSNJ Long-Term Care Insurance Program:

- Enrollment now is open to individuals age 50 to 84.
- The maximum benefit amount increased to \$120 per day for up to six years of care.
- Full benefits are provided for skilled, intermediate, and custodial care.
- Home convalescent care benefits paid for up to two years at 50 percent of the daily benefit.
- A new inflation protection option is available.

Member physicians have received an explanatory brochure on this program and many have taken advantage of this important form of insurance protection. For members still considering the purchase of long-term care coverage, the new improvements should be of particular interest.

For more information on the many benefits of the improved MSNJ Long-Term Care Insurance Program, member physicians can write to the Committee's insurance consultant at: Donald F. Smith & Associates, PO Box 2197, Princeton, NJ 08543, or call Mr. Stan Farr at (609) 924-8700.

DEPARTMENT OF ENVIRONMENTAL PROTECTION Radon Outreach in New Jersey

In January 1986, legislation was passed appropriating funding for the State Departments of Environmental Protection (DEP) and Health (DOH) to address the radon issue statewide. This legislative appropriation mandated a statewide scientific study of radon (DEP), an epidemiological study (DOH), a confirmatory monitoring program (DEP), and a public information program (DEP and DOH).

In September 1987, DEP made recommendations for testing, based on initial study results from the statewide study as well as other criteria. These recommendations stress the potential for elevated radon levels in counties and municipalities in New Jersey:

- Tier I—All of Hunterdon, Sussex, and Warren counties as well as other municipalities; highest potential for elevated levels of radon. Recommendation: Test as soon as practical.
- Tier II—Potential exists; however, lower than Tier I. Recommendation: Test within one year.

- Tier III—Lowest incidence of elevated levels of radon. Recommendation: Test if concerned.

More than 75,000 calls have been made to the toll-free radon information line at 1/800/648-0394. Any resident concerned with the radon issue or wanting answers to questions should call this number to request an informational package. This package contains a letter to the homeowner explaining DEP's radon program; two U.S. Environmental Protection Agency (EPA) booklets, *A Citizens Guide to Radon* and *Radon Reduction Methods*; a listing of companies that offer radon testing and remediation services; and a brochure published by the Department of Health entitled *Facts and Recommendations on the Exposure to Radon*.

The EPA has established a guideline of 4 picocuries per liter (4 pCi/l) for indoor exposure to radon. Nationwide, the average level of indoor radon is believed to be 1 to 2 pCi/l. It has been estimated that over a million homes may be at risk for elevated levels of radon. If you test for radon and obtain a result of 4 pCi/l or greater, call the Radon Information Line to request confirmatory testing. If the second test results confirm that remediation is necessary, the trained staff of DEP's radon office will consult with the homeowner. After the work is completed, a postremediation test will be performed. There is no charge for these services.

DONALD F. SMITH & ASSOCIATES Group Health Care Insurance Programs

The past year has seen a great deal of activity within the group health care plans sponsored by the Medical Society of New Jersey. Of primary importance was the major underwriting changes implemented by Blue Cross and Blue Shield of New Jersey in the MSNJ Blue Cross/Blue Shield and major medical programs.

The changes, which affect virtually all of the more than 5,500 participating MSNJ members, became effective April 1, 1988, and include the following:

- Blue Cross/Blue Shield and major medical coverages are offered to new participants only as a single, packaged plan. The coverages are not available separately.
- Persons age 65 and over no longer are eligible to enroll as a new participant for Blue Cross/Blue Shield coverage.
- The Blue Shield Series 500, 750, and 14/20 fixed-fee payment schedules no longer are offered to new

The New Jersey State Department of Health is offering confidential HIV-positive partner notification assistance to all physicians throughout New Jersey. The program, Notification Assistance Program (NAP), originally was announced in March 1988 through a letter to all physicians from Molly Joel Coye, M.D., M.P.H., state commissioner of health. In that announcement, Dr. Coye notified all physicians that trained, professional state health department staff are available to work with physicians and their HIV-positive patients. NAP staff will provide face-to-face counseling to the sexual and needle-sharing partners of HIV patients who are being treated by private physicians. This information is conveyed in a confidential and sensitive manner, without identifying the HIV-positive patient or physician who supplied the identifying information about their partners. Indeed, the notifiers never are the same person who originally obtained the information.

The Department is encouraged by its early efforts,

having successfully contacted 23 clients, all of whom responded favorably to being contacted and notified about being involved with an HIV-positive individual. All those contacts have made appointments at counseling and testing sites to receive indepth pretest counseling. Additional staff have been added since March which allows followup to the partners of HIV clients and also to HIV-positive clients who do not return for their test results. Notification Assistance Program services also are available to frank AIDS cases who are concerned about past or current partners and are unable or unwilling to notify their partners about their possible exposure to HIV.

NAP staff are available to provide indepth presentations about the program and can be contacted at 1-800-367-6543. Any physician wishing to obtain more details about the program or wishing to utilize the services of the Notification Assistance Program also can call 1-800-367-6543.

participants or as an upgrade to current participants.

- All participants must be enrolled for the same contract class (i.e. single or family) under both Blue Cross/Blue Shield and major medical.

- For all employer groups, 75 percent of the eligible employees (or 100 percent if the group has under 10 members) must participate. For dependent coverage to be made available, at least 25 percent of the eligible dependents must be covered.

- For existing employer groups that provide Blue Cross/Blue Shield and major medical, all participating employees must be enrolled for both lines of coverage.

All participating employer groups and individual MSNJ members were advised of the Blues' new underwriting regulations in December 1987. The notice explained the changes in detail and outlined the ramifications of each new provision. In the first week of February, employer groups that were not in compliance with the new consistent enrollment or minimum participation requirements were notified of the options available for bringing their group plan within the new underwriting parameters established by Blue Cross/Blue Shield.

The overall effects of the Blues' new underwriting regulations are expected to produce more stable claims experience and premium rates.

Also, MSNJ introduced a new long-term care insurance program at the beginning of 1988. The program is designed to provide members with valuable insurance protection against the high cost of skilled, intermediate, and custodial nursing care. Despite being available for only a few months, the response to this new MSNJ-sponsored long-term care insurance program has been very positive.

The following presents a summary of the MSNJ-sponsored Blue Cross/Blue Shield, major medical, dental, and long-term care insurance programs and their operations during the past year.

Blue Cross/Blue Shield Program. The MSNJ Blue Cross/Blue Shield program provides coverage to newly enrolled employer groups through the comprehensive Blue Cross contract and the Blue Shield P.A.C.E. payment schedule.

The MSNJ program continues to offer many valuable contractual provisions that are unavailable to members who purchase coverage directly from the Blues. These important advantages include:

- Paid-in-full coverage for stays in nonmember hospitals outside New Jersey.

- Instead of the regular provision for 120 days per benefit year, there are 120 days of hospitalization benefits per admission.

- Coverage for pre-existing conditions at the time of enrollment.

- Rider J 365 coverage for all participants.

- Full hospital benefits for mental conditions, tuberculosis, drug addiction, and contagious diseases which normally are limited to 30 benefit days.

- Coverage for dependent children through the end of the calendar year in which they turn age 23.

- No reduction in benefits when covered members reach age 65.

- Lifelong coverage under the MSNJ group for covered persons and/or their surviving spouses.

The recent claims experience of participants under age 65 has been extremely high. As a result, Blue Cross and Blue Shield of New Jersey requested an average rate increase of 33 percent effective January 1, 1988. After lengthy negotiations, and by using surplus funds from the 1986 coverage year, the MSNJ Committee on Membership Services was able to lower the average increase to 25 percent. Because the actual rate increase varies by program and type of contract, most participants' rates increased slightly more or less than 25 percent.

Premium rates for persons age 65 and over no longer are set by the New Jersey insurance commissioner. Projected costs for all participants now are determined from the combined claims experience of those under age 65 and those age 65 and over. Separate premium rates then are established for each age group according to actuarial studies derived from the Blues' own claims records. These studies found that past premium rates for persons age 65 and over were much too low to cover actual claim costs. The new method of determining premium rates for this age group re-

sulted in a significant rate increase effective January 1, 1988.

There are approximately 5,500 MSNJ members and their employees enrolled under the Blue Cross/Blue Shield program, with the total number of covered persons estimated at more than 14,000.

Major Medical Program. Supplementing the benefits provided by basic Blue Cross/Blue Shield coverage, the MSNJ group major medical insurance program provides unlimited calendar year and lifetime benefits (except for mental care services). The plan also offers participants the choice of a \$200, \$500, or \$1000 calendar year deductible, with a maximum of two deductibles per family in any one year.

The program pays 80 percent of all eligible charges (50 percent for out-of-hospital mental care) and when covered medical expenses reach \$15,000 in a calendar year, the major medical program pays 100 percent of allowable charges for the remainder of that year.

Covered medical services and supplies include physician office visits, prescription drugs, x-rays, diagnostic lab procedures, private duty nursing care, ambulance service, durable medical equipment, and many other expenses.

As evidence of the importance of major medical coverage, benefit utilization under the program has continued to increase. However, to meet the spiralling costs of anticipated claims, the premium rates were increased by an average of 34 percent on January 1, 1988.

At this time, there are approximately 3,000 MSNJ members and their employees, and more than 5,000 covered dependents, enrolled for this excellent major medical insurance protection.

Dental Insurance Program. The MSNJ dental insurance program divides covered dental procedures into four major categories: preventive/diagnostic care, basic care, major care, and orthodontia. There is a \$1,000 per person annual benefit maximum for the first three categories and a separate \$1,000 lifetime maximum for orthodontia services. The \$50 annual deductible is limited to three family members per year.

All benefits are paid on a usual, customary, and reasonable basis in accordance with the following coinsurance schedule:

100%—Preventive/Diagnostic Care, including teeth cleaning, fluoride treatment, x-rays, periodic exams, and other routine services.

80%—Basic Care, including extractions and oral surgical services, fillings, root canal therapy, and inlays.

50%—Major Care, such as crowns, bridges, dentures, and periodontal services.

50%—Orthodontia, including diagnosis, x-rays, installation of appliances, and monthly and retention treatments.

The claims experience under the MSNJ dental program was much better than anticipated for the nine-month period ending December 31, 1986. As a result, a refund of almost 25 percent of premiums was returned to participants.

Despite the favorable claims experience during the 1986 coverage period, program costs in 1988 are projected to rise and a 9 percent premium increase took effect January 1, 1988. This increase follows last year's

12 percent decrease so that participants' costs for dental insurance still is lower than it was two years ago.

The MSNJ dental insurance program currently provides coverage to more than 2,500 member physicians, employees, and dependents.

Long-Term Care Insurance. The long-term care program is the MSNJ's newest sponsored health insurance plan. First introduced in February 1988, this valuable insurance program pays up to \$100 in daily cash benefits for long-term skilled, intermediate, and custodial care in a skilled nursing facility. Also, 50 percent of the daily benefit amount is provided if convalescent care is needed in the patient's home following a qualified skilled nursing facility stay.

Benefits are paid for as long as four years of skilled nursing facility care and two years of convalescent care. All benefit payments are sent directly to the policy holder.

The MSNJ long-term care insurance program is designed so that individual participants can structure the coverage to meet their exact financial needs. Benefits are available in amounts ranging from \$40 to \$100 per day with either a 20-day or 100-day benefit waiting period. Participants also may opt to waive the standard three-day prior hospitalization requirement.

Other advantages include: coverage may be purchased for any person who qualifies; benefits are paid in addition to any other insurance coverage the person may be entitled to; premiums are waived after benefits have been paid for 90 days; and helpful claims representatives eliminate red tape and administrative problems.

The program is made available to all MSNJ members between the ages of 55 and 84. All coverage is contingent upon satisfactory medical history at the time of enrollment.

Conclusion. The MSNJ Committee on Membership Services recognizes that the 1988 Blue Cross/Blue Shield and major medical rate increases are substantial. The increases do, however, reflect the overall utilization of benefits by participating members.

Despite the apparent need for justifiable rate increases, the Committee is pursuing alternatives to the current Blue Cross/Blue Shield and major medical programs. In the coming months, the Committee will review health care insurance programs proposed by commercial insurers that are interested in underwriting the MSNJ group. Other options that are being investigated include self-insurance, alternative funding arrangements, and various cost-containment initiatives.

Participants will be kept advised of all future developments concerning the MSNJ Blue Cross/Blue Shield and major medical programs.

The Committee is pleased with the membership's initial response to the new long-term care insurance plan. Scores of members have called for additional details after receiving the original announcement and brochure. Many members or their spouses and parents already are enjoying the assurance that nursing home costs will not deplete their life savings.

The MSNJ Committee on Membership Services will continue to work toward providing members with attractive health care insurance programs that are efficiently administered and professionally serviced.

BETTER CARE MEANS GOING THAT EXTRA MILE.

From the moment patients arrive at The Mid-Atlantic Kidney Stone Center, we want them to feel comfortable and at ease. We begin by showing them a videotape explaining the lithotripsy treatment process, followed by a tour of our facility. Along the way we introduce them to the staff who will be providing their care.

We then make every effort to answer patient questions and address their concerns. Even though they are in our care for just a few hours, we do our best

to make the experience as pleasant as possible. Patients appreciate the personalized care at the Mid-Atlantic Kidney Stone Center.

With three years of experience as a lithotripsy service, we have treated 4000 kidney stone patients from New Jersey, Eastern Pennsylvania,

metropolitan New York and Delaware. We believe that our expertise makes us uniquely qualified to serve you and your patients.

If needed, we offer complimentary transportation and hotel accommodations for patients traveling to the Mid-Atlantic Kidney Stone Center. To find out more about our service, or how you can obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (800) 53-LITHO or 609-983-7337.

Forced Medicare Bill Prodded; Courtesy Pamphlet Debuts; Auto Insurance Law; Society Fights Malpractice Surcharge; Higher Medicaid Fees; Frivolous Suit Law Enacted

"FORCED MEDICARE" BILL PRODDED

The Assembly sponsor of the mandatory Medicare assignment bill, A-2305, has taken steps to try to snatch the measure out of the Health Committee and place it in position for a floor vote.

Assemblyman Alan J. Karcher (D-Sayreville) has filed notice that at a future Assembly session, he will move to relieve the Committee of the bill. To succeed, the motion would need 41 affirmative votes.

Naturally, the Society is actively working to defeat Karcher's initiative. We are contacting numerous Assemblymen to reconfirm that medicine has sufficient support for its position on this troublesome issue. Assemblyman Karcher, for his part, also is working doggedly to strengthen the bill's prospects. Aided by an organization called United Senior Action (many physicians have seen this group's letters in the newspapers under the signature of its chief spokesman, Al Evanoff), Karcher has persuaded 17 of his Assembly colleagues to add their names to A-2305 as cosponsors.

All of the cosponsors are Democrats, and many are freshmen who were not in office when "forced Medicare" was rejected unanimously by the Health Committee last year. From our discussions with these legislators, the Society has learned that at least some of the Assemblymen were unaware of the political volatility of the issue.

When will Assemblyman Karcher attempt to seize the bill from Committee? It's difficult to say. Parliamentary rules entitle legislators to make such motions at their convenience. Since we can't predict when that will be, the best thing is for all physicians to contact

their Assemblymen now and ask them to oppose Assemblyman Karcher's motion to relieve the Health Committee of A-2305. Remind Assemblymen that the Committee—with the same five members—last year voted the bill down unanimously after hearing hours of testimony.

"COURTESY" PAMPHLET DEBUTS

An attractive new pamphlet announcing the Senior Medical Courtesy Program now is available and has been sent to legislators, county medical societies, offices on aging, and senior citizens' councils.

Unveiled on September 10, 1988, at the Senior Games at Kean College, the pamphlet explains how Senior Medical Courtesy will find a conveniently located physician to treat eligible senior patients at the Medicare assignment rate.

While vocal supporters of the "forced Medicare" bill are busy at work maligning Senior Medical Courtesy, the program is growing rapidly. At this writing, more than 3,500 physicians have volunteered to participate, and some 2,600 patients throughout the state have enrolled. Now that all 120 legislators have received the pamphlet, county societies can expect an increasing number of inquiries about the program.

AUTO INSURANCE LAW

After years of legislative "ping-pong"—bills bouncing back and forth between the Senate and the Assembly—the Legislature and Governor Kean have settled on a new law which makes several changes, including a medical fee schedule, in New Jersey's auto insurance statutes.

The law calls for the Insurance Department to adopt, by next July, a fee schedule to cover medical services for auto accident victims. The schedule will be established on a regional basis, and will be reviewed every other year for adjustments. Balance billing is permitted.

It could have been a lot worse. Medical fee provisions in auto insurance bills which had been approved in one house or the other during the past several months included a maximum \$10,000 coverage; a state-administered "catastrophic" fund for medical expenses over \$75,000; physician DRGs, and a schedule based on Blue Shield rates.

Much negotiation with the Insurance Department lies ahead for the Society to assure that a reasonable schedule is adopted.

SOCIETY FIGHTS MALPRACTICE SURCHARGE

The Society has called on Governor Thomas H. Kean to intervene in the State Insurance Department's plan to impose more than \$60 million in the liabilities of a defunct, cut-rate medical malpractice insurance company on thousands of physicians who had no involvement in the losses.

In a letter to the Governor, Palma E. Formica, M.D., urged him to meet with the Executive Committee "in an open, nonconfrontational forum" to discuss the problem created by the deficit of the New Jersey Medical Malpractice Reinsurance Association.

*Mr. Martin is MSNJ's legislative consultant.

The Association, which was created by the Insurance Department in 1976, sold underpriced malpractice insurance for six years. As a result, it holds an estimated \$22 million in reserves, but anticipates at least \$82 million in claims over the next decade.

Beginning January 1, 1989, the Department wants to impose a 5 percent annual surcharge for seven years on the malpractice premiums of 13,400 physicians and podiatrists in order to eliminate the shortfall.

Under the Department's proposal, physicians who are insured by the Medical Inter-Insurance Exchange of New Jersey (MIENJ) and other carriers, and who paid higher premiums during the time that the Reinsurance Association was in business, would pay the same surcharge as those who purchased the state-sponsored "bargain" insurance. And the Reinsurance Association's 3,500 insured who no longer are practicing in New Jersey would pay no surcharge—even though they may have been responsible for losses.

Dr. Formica's letter asked: "Is it fair to require thousands of responsible physicians who paid dearly for their malpractice insurance during the years when the state offered bargain rates, and who pay even more dearly for their insurance today, to be saddled with the burden of making good the state's debt?"

The Society and MIENJ also are exploring legislative and legal remedies in order to stop the surcharge.

HIGHER MEDICAID FEES

For the first time in 15 years, higher fees are being paid to physicians who care for New Jersey's Medicaid patients. The fee increase—which took effect in August and will be followed by another boost next spring—results from the Society's cooperative efforts with the Department of Human Services and from its work with the Legislature and the Governor's office.

With the new fee schedule, the Society is making progress toward achieving one of its top legislative priorities: a Medicaid program which will foster continuity of treatment for patients who today can receive primary care only in costly hospital outpatient facilities and emergency rooms.

A sampling of the new schedule shows that the fee for a routine visit to a nonspecialist increased from \$7

to \$10 on August 1, and will jump to \$14 next May 1; for a specialist, the \$9 fee went to \$12 in August, and will increase to \$16 next May.

Basic fees for obstetricians increased from \$236 to \$308 this month, and then go to \$468 next April 1. Pediatricians received a single increase for routine newborn care, a \$5 hike to \$27, which took effect on August 1.

While the increase for routine office visits—which will amount to 100 percent by next May—is most gratifying, more must be done for specialists. The Society will continue its work on this issue.

"FRIVOLOUS SUIT" LAW ENACTED

Governor Kean has signed legislation which, when it takes effect in late December, will help persuade attorneys not to "go fishing" by filing law suits which lack merit.

The bill, A-1316/751, was sponsored by Assemblywoman Maureen Ogden (R-Millburn) and Assemblyman Thomas Shusted (R-Westmont). It permits a party who wins in a civil suit to recover attorney fees and litigation costs from the loser, if the judge finds that the legal position of the losing party was frivolous.

Under the new law, Chapter 46 of the Laws of 1988, a judge can label the losing party's suit as frivolous if he finds that:

"(1) The complaint, counterclaim, cross-claim, or defense was commenced, used, or continued in bad faith, solely for the purpose of harassment, delay, or malicious injury; or

(2) The nonprevailing party knew, or should have known, that the complaint, counterclaim, cross-claim, or defense was without any reasonable basis in law or equity and could not be supported by a good faith argument for an extension, modification, or reversal of existing law."

A-1316/751 is the third tort reform measure to be enacted which could help reduce medical malpractice insurance premiums. The other beneficial new laws provide for a "collateral source offset" in monetary judgments (in other words, it stops insurance double-dipping) and lighten the burden of joint and several liability.

PromptCare

"We care . . . about your health"

Attention Hospital Executives and Physicians:

ARE YOU READY TO JOINT VENTURE WITH YOUR MEDICAL STAFF?
ARE YOU READY TO ASSUME ECONOMIC CONTROL OVER YOUR MEDICAL PRACTICE?

ARE YOU READY TO ASSUME CLINICAL LEADERSHIP FOR YOUR PATIENTS DISCHARGED "QUICKER & SICKER" WHO REQUIRE AIDS THERAPY, OXYGEN OR DME?

ARE YOU READY TO JOIN 2,000 NEW JERSEY PHYSICIANS IN GROUP PURCHASING OF MEDICAL AND OFFICE SUPPLIES? DO YOU NEED HELP WITH OFFICE MEDICAL WASTE DISPOSAL?

PromptCare has helped eleven groups of physicians and nineteen hospitals establish their own Home Health Care Equipment and Medical Office Supply companies. No more just signing forms for outsiders without input. No more profits to outsiders for necessary office expenses. No more national firms coming into New Jersey.

If you and your peers are interested, please contact Mr. Michael Garippa, President, at 355-0200 or 1-800-451-0038. As few as 15 physicians can create a new group.

The PromptCare Companies—The largest collective physician effort in NJ business: Summit, Rahway, Elizabeth, Corvas, Plainfield, Ocean, Atlantic, Hudson County, Raritan, Cathedral and Passaic.

We're putting lives back together.

As a physician you've probably seen it. A family's struggle against alcohol or drugs. A man or woman afraid to ask for help in dealing with depression. A young girl hiding an eating disorder behind a smiling face or popular personality.

At the Carrier Foundation, we work with physicians in treating troubled adolescents and adults. Unlike most general hospitals, all our resources are dedicated to this mission. And have been for more than seventy-five years.

Recognized by all major insurance companies, Carrier is a private, non-profit psychiatric hospital providing both inpatient and outpatient programs. Some of Carrier's specialized programs include: addiction recovery service, adolescent program, affective disorders program, behavioral therapy, eating disorders program, family therapy, geriatric program and women's program.

For more information, call the Carrier Foundation at 1-800-223-0207. The Carrier Foundation. We're putting lives back together.

Costs and Claims

Cost Versus Quality; Employer of Injured Worker Can Share in Proceeds of Medical Malpractice Claim

COST VERSUS QUALITY

Troubled by back and leg problems, a woman entered a hospital in Van Nuys, California, for two operations. When her recovery was slower than expected, the patient's physician asked Medi-Cal, California's medical assistance program, which was paying her bill, to grant an eight-day hospital stay extension.

A Medi-Cal nurse at the hospital decided she could not approve the whole extension. She telephoned a Medi-Cal consulting physician who granted only a four-day extension.

Shortly after being discharged, the patient developed clotting and an infection in her leg. Nine days after she was discharged, the patient was hospitalized again and her leg had to be amputated.

She later sued Medi-Cal. At trial, her physician testified that if his patient had not been discharged earlier than recommended, the problems would have been corrected in time to save her leg.

A jury awarded the patient \$500,000. A California court of appeals decision reversed the judgment, finding that the medical decision to discharge her met the applicable standard of care. The court also noted that the treating physicians did not try to appeal the early discharge decision.

That 1986 case was important because it was the first judicial consideration of the tradeoff between the cost-containment process of "utilization review" and medical malpractice liability, according to Barry Furrow, a Delaware Law School professor who spoke at an ABA Medical Malpractice National Institute in Reno in March.

Although Medi-Cal was not liable, the decision warns physicians and third-party payors of health care that they can be held legally accountable. The California court stated: "The patient who requires treatment and who is harmed when care which should have been provided is not provided should recover for injuries suffered from all those responsible for the deprivation of such care including, when appropriate, health care payors."

The court concluded that "While we recognize, realistically, that cost consciousness has become a permanent feature of the health care system, it is essential that cost limitation programs not be permitted to corrupt medical judgment."

If a physician, against his better judgment, discharges a patient when reimbursement is denied, he risks liability for malpractice, said the professor. So does the utilization-review body that negligently reviews the patient's record.

"It reveals judicial hostility to the argument that cost constraints should get a physician off the hook for patient injury, or that sloppy utilization review is tolerable," said the professor.

He said as pressures continue to mount to control medical costs, more cases will pit quality of care against cost containment.

Michael D. Roth, a Los Angeles attorney who represents health care providers nationally, agrees. "If health care providers are not careful, I think you will see more than a rash of these suits," he said.

In a case similar to the one aforementioned, Blue Cross is a defendant in a \$10 million suit pending in Los Angeles superior court, according to Roth. He said the suit alleges that the premature discharge of a patient undergoing chemical detoxification resulted in the patient dying of an overdose three weeks later.

Given the potential liability in these cases, Roth suggests that lawyers advising utilization-review programs ensure the programs take steps to reduce their exposure. He provides the following basic checklist:

- Nurse reviewers should be licensed and have received utilization-review training.
- Physician reviewers should be specialists in the patient's medical care area.
- Before issuing a denial, physician reviewers should thoroughly discuss the case with the attending physician, preferably review the patient's records, and if feasible, examine the patient.
- If a denial is issued, the patient or physician must be allowed to appeal the decision to a panel of physicians for further review.
- Before implementing or agreeing to comply with medical criteria to be used in evaluating admissions

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department and Director of Special Projects.

and length of stay, allow enough time to evaluate their appropriateness.

- Hospitals should establish mechanisms to monitor and supervise utilization-review programs on their premises.

Addendum. The 1988 House of Delegates of the Medical Society of New Jersey recommended that third-party payor peer review activities be held accountable to the same standards as are plenary licensed physicians.

The following is a response from Frank J. Malta, M.D., president of the New Jersey State Board of Medical Examiners (May 26, 1988):

The New Jersey Board of Medical Examiners has taken the position that peer review activity which encompasses all of the components of decision making into the appropriateness of patient care requires a current plenary license. Therefore, peer review activity involves the practice of medicine. It would not be appropriate for third-party payors to deny care based on cost consideration alone. Rather, care should be rendered based on the necessity of care in accordance with acceptable standard of practice. Therefore, the Board's position is that the final determination for the appropriateness of care is a physician and not a non-physician reviewer.

This Board has articulated that position in the past, noting that medical experts and those participating in peer review activities who fail to meet the standard of acceptable practice could be found guilty of professional misconduct, and thereby subject to disciplinary action under the Medical Practice Art.

This Board has the responsibility by mandate of the Legislature to protect the health, safety, and welfare of the public. It is charged with the responsibility of investigating complaints from all arenas. It is apparent that concerns expressed by the Medical Society's House of Delegates was prompted by improper conduct by third-party payors or independent reviewers. The Board recommends that letters of complaint be filed with the Board for appropriate and expeditious investigation.

(Paul Marcotte, *American Bar Association Journal*, June 1, 1988).

EMPLOYER OF INJURED WORKER CAN SHARE IN PROCEEDS OF MEDICAL MALPRACTICE CLAIM

A statute precluding an employer's independent action against physicians, chiropractors, and podiatrists whose negligence aggravated an employee's work-related injuries was unconstitutional, a Wisconsin appellate court ruled. An employee became a quadriplegic as a result of negligent treatment for a work-related injury. He was permanently and totally disabled.

The employee settled his malpractice claim against the treating physician. His employer then sought subrogation rights in the settlement because it was obligated to pay workers' compensation for the injury as enhanced by the negligence. The trial court found that the applicable statute precluded an independent action against the treating physician. However, the court found that the statute violated the equal protection of the laws and was unconstitutional.

The employee appealed the judgment finding the statute unconstitutional. The court said that an employer generally had the right to maintain an action against and share in the recovery from any party who also was liable for an employee's work-related injury. The effect of the statute was to deny subrogation to a limited class of employers—those whose employee injuries were aggravated by the negligence of physicians, chiropractors, or podiatrists. All other employers whose employees' injuries were aggravated by a third party could recover under the statute.

The court said that if the statute had been applied to a malpractice claim against any health care provider, there would be a rational basis for the classification. However, the statute was limited to claims against physicians, chiropractors, and podiatrists. Finding that the limited application of the statute denied certain employers equal protection of the law because it was arbitrary and not rationally related to a legitimate state interest, the court affirmed the lower court's judgment. (Reprinted from *THE CITATION* with permission, American Medical Association, 535 N. Dearborn Street, Chicago IL 60610, April 1, 1988, Volume 56, No. 12)

LEVOXINE®

(LEVOTHYROXINE SODIUM TABLETS, USP)

FOR ORAL ADMINISTRATION

DESCRIPTION:

Each LEVOXINE (Levothyroxine Sodium, USP) tablet contains synthetic crystalline levothyroxine sodium (L-thyroxine). L-thyroxine is the principal hormone secreted by the normal thyroid gland. Chemically, L-thyroxine is designated as L-tyrosine, 0-(4-hydroxy-3, 5-diiodophenyl) - 3,5-diiodo-L-tyrosine sodium salt, hydrate. The molecular formula is $C_{15}H_{10}I_2NNaO_4$ and the structural formula is:

CLINICAL PHARMACOLOGY:

The principal effect of thyroid hormones is to increase the metabolic rate of body tissues.

The thyroid hormones are also concerned with growth and development of tissues in the young.

The major thyroid hormones are L-thyroxine (T_4) and L-triiodothyronine (T_3). The amounts of T_4 and T_3 released from the normally functioning thyroid gland are regulated by the amount of thyrotropin (TSH) secreted from the anterior pituitary gland. T_4 is the major component of normal thyroid gland excretions and is therefore the primary determinant of normal thyroid functions. T_4 acts as a substrate for physiologic deiodination to T_3 in the peripheral tissues. The physiologic effects of thyroid hormones are mediated at the cellular level primarily by T_3 .

LEVOXINE (L-thyroxine) tablets taken orally provide T_4 which upon absorption can not be distinguished from T_4 that is secreted endogenously.

INDICATIONS AND USAGE:

LEVOXINE (L-thyroxine) tablets are indicated as replacement or supplemental therapy for diminished or absent thyroid function (e.g., cretinism, myxedema, nontoxic goiter or hypothyroidism generally, including the hypothyroid state in children, in pregnancy and in the elderly) resulting from functional deficiency, primary atrophy, from partial or complete absence of the gland or from the effects of surgery, radiation or antithyroid agents. Therapy must be maintained continuously to control the symptoms of hypothyroidism.

CONTRAINDICATIONS:

L-thyroxine therapy is contraindicated in thyrotoxicosis, acute myocardial infarction and uncorrected adrenal insufficiency.

WARNINGS:

Drugs with thyroid hormone activity, alone or together with other therapeutic agents, have been used for the treatment of obesity. In euthyroid patients, doses within the range of daily hormonal requirements are ineffective for weight reduction. Larger doses may produce serious or even life-threatening manifestations of toxicity, particularly when given in association with sympathomimetic amines such as those used for their anorectic effects.

PRECAUTIONS:

General — Caution must be exercised in the administration of this drug to patients with cardiovascular disease. Development of chest pains or other aggravation of the cardiovascular disease requires a reduction of dosage.

LEVOXINE (L-thyroxine) 100 mcg (0.1 mg), 200 mcg (0.2 mg) and 300 mcg (0.3 mg) tablets contain FD & C Yellow No. 5 (tartrazine) which may cause allergic-type reactions (including bronchial asthma) in certain susceptible individuals. Although the overall incidence of FD & C Yellow No. 5 (tartrazine) sensitivity in the general population is low, it is frequently seen in patients who also have aspirin hypersensitivity.

Information For The Patient — Patients on thyroid preparations and parents of children on thyroid therapy should be informed that:

1. Replacement therapy is to be taken essentially for life, with the exception of cases of transient hypothyroidism, usually associated with thyroiditis, and in those patients receiving a therapeutic trial of the drug.
2. They should immediately report during the course of therapy any signs or symptoms of thyroid hormone toxicity, e.g., chest pain, increased pulse rate, palpitations, excessive sweating, heat intolerance, nervousness, or any other unusual event.
3. In case of concomitant diabetes mellitus, the daily dosage of antidiabetic medication may need readjustment as thyroid hormone replacement is achieved. If thyroid medication is stopped, a downward readjustment of the dosage of insulin or oral hypoglycemic agent may be necessary to avoid hypoglycemia. At all times, close monitoring of urinary glucose levels is mandatory in such patients.

4. In case of concomitant oral anticoagulant therapy, the prothrombin time should be measured frequently to determine if the dosage of oral anticoagulants is to be readjusted.

5. Partial loss of hair may be experienced by children in the first few months of thyroid therapy, but this is usually a transient phenomenon and later recovery is usually the rule.

Laboratory Tests — The patient's response to thyroid replacement may be followed by laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels.

Drug Interactions — In patients with diabetes mellitus, addition of thyroid hormone therapy may cause an increase in the required dosage of insulin or oral hypoglycemic agents. Therefore, patients with diabetes mellitus should be observed closely for possible changes in antidiabetic drug dosage requirements.

Patients stabilized on oral anticoagulants who are found to require thyroid replacement therapy should be watched very closely when therapy is started. If a patient is truly hypothyroid, it is likely that a reduction in anticoagulant dosage will be required. No special precautions appear to be necessary when oral anticoagulant therapy is begun in a patient already stabilized on maintenance thyroid replacement therapy.

Cholestyramine binds both T_4 and T_3 in the intestine, thus impairing absorption of these thyroid hormones. In vitro studies indicate that the binding is not easily removed. Therefore, four to five hours should elapse between administration of cholestyramine and thyroid hormones.

Estrogens tend to increase serum thyroxine-binding globulin (TBG). In a patient with a non-functioning thyroid gland who is receiving thyroid replacement therapy, free thyroxine may be decreased when estrogens are started thus increasing thyroid requirements. However, if the patient's thyroid gland has sufficient function the decreased free thyroxine will result in a compensatory increase in thyroxine output by the thyroid. Therefore, patients without a functioning thyroid gland who are on thyroid replacement therapy may need to increase their thyroid dose if estrogens or estrogen containing oral contraceptives are given.

Drug/Laboratory Test Interactions — The following drugs or moieties are known to interfere with laboratory tests performed on patients taking thyroid hormone: androgens, corticosteroids, estrogens, oral contraceptives containing estrogens, iodine-containing preparations, and the numerous preparations containing salicylates.

1. Changes in TBG concentration should be taken into consideration in the interpretation of T_4 and T_3 values. In such cases, the unbound (free) hormone should be measured. Pregnancy, estrogens, and estrogen-containing oral contraceptives increase TBG concentrations. TBG may also be increased during infectious hepatitis. Decreases in TBG concentrations are observed in nephrosis, acromegaly, and after androgen or corticosteroid therapy. Familial hyper- or hypo-thyroxine-binding-globulinemias have been described. The incidence of TBG deficiency approximates 1 in 9000. The binding of thyroxine by thyroid-binding prealbumin (TBPA) is inhibited by salicylates.

2. Medical or dietary iodine interferes with all in vivo tests of radio-iodine uptake, producing low uptakes which may not be reflective of a true decrease in hormone synthesis.

3. The persistence of clinical and laboratory evidence of hypothyroidism in spite of adequate dosage replacement indicates either poor patient compliance, poor absorption, excessive fecal loss, or inactivity of the preparation. Intracellular resistance to thyroid hormone is quite rare.

Carcinogenesis, Mutagenesis, And Impairment Of Fertility

— A reportedly apparent association between prolonged thyroid therapy and breast cancer has not been confirmed and patients on thyroid for established indications should not discontinue therapy. No confirmatory long-term studies in animals have been performed to evaluate carcinogenic potential, mutagenicity or impairment of fertility in either males or females.

Pregnancy — Category A — Thyroid hormones do not readily cross the placental barrier. The clinical experience to date does not indicate any adverse effect on fetuses when thyroid hormones are administered to pregnant women. On the basis of current knowledge, thyroid replacement therapy to hypothyroid women should not be discontinued during pregnancy.

Nursing Mothers — Minimal amounts of thyroid hormones are excreted in human milk. Thyroid is not associated with serious adverse reactions and does not have a known tumorigenic potential. However, caution should be exercised when thyroid is administered to a nursing woman.

Pediatric Use — Pregnant mothers provide little or no thyroid hormone to the fetus. The incidence of congenital hypothyroidism is relatively high (1:4,000) and the hypothyroid fetus would not derive any benefit from the small amounts of hormone crossing the placental barrier. Routine determinations of serum (T_4) and/or TSH is strongly advised in neonates in view of the deleterious effects of thyroid deficiency on growth and development.

Treatment should be initiated immediately upon diagnosis and maintained for life, unless transient hypothyroidism is suspected; in which case, therapy may be interrupted for 2 to 8 weeks after the age of 3 years to reassess the condition. Cessation of therapy is justified in patients who have maintained a normal TSH during those 2 to 8 weeks.

ADVERSE REACTIONS:

Adverse reactions are due to overdosage and are those of induced hyperthyroidism.

OVERDOSAGE — Excessive dosage of thyroid medication may result in symptoms of hyperthyroidism. Since, however, the effects do not appear at once, the symptoms may not appear for one to three weeks after the dosage regimen is begun. The most common signs and symptoms of overdosage are weight loss, palpitation, nervousness, diarrhea or abdominal cramps, sweating, tachycardia, cardiac arrhythmias, angina pectoris, tremor, headache, insomnia, intolerance to heat and fever. If symptoms of overdosage appear, discontinue medication for several days and reinstitute treatment at a lower dosage level.

Laboratory tests such as serum T_4 , serum T_3 and the free thyroxine index will be elevated during the period of overdosage.

Complications as a result of the induced hypermetabolic state may include cardiac failure and death due to arrhythmia or failure.

TREATMENT OF OVERDOSAGE — Dosage should be reduced or therapy temporarily discontinued if signs and symptoms of overdosage appear. Treatment may be reinstituted at a lower dosage. In normal individuals, normal hypothalamic-pituitary-thyroid axis function is restored in 6 to 8 weeks after thyroid suppression.

Treatment of acute massive thyroid hormone overdosage aimed at reducing gastrointestinal absorption of the drugs and counteracting central and peripheral effects, mainly those increased sympathetic activity. Vomiting may be induced initially if further gastrointestinal absorption can reasonably be prevented and barring contraindications such as coma, convulsions, a loss of the gagging reflex. Treatment is symptomatic and supportive. Oxygen may be administered and ventilation maintained. Cardiac glycosides may be indicated if congestive heart failure develops. Measures to control fever, hypoglycemia, or fluid loss should be instituted if needed. Antiadrenergic agents, particularly propranolol, have been used advantageously in the treatment of increased sympathetic activity. Propranolol may be administered intravenously at a dosage of 1 to 3 mg over a 10 minute period orally, 80 to 160 mg/day, especially when no contraindications exist for its use.

DOSAGE AND ADMINISTRATION:

The goal of therapy should be the restoration of euthyroidism as judged by clinical response and confirmed by appropriate laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels. The age and general condition of the patient and the severity and duration of hypothyroid symptoms determine the starting dosage and the rate of incremental dosage increase leading to a final maintenance dosage.

In otherwise healthy adults, the recommended initial dose is 25 to 100 mcg (0.025 to 0.1 mg) daily, while the predicted maintenance dose of 100 to 200 mcg (0.1 to 0.2 mg) daily may be achieved in two to three weeks.

In the elderly patient with long standing disease, evidence of myxedema, or evidence of cardiovascular dysfunction, the initial dose may be as little as 12½ mcg (0.0125 mg) per day. Incremental increases of 25 mcg (0.025 mg) per day at 3 to 4 week intervals may be instituted depending on patient response. It is the physician's judgement of the severity of the disease and close observation of patient response which determine the rate and extent of dosage increase.

In infants and children there is a great urgency to achieve thyroid replacement because of the critical importance of thyroid hormone in sustaining growth and maturation. Despite smaller body size, the dosage needed to sustain a full rate of growth, development and general thriving is higher in the child than in the adult. The recommended daily replacement dosage of L-thyroxine in childhood is: 0-1 years: 9 mcg/kg; 1-5 years: 6 mcg/kg; 6-10 years: 4 mcg/kg; 11-20 years: 3 mcg/kg daily.

DOSAGE FORMS AVAILABLE:

LEVOXINE (L-thyroxine) tablets are supplied as oval, coded, potency marked tablets in 10 strengths, 12½ mcg (0.0125 mg) — maroon, 25 mcg (0.025 mg) — orange, 50 mcg (0.05 mg) — white, 75 mcg (0.075 mg) — purple, 100 mcg (0.1 mg) — yellow, 125 mcg (0.125 mg) — brown, 150 mcg (0.15 mg) — blue, 175 mcg (0.175 mg) — turquoise, 200 mcg (0.2 mg) — pink and 300 mcg (0.3 mg) — green in bottles of 100 and 1000, and unit dose in cartons of 10 (10 strips of 10 tablets).

Levoxine[®]

(Levothyroxine Sodium Tablets, USP)

NOW FOR MORE PRECISE DOSING

NEW 12 1/2 mcg

**Finally, a bioequivalent replacement
for Synthroid[®]
that's reasonably priced.**

Introducing Levoxine from Daniels Pharmaceuticals — a breakthrough in quality manufactured Levothyroxine Sodium Tablets, USP. Levoxine is now available in a 12 1/2 mcg tablet for more precise dosing.

Randomized crossover studies comparing the bioequivalency of Levoxine tablets to Synthroid tablets showed no significant difference in thyroxine (T₄), triiodothyronine (T₃) or free thyroxine index (T₇).

Levoxine is available in ten color-coded strengths to assure prescription compliance and patient acceptance. Each strength is put through extensive quality control measures to ensure the highest quality. Prescribe Levoxine, and give your patients exactly what they need at a price that's more affordable.

DOCTORS' BILL

The "collateral source" bill passed by the New Jersey Legislature and signed into law by Governor Kean is a significant victory in the Exchange's efforts to reform the medical malpractice legal system. The Exchange provided the leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. Elimination of some costly inequities in our tort system will help moderate the ever-increasing severity of insurance losses.

LEADERSHIP IN SUPPORT OF MEDICINE

Chairman Henry J. Mineur, M.D. (center) look*

Election 1988

PALMA E. FORMICA, M.D.*

The din and the cacophony of the presidential conventions have settled and we need to turn our attention to the reality of the political scene. As a state medical society, we cannot endorse a particular party or person. Yet, we encourage our members to become involved.

Some have said that it does not matter who is elected president because Congress makes the laws. However, the head of state sets the direction of the nation. We must be concerned with those elected.

Most physicians shy away from political involvement saying they are too busy. Yet, we protest vigorously and vociferously about the intrusion of government into the very practice of medicine. As citizens and physicians, we must become involved if this nation is to remain free.

If party activity is not the way, we can support those who are our friends through private donations or

through the political action committees. We all are aware of AMPAC and JEMPAC, yet only 11 percent of New Jersey physicians participate.

If you personally know a legislator, locally or nationally, you can be the contact person—the key-man—with that individual. Politicians and their families have personal physicians. No other group is shy about contacting representatives.

When a bill needs action, write or call lawmakers. Legislative aides frequently have said that the medical profession does a lot of complaining but very little communicating on issues that are of importance to them. It is easier to change a section of a bill than to have a law repealed.

We do learn some lessons! When the optometrist prescribing bill was introduced, very few grassroots citizens—especially physicians—took the time to write or call their legislators. But, your assemblyman, congressman, or senator need to hear from each of us. The matter was changed when the tort reform bills were in the senate committee and the members of the society were asked to call and write the committee members. Individual senators were deluged with mail and they got the message; the bill was released from committee. We should learn that in politics, as in life, consistency and persistence are the keys.

If we are too busy to call or write, or be involved, have your spouse, children, or office staff speak in our names—or write the letter we sign.

Throughout the state, nurses have sent me hundreds of letters protesting the registered care technicians. The majority were not only form letters but were duplicated and then signed. Most legislative offices are more concerned with the amount of mail for or against an issue than the content of the letter.

These are just a few of the ways we can and must become involved in the political process. Many county medical societies are sponsoring meetings with legislators and aspirants. I urge you to attend these meetings. Make your voice heard. Stop in to see your assemblyman, congressman, and state and national senators. Get to know them and their legislative aides.

Most of all, each of us has the obligation and responsibility of voting on November 8. Democracy will succeed only if we respect and use our right to vote.

**"Medical training taught
me how to cure.
Senior Patient helps
me to care."**

Introducing a new "how to" publication for treating senior patients.

Senior Patient provides practical information designed to help you manage the care of your senior patients.

Its fresh approach in medical journalism presents short, easy-to-read, original articles on a broad range of subjects including emotions and coping, family relationships, death and dying, sleep disorders, community services, relations with institutions, and financial problems and their relation to health.

Each issue also offers "Pearls" from the personal experiences of other physicians, "Quick Currents" about what is happening in legislation relating to senior care, and an "Open Forum" in which readers can react and interact.

It's a concise, informative, "how to" approach in caring.

Senior Patient • 4530 W. 77th St. • Minneapolis, MN 55435 • (612) 835-3222

Dr. George L. Triebenbacher

PALMA E. FORMICA, M.D.

On a sunny day, August 24, 1988, George L. Triebenbacher, M.D., represented the Medical Society of New Jersey at a political meeting. Jocular, enthusiastic, and committed, he exuded the confidence of a man in his prime, who "never felt better." Within a few

hours, his life was unexpectedly truncated by a fatal dysrhythmia while driving home from the meeting.

As physicians, death is a regular part of our lives. It is the reality of the ultimate victor. Death is part of being a doctor. Then comes a time when we are affected personally through the death of a loved one—spouse, relative, or friend. The disbelief, the pain, and the sorrow affects us all. We are vulnerable. We, the healers, are not spared.

How does one sum up the gifts of George Triebenbacher's life?

His devotion to his beloved wife, Theresa, and his love for his children, Peter, John, George, and Pauline, are well known.

Theirs is the greatest loss.

After graduating from the State University of New York Downstate Medical Center in 1955, he served in the Air Force until 1958. He wore many hats: chief of the Outpatient Department; chief of surgery, assistant chief of obstetrics and gynecology, and chief of the nursery. This prepared him well for setting up family practice in Beach Haven. He was so proud of his Island Medical Center. Since 1958, George served his patients on Long Beach Island in an exemplary manner—always physician, counselor, and friend. And, to that island community he brought a bit of Hawaii in his untraditional garb of bright, flowered shirts.

Dr. Triebenbacher was a member of the Long Beach Board of Health since 1984 and of the Ocean County Department of Health since 1975, and was Assistant County Medical Examiner. School physician, bank director (Bay State Bank), national aviation medical examiner, and United States Coast Guard national physician were among his civic titles. George was a communicant of St. Francis Parish in Brant Beach, a

The 1988-1989 Board of Trustees of the Medical Society of New Jersey, at the Annual Meeting. Dr. Triebenbacher is standing, second from the left.

member Third Degree of the Knights of Columbus, and a member of the board of directors of the St. Francis Center, in Brant Beach.

One of his main loves was his profession. George was proud to be a family physician. He was a diplomate of the American Board of Family Practice, a fellow of the American Academy of Family Physicians, a past-president of the New Jersey Academy of Family Physicians, and an alternate delegate to the national body. He was a national board member of the Family Health Foundation of America and was instrumental in establishing the New Jersey division of that organization.

Continuing education found a champion in George Triebenbacher. As clinical assistant professor of the UMDNJ-Robert Wood Johnson Medical School, he served in the Department of Family Medicine; he was a role model and mentor for medical students.

His educational involvement made him an active part of the Academy of Medicine of New Jersey. He served as secretary and was second vice-president at the time of his death.

In the Ocean County Medical Society, George Triebenbacher was an outstanding leader, having held the various chairs of office and was on its Board of Trustees. The natural progression was to be elected to the Board of the Medical Society of New Jersey and to the American Medical Association House of Delegates.

Not only medical politics, but legislative activities in general intrigued him. He loved a "good fight." Secretary to the JEMPAC board put him into the decision-making arena.

In the 58 years of his life, George Lewis Triebenbacher touched many people. He has been called the consummate volunteer, performing each task with the touch of excellence. A man of vision and action, George has gifted us all with his life.

Dr. George Triebenbacher

No one can replace him. He is and will be missed by those of us who depended on his wisdom, advice, and charm. How fortunate we are to have known him and to have shared his life!

May he enjoy eternal peace!

Limbitrol® (N) Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.

Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Use in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, dizziness, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.

Adverse reactions not reported with Limbitrol but reported with one or both components or closely related drugs: **Cardiovascular:** Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke. **Psychiatric:** Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. **Neurologic:** Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns. **Anticholinergic:** Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. **Allergic:** Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus. **Hematologic:** Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. **Gastrointestinal:** Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue. **Endocrine:** Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. **Other:** Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

PROTEIN DEFICIENCY IN THREE GENERATIONS OF ONE FAMILY

N. PETER ZAUBER, M.D., AND ALEXANDER B. KUDRYK, M.D., LIVINGSTON*

Six members from one family were found to have low levels of protein C. Affected individuals spanned three generations. In this family, age appeared to be a major determinant for the development of symptoms.

Clotting is a complex protein system, resulting in a fibrin meshwork, which can be initiated and maintained by numerous stimuli. Regulating influences, therefore, are necessary to avoid uncontrolled and excessive clotting. Protein C, a vitamin K-dependent plasma protein that functions as a circulating anticoagulant, is one such regulator. In its active form, protein C inhibits activated factors V and VIII.^{1,2} Additionally, protein C may facilitate fibrinolysis by neutralizing a plasma inhibitor of tissue plasminogen activator, thereby facilitating the fibrinolytic action of plasmin (Figure 1).³ Two other recognized regulators are protein S, a cofactor for protein C, and anti-thrombin III, which inactivates thrombin and, to a lesser extent, several other clotting factors.

Clinical evidence for protein C involvement in the regulation of coagulation comes from the observation that blood levels of protein C reduced to just one-half of normal increase the risk of clinically significant thrombosis. Transmission of hereditary protein C deficiency appears to be autosomal dominant in the few families studied. Family members affected as heterozygotes typically present with thrombotic disease in their second to fourth decades. We report six members of one family, from three generations, with low protein C levels.

PATIENTS AND METHODS

Family Report. The proband (III-2 in Figure 2) is a 50-year-old male born in Cuba of Greek and Spanish lineage who developed thrombosis of his left femoral artery following a myelogram at age 44 years. He responded well to warfarin (Coumadin®) anticoagulation. At age 45 years, a cholecystectomy was complicated by right leg phlebitis and a pulmonary embolus. However, this time warfarin administration resulted in "coumarin necrosis" of numerous soft tissue sites. The diagnosis of protein C deficiency was established three years later during evaluation for claudication. Warfarin anticoagulation was initiated successfully and has been maintained continuously.⁴

The proband's paternal grandmother (I-1 in Figure 2) died at the age of 98 years and was said to have suffered from bouts of phlebitis. The proband's father, who is 74 years old (II-2 in Figure 2), and his aunt, who is 71 years old (II-6 in Figure 2), have experienced recurrent deep venous thromboses and pulmonary emboli during the last 10 years. They cur-

*Propositus

rently are receiving oral anticoagulation. The propositus' first cousin (III-5 in Figure 2), 39 years old, and his fraternal twin children (IV-1,2 in Figure 2), aged 21 years, have not yet had problems with thrombotic disease.

Protein C Measurements. Plasma samples were obtained from the propositus and from an additional 13 members of his family when they were not taking oral anticoagulants. Venous blood was drawn into 3.8 percent sodium citrate and 0.1 mol/L epsilon aminocaproic acid, 1 part anticoagulant to 9 parts blood. Plasma was separated immediately and stored at -70°C. Protein C was measured by electroimmunoassay using a goat antihuman protein C obtained from American Diagnostics in Greenwich, Connecticut. Assays were performed in the laboratory of Dr. M. Karpatkin, in New York. The levels were expressed as a percentage of pooled normal adult plasma corrected for anticoagulant dilution.⁵ All assays with protein C antigen levels less than 50 percent of control were repeated for verification.

RESULTS

Eight of the 14 family members tested had normal protein C antigen levels ranging between 76 percent and 104 percent and no history of increased throm-

botic tendency. The remaining 6 family members had protein C antigen levels between 20 percent and 45 percent. The propositus' level was 45 percent. His father's level was 32 percent and his aunt's level was 35 percent. The levels of the younger, asymptomatic members were: 25 percent in the propositus' cousin, and 20 percent and 34 percent in his affected twin children (Table).

DISCUSSION

Our data confirm earlier results that reduction of protein C levels to less than one half of normal is associated with a high risk of venous thrombosis, and is on an inherited basis.⁶

The overall prevalence of heterozygous protein C deficiency in nonselected populations has been reported as high as 1 person in 200 to 300 persons.⁷ Yet, these authors claim that the incidence of thromboembolic events associated with protein C deficiency is low. This discrepancy may result from unidentified heterozygotes as well as from the later age of onset of thrombotic problems in some deficient patients.

Protein C deficiency may present clinically as one or more of a variety of conditions, including superficial phlebitis, deep venous thrombosis, arterial thrombosis, pulmonary embolism, and cerebrovascular acci-

Figure 1—Role of protein C in coagulation; activation —→; inhibition —//→.

Figure 2—Pedigree of family with protein C deficiency. → denotes the proband, squares represent males, circles represent females, empty symbols represent individuals not studied, symbols with dots represent individuals with normal protein C levels, and blackened symbols are heterozygote deficiencies.

dent.^{8,9} A unique presentation of protein C deficiency is "warfarin skin necrosis" in which local thrombosis of venules occurs secondary to a further decrease in fibrinolysis during initiation of warfarin therapy.¹⁰

Age appeared to be a more important determinant for the development of symptoms than the actual protein C level for our study family. The affected individuals under the age of 40 years at the time of study had been totally asymptomatic, despite having lower levels of protein C than the symptomatic, older individuals.

Several family studies have revealed the mean age of onset of thrombosis to be less than 30 years.^{6,11,12,13} However, other studies reported three families with 13 protein C deficient individuals in whom the mean age of onset of thrombotic problems was 48 years.^{7,14} As with our proband, tissue injury may be a particularly important trigger factor for the development of thrombosis.

Our tests revealed 6 affected individuals out of 14 individuals studied. If, by history, individual I-1 is considered deficient and if individuals II-1 and II-4 are considered normal, then there are 7 affected individuals out of a possible 17, or 41 percent. This is close to the 50 percent incidence expected with an autosomal dominant inheritance pattern. Similar percentages have been reported by others.^{11,12}

Our data reveal an equal sex ratio, with three males and three females having low levels of protein C. Others also have reported an equal sex distribution. Of 96 patients with protein C deficiency identified by sex in 31 families, the male:female ratio was 1.1:1.^{6,7,11,13,14}

A deficiency of one of the regulatory proteins of clotting, protein C, protein S, or anti-thrombin III, should be considered in any patient experiencing a significant

or unprovoked major thrombosis. Similar thought should be given to any young patient with even a minor thrombosis. In particular, protein C deficiency should be considered in any patient experiencing warfarin necrosis.

We believe the development of a first thrombosis in protein C deficient patients is justification for the initiation of life-long oral anticoagulation. Identification of symptomatic protein C deficient patients and use of anticoagulation should reduce their subsequent morbidity and mortality from thrombotic disease. It also will allow for screening of family members and for genetic counseling.

There are no clear guidelines for anticoagulation of asymptomatic heterozygotes. We do not recommend such therapy until the first thrombotic event, to avoid potential toxicity associated with years of unnecessary anticoagulation. However, this approach must be balanced against the morbidity and possible mortality of a major thrombosis.

**“A fee-for-service insurance program
with complete office coverage?”**

**I don't
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

When you asked for a fee-for-service insurance program with comprehensive medical coverage, we listened. Because we all share a common concern, the welfare of your patient.

And when you told us fee-for-service had to cover all your in-office claims, we heard you.

Together we've developed Medallion, the best insurance for a healthy practice—and your patients.

Comprehensive fee-for-service.

The insurance program you want with the comprehensive medical coverage your patients need, including office visits, well child care and unlimited laboratory and X-ray services. Just bill your usual charges for each and every service you perform.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

® Registered Marks Blue Cross and Blue Shield Association ® Registered Mark Blue Cross and Blue Shield of New Jersey, Inc.

We'll put your patients up on a pedestal.

The Stone Center of New Jersey, the leader nationwide in lithotripsy advancement, is the premier center in the country to offer the bath-free Dornier HM-4 lithotripter.

At the Stone Center your patients rest comfortably on a water filled cushion... utilizing the most advanced lithotripsy technology available. Because they are not submerged in a tub, the procedure is less stressful and easier to perform.

Your patients are treated in a sophisticated atmosphere by the state's top lithotripsy professionals. From our convenient

valet parking to our helpful and efficient patient representative who will schedule your cases... you'll rate our service second to none.

So contact Arlyn Rayfield, Executive Director, today and schedule an appointment for machine demonstrations or to receive additional information on ESWL[®] treatment.

Because your patients deserve to be put up on a pedestal.

The Stone Center of New Jersey. For the new wave in kidney stone treatment.

HYPERPARATHYROIDISM MASQUERADING AS HYPEREMESIS GRAVIDARUM

DANIEL C. BUDD, M.D., MARIA MARTA E. KUMKA, M.D., ABHAY K. SUDA, M.D.,
DAVID L. FINK, M.D., PATERSON*

Vomiting is a forgotten manifestation of primary hyperparathyroidism. During pregnancy, this condition clinically can be indistinguishable from hyperemesis gravidarum and should be considered in patients where the vomiting atypically persists past the first trimester.

During pregnancy, diseases associated with pernicious vomiting as the primary symptom may be difficult to distinguish from hyperemesis gravidarum. A patient who had intractable hyperemesis gravidarum was found to have hypercalcemia, suggesting primary hyperparathyroidism as the true underlying cause of her vomiting. Because hyperparathyroidism during pregnancy is associated with significant risk of fetal loss and neonatal and maternal morbidity, its recognition is critical.

CASE REPORT

A 34-year-old Hispanic woman, gravida 1, para 0-0-0, at 11 weeks' gestation was admitted for severe nausea and vomiting for 36 hours prior to admission. She was unable to hold down liquids and complained of extreme tiredness and lethargy. She stood five feet tall and weighed 98 pounds (normal weight, 100 pounds); she lost 3 pounds since her prenatal office visit two weeks earlier. Appearing sick, weak, and dehydrated, the patient was admitted for intravenous hydration and nutritional assessment. Laboratory studies revealed: Hgb 12.9 g/dl, Hct 38.1 percent, sodium 135 meq/l, potassium 2.9 meq/l, chloride 107 meq/l, bicarbonate 26.5 meq/l, calcium 14.3 mg percent (8.5-10.2 mg percent), and phosphorus 1.4 mg percent (2.3-4.7 mg percent). These values represented the first

chemistries drawn since the patient became pregnant. A sonogram to exclude a hydatidiform molar pregnancy confirmed a single intrauterine fetus of 11.1 weeks' gestation. She responded promptly to hydration, antiemetics, and bedrest; she was discharged after six days without further evaluation of her hypercalcemia.

She was readmitted one week later with severe nausea and vomiting, dehydration, and a three-pound weight loss. The previous therapeutic management was instituted, but she continued to vomit and lose weight. Further studies revealed: serum calcium 15.9 mg percent, urine calcium 581 mg/24 hours (50 to 150 mg/24 hours), C-terminal parathyroid hormone 1.9 ng/ml (less than 0.6 ng/ml), 25-hydroxy vitamin D 33 ng/ml (15 to 60 ng/ml), and magnesium 1.4 mg/dl (1.8 to 2.4 mg/dl). Thyroid, gastrin, and cortisol assays were normal. Intravenous hyperalimentation was begun; magnesium was added to the solution after calcium levels were normalized.

A diagnosis of primary hyperparathyroidism was made. Saline diuresis with furosemide was instituted,

lowering the calcium to 10.2 mg percent. At 17 weeks' gestation, the patient underwent neck exploration with removal of a 2.5 cm x 2.0 cm right inferior parathyroid adenoma. The postoperative course was uncomplicated; at discharge, her serum calcium was 8.5 mg percent. The hyperemesis abated by week 20 and the patient gained 30 pounds during the remainder of her pregnancy.

At 37 weeks, the patient delivered vaginally a healthy male infant weighing 6 pounds 10 ounces with an Apgar score of 9 at birth and of 10 at five minutes. The newborn's serum calcium was 10.1 mg percent; the patient's calcium was 8.4 mg percent.

DISCUSSION

"Nausea and vomiting of pregnancy" generally is restricted to a mild disorder during early pregnancy characterized especially by morning nausea and sometimes by vomiting. Although the nausea and vomiting may be quite distressing and persist throughout the day, the patient does not develop fluid and electrolyte derangements. Treatment consists of reassurance that the condition is temporary, and an antiemetic drug without teratogenic potential can be prescribed.

Hyperemesis gravidarum or pernicious vomiting of pregnancy causes individuals to develop nutritional deficiency or fluid and electrolyte disturbances from intractable vomiting in early pregnancy. As in the milder cases, the onset of symptoms tends to be soon after the first missed menstrual period and almost always before the fifth month of gestation. Classically, the vomiting disappears during the third month and rarely persists into the fourth month, although Guze reported 60 percent of his patients had vomited during more than half of the pregnancy.¹ The reported incidence of hyperemesis gravidarum varies considerably; the average is 3.5 per 1,000 deliveries.

A pregnant woman also is susceptible to the same causes of nausea and vomiting as a nonpregnant person. The vast majority of patients, however, who have nausea and vomiting between the weeks 6 and 16 of pregnancy have no demonstrable structural lesion of the gastrointestinal tract. The diagnosis of nausea and vomiting of pregnancy or hyperemesis gravidarum cannot be assumed without consideration of alternative gastrointestinal disorders associated with vomiting. Fortunately, for ease of diagnosis, most such disorders as gastroesophageal reflux, peptic ulcer, biliary colic, pancreatitis, and bowel obstruction are accompanied by pain and usually are quite easy to exclude. The possibility of drug-induced nausea or hyperthyroidism must be excluded as well.

Primary hyperparathyroidism is uncommon and the actual incidence is unknown, but the incidence in all women of childbearing age (approximately eight new cases per 100,000 population per year) suggests that hyperparathyroidism in pregnancy is more frequent than the literature would indicate.

The first case was described by Friedrichsen in 1938, and this is the 80th reported case.² The discrepancy between expected and observed suggests that hyperparathyroidism may be a relatively benign complication of gestation which is unappreciated because of the infrequent determinations of serum calcium in otherwise uneventful pregnancies and the suppres-

sion of calcium levels, both total and ionic, into the lower limits of normal range by pregnancy, thereby masking mild hyperparathyroidism.

The diagnosis of primary hyperparathyroidism during pregnancy usually has been made postpartum after the appearance of neonatal tetany. The condition is associated with severe fetal complications, including spontaneous abortion, stillbirth, and prematurity; it is important that the diagnosis be considered when the mother experiences renal colic, peptic ulcer, pancreatitis, bone pain, or hyperemesis despite calcium levels that may be in the normal range.

In 1962, Ludwig found a 49 percent incidence of complications in 39 pregnant women who had hyperparathyroidism with spontaneous abortion, stillbirth, and neonatal death occurring in 31 percent and neonatal tetany in 18 percent.³ Shangold's review in 1982 documented a 46 percent perinatal and 45 percent neonatal complication rate in cases of maternal hyperparathyroidism.⁴ Perinatal mortality has decreased to a rate of 2 percent as a result of improved diagnostic and therapeutic modalities.

In considering the pathogenesis of neonatal tetany associated with maternal hyperparathyroidism, one must first understand normal serum calcium dynamics during pregnancy. As early as the second trimester, adjustments in maternal calcium metabolism result in enhanced gastrointestinal absorption and increased total body accretion of calcium.⁵ This reserve facilitates transporting to the fetus approximately 25 to 30 gm of calcium by term for skeletal mineralization. The first event noted in the second trimester is a physiologic decrease in serum albumin resulting in a progressive decrease of serum ionic calcium to the lower normal range, where it remains until term. The fall in ionized calcium is followed by a rise in parathyroid hormone levels by week 21 to 24.⁶ This has been considered as physiologic hyperparathyroidism of pregnancy with hormone assays twice normal noted at term. The 25-hydroxy-vitamin D levels decrease and 1,25-dihydroxy vitamin D ($1,25(\text{OH})_2\text{D}$) levels start increasing in the first trimester when parathyroid hormone levels generally are depressed.⁷ The 25-hydroxy vitamin D is converted into $1,25(\text{OH})_2\text{D}$ by the enzyme 1,25-dihydroxylase. It is suggested that the increased activity of 25-hydroxy vitamin D₁ alpha hydroxylase may be due to a combination of estrogen and progesterone with a possible role of human placental lactogen.⁸

Ertel et al. demonstrated that neonatal tetany occasionally is accompanied by fetal hypomagnesemia in addition to hypocalcemia.⁹ Hypomagnesemia in the fetus results from maternal hypomagnesemia; magnesium deficiency is known to inhibit both synthesis and release of parathyroid hormone, even in the face of hypocalcemia. Elevated calcitonin levels provide protection to the mother's skeleton from the adverse effects of elevated parathyroid hormone levels and 1,25-dihydroxy vitamin D levels.

The calcium regulation of the fetus is determined by active placental transport mediated by the calcium ATPase system. Vitamin D and its metabolites cross the placenta but have little role in fetal calcium metabolism; maternal parathyroid hormone does not cross the placenta. Parathyroid hormone levels almost

are undetectable at term in the cord blood. The parathyroid gland of the fetus has the capacity to function as early as week 12 or 13. During pregnancy, calcium ion freely crosses the placenta from the maternal to fetal circulation. A relative mild elevation of calcium levels in the fetus plays a role in the suppression of the fetal parathyroid gland. However, this suppression may be more marked in the case of maternal hypercalcemia. Because of this, the neonate at birth may have difficulty mobilizing the calcium stores from its bones, resulting in tetany. Usually, the infant can be managed successfully by supplemental calcium, dietary phosphate restriction, and vitamin D. If neuro-irritability persists despite normalization of calcium levels, the replacement of magnesium along with restriction of milk containing high phosphates should be considered.

Some women with primary hyperparathyroidism have no symptoms during pregnancy; pregnancy produced a progressive decrease in serum total and ionized calcium throughout gestation. Others with mild symptomatic hypercalcemia can be controlled with oral phosphate therapy. Hyperparathyroid (hypercalcemic) crisis can occur when the serum calcium is elevated to 15 to 20 mg/dl and is associated with an acute and rapidly progressive clinical deterioration characterized by muscle weakness, fatigue, nausea and vomiting, anorexia, weight loss, dehydration, drowsiness, and confusion that may progress to coma and death. Such significant hypercalcemia can be controlled before surgery with saline diuresis with a calciuretic diuretic. Hypercalcemia that is resistant to diuretic therapy may be alleviated by more potent agents such as calcitonin and careful patient monitoring followed by parathyroidectomy on an urgent, individual basis.

Medical management should be used only for short-term control of hypercalcemia and not as long-term therapy. The pregnant patient with primary hyperparathyroidism should be treated surgically. The operation should be carried out after week 16 of gestation when fetal organ systems are developed. In the last trimester, the potential for premature labor becomes

progressively greater with approaching term. Thus, the optimal time to perform the neck exploration is the second trimester. To date, there have been no maternal deaths among patients who underwent parathyroid surgery during pregnancy. This patient represents the 27th reported case of parathyroidectomy during pregnancy since the first reported by Petit and Clark in 1947.¹⁰⁻¹⁵

COMBINED PERCUTANEOUS AORTIC VALVULOPLASTY AND PERCUTANEOUS CORONARY ANGIOPLASTY

JACOB I. HAFT, M.D., JONATHAN E. GOLDSTEIN, M.D., JOHN A. ALTIERI, M.D.,
ARNOLD SCHONMULLER, M.D., NEWARK*

Significant aortic stenosis and single-vessel coronary disease were treated successfully without surgery in a patient with very poor left ventricular function. Percutaneous transluminal coronary angioplasty and balloon valvuloplasty provide another nonsurgical avenue for treating high-risk cardiac patients.

Balloon valvuloplasty of the aortic valve in the elderly has become a feasible and acceptably safe procedure.¹⁻⁴ Balloon angioplasty of critical coronary artery stenosis is effectively performed in patients more than 65 years old.⁴⁻⁶ Because the risk of combination coronary artery bypass surgery with aortic valve replacement is estimated at 13.5 percent⁷ and increases to approximately 17 percent in elderly patients,^{7,8} attention has been directed towards avoiding cardiac surgery by performing aortic valvuloplasty and percutaneous transluminal coronary angioplasty (PTCA) in the same patient.^{9,10} We describe the first combination of these procedures in New Jersey.

CASE REPORT

A 67-year-old white man had a one-year history of increasing angina, and dyspnea on exertion. He had orthopnea for the previous five weeks. The history included a possible attack of acute rheumatic fever as a child and rejection by the army in 1942 because of a heart murmur. Physically active all of his life, the patient had worked as a mail carrier. Cardiac catheterization was performed at another hospital in 1973. He was told his "arteries were open" and that he had aortic stenosis which did not require surgery at that time. There was no history of palpitations, light-headedness, or syncope.

The patient was a well-developed, well-nourished male with blood pressure 160/70 and pulse of 76/minute and regular. The carotid upstroke was diminished. Examination of the heart revealed the point of maximal impulse to be displaced 2 cm to the left of the midclavicular line, a 3/6 holosystolic murmur at the apex, a 3/6 harsh systolic ejection murmur at the base that radiated to the carotids, and a 2/6 diastolic murmur along the left sternal border. The aortic second sound was decreased in intensity; no opening snap was heard. Electrocardiogram showed normal sinus rhythm with complete left bundle branch block; chest x-ray confirmed cardiomegaly. Echocardiogram revealed a dilated diffusely hypokinetic left ventricle with a markedly thickened trileaflet aortic valve and a minimally thickened mitral valve with no evidence of mitral stenosis. Doppler study demonstrated a 60 mmHg gradient across the aortic valve, mild aortic insufficiency, and mild mitral regurgitation.

On cardiac catheterization performed via cutdown in the right brachial artery and an antecubital vein, the patient had marked pulmonary hypertension

*Drs. Haft, Goldstein, Altieri, and Schonmuller are affiliated with the Department of Cardiology, St. Michael's Medical Center, Newark. Correspondence may be addressed to Dr. Haft, St. Michael's Medical Center, 268 Martin Luther King Jr., Blvd, Newark, NJ 07102.

Figure 1—The 20-mm diameter aortic valvuloplasty balloon has been fully inflated within the stenotic valve. There is a Swan-Ganz catheter with a pacing wire in position. Note the balloon guidewire within the left ventricle (posterior-anterior projection).

Figure 2—Coronary arteriogram of the right coronary artery (left anterior oblique projection). Note the high-grade narrowing in the proximal area.

(PA = 64/32 (44)), no gradient across the mitral valve, an aortic gradient of 34.5 mmHg, left ventricular end diastolic pressure (LVEDP) of 36 mmHg, and cardiac output of 3.3 liters/minute. The aortic valve area was calculated to be 0.5 cm². Left ventriculography revealed mild mitral regurgitation, and generalized severe hypokinetic contraction with an ejection fraction of 21 percent. There was one to two plus aortic insufficiency through a calcified aortic valve found on aortic root injection. Selective coronary arteriography demonstrated two areas of 90 percent stenosis in the proximal third of the right coronary artery (RCA) and intraluminal abnormalities with no hemodynamically significant stenosis in the left anterior descending (LAD) and the left circumflex (LCF) coronary arteries.

Because of the expected high risk of surgical aortic valve replacement and coronary bypass grafting in this patient with a severely dysfunctional left ventricle and pulmonary hypertension, we recommended aortic valvuloplasty combined with PTCA. It was decided that valvuloplasty should be performed first.

The patient was brought to the catheterization suite on January 5, 1988, and both femoral artery areas were prepared for catheter entry. A 5F cannula was placed in the left femoral artery and an 8F cannula was placed in the left femoral vein. A 7F Swan-Ganz pacing catheter was advanced through the left femoral vein into the pulmonary artery and pressures were recorded. A cutdown was performed over the right femoral artery and a 12F sheath was placed in the exposed right common femoral artery. Through this sheath, a Jud-

kins R-4 catheter was advanced to the aortic valve. With the aid of a straight flexible guidewire, the Judkins R-4 catheter was brought through the aortic valve and into the left ventricle. Upon removing the guidewire, left ventricular pressure was 168/30 and femoral artery pressure was 136/70, yielding a mean aortic gradient (by planimeter) of 39.4 mmHg at rest. Multiple thermodilution cardiac outputs were performed immediately and averaged 3.26 liters/minute; the functional aortic valve orifice area at rest was calculated to be 0.53 cm².

A 260-cm long exchange wire with a double-coiled flexible distal tip was brought through the Judkins R-4 catheter; the Judkins catheter was removed. A 20-mm balloon dilatation catheter was brought over the exchange wire through the femoral sheath, advanced through the aorta, and placed across the aortic valve. Four inflations using dilute contrast medium were performed (Figure 1). Each inflation was maintained at a pressure of two and one-half to three atmospheres for 30 to 55 seconds. During balloon inflation ventricular ectopy occurred, and systemic arterial pressure fell transiently to a mean of 40 to 50 mmHg. After completion of the four inflations, the balloon was withdrawn over the exchange wire and a pigtail catheter was brought over the exchange wire and placed in the left ventricle; the exchange wire then was removed entirely. Left ventricular pressure following angioplasty was 160/30 and systemic pressure simultaneously measured in the left femoral artery was 132/72. Planimetric measurement of the gradient was 31.3 mmHg following valvuloplasty. Multiple thermodilution cardiac outputs again were performed averaging 3.74 liters/minute. Utilizing the Gorlin equation, the functional orifice area following balloon valvuloplasty was calculated to be 0.74 cm². The gradient was confirmed by catheter pullback, and the entire catheter system was removed from the right femoral artery. The arterial puncture was repaired surgically and the skin incision was closed by the thoracic surgeon who was in attendance throughout the procedure.

The patient was on heparin with catheters maintained in the left femoral vein and artery in the coronary care unit. Two days later, he returned to the catheter laboratory for angioplasty of the right coronary artery. After administering 10,000 units of heparin, the left femoral artery indwelling cannula was replaced with an FR-4 guiding catheter, using an exchange wire; it was maneuvered into the right coronary ostium. A 2.5 mm low profile steerable (LPS) short balloon was brought across the proximal severe stenosis in the right coronary artery. Three inflations to ten atmospheres were performed, with each inflation lasting from 40 to 50 seconds. The balloon was advanced to the second stenosis and two inflations were performed to six atmospheres. The angioplasty balloon was withdrawn and repeat arteriography was performed through the guiding catheter in the right coronary artery. Repeat arteriography demonstrated near-complete resolution of both of the discrete proximal stenoses in the right coronary artery (Figures 2, 3, and 4). The left ventricle (LV) was entered and on pullback, the mean aortic valve gradient was 19 mmHg. The guiding catheter was removed and the patient returned to the coronary care unit for observation on

Figure 3—Coronary arteriogram following successful angioplasty of the right coronary artery.

intravenous heparin. The next day after stopping the heparin infusion, the Swan-Ganz catheter and indwelling 8-French femoral arterial lines were removed. The patient tolerated the procedures without problems. During the remainder of his hospitalization, the patient was free of angina, his orthopnea resolved, and he experienced no dyspnea on ambulation. He has remained asymptomatic.

DISCUSSION

Until recently, the only effective therapy for aortic valvular stenosis in the adult had been surgical aortic valve replacement. In 1986, Cribier et al. demonstrated that critically stenotic aortic valves could be opened without thoracotomy using percutaneous balloon dilatation of the valve.¹² The success of this procedure, even in heavily calcified valves, has been confirmed repeatedly over the past two years.¹⁻⁴ The interventional therapy of choice for single-vessel coronary artery occlusive disease has become percutaneous transluminal angioplasty.^{5,6} Because valvuloplasty still is a new procedure and long-term followup may demonstrate a significant number of patients in whom aortic stenosis recurs,¹³ the procedure has been reserved for elderly patients who are very poor candidates for surgery, and symptomatic patients who adamantly refuse surgery. This patient was severely symptomatic and many of the findings that increase the risk of aortic valve surgery were present: a dilated, dysfunctional, failing left ventricle,⁷ pulmonary hypertension,⁷ and associated coronary artery disease.⁸ The patient's coronary lesion was optimum for PTCA, and we felt that valvuloplasty would be tolerated better by his dilated ventricle than would open heart surgery.

Combination PTCA and aortic valvuloplasty has been reported in 13 patients. Hamad and colleagues successfully performed aortic valvuloplasty and right coronary angioplasty on three patients, and valvuloplasty and LAD PTCA on one patient.¹⁰ McKay et al. reported nine patients who had the combination therapy.⁹ PTCA with associated aortic valvuloplasty was performed in three LAD, three LCF, two RCA, and one graft to the RCA. Hamad did PTCA as the first procedure in patients because he felt reducing the hypoxic insult during the stress of valvuloplasty would be beneficial. McKay also did PTCA first in 8 of the patients; two procedures were performed on one visit to the catheter laboratory because of technical considerations, and valvuloplasty was performed first in the patient who had staged procedures.

We chose to perform combination valvuloplasty and PTCA rather than surgery in our patient primarily

Figure 4—Aortogram in the left anterior oblique progression performed after valvuloplasty and after coronary angioplasty demonstrating one plus aortic insufficiency.

because of the very poor LV function. We reasoned that if he had acute closure of the coronary as a result of PTCA (crashed) and he still had severe aortic stenosis, this further insult to his already weakened LV would make his chances of survival very much compromised. Alternatively, we felt that he would tolerate, without major difficulty, the less than 60 second episodes of severe LV outflow obstruction that occur during aortic valvuloplasty, even in the presence of the severe right coronary lesion. Hence, we elected to perform valvuloplasty first and follow it with PTCA.

Addendum: Another patient successfully underwent combined aortic valvuloplasty and PTCA. Thus, 5.1 percent (2/39) of the aortic valvuloplasties performed at St. Michael's Medical Center have been combination procedures.

TEN-YEAR EXPERIENCE IN OTOLARYNGOLOGY MEDICAL MALPRACTICE CLAIMS IN NEW JERSEY

HARVEY P. YEAGER, M.D., AND SUZANNE L. KUEHM, M.P.H., LAWRENCEVILLE*

Educating patients to have realistic expectations of procedural outcomes and to communicate effectively with patients, especially when a negative result occurs, appear to lower the risk of a medical malpractice suit. By listening to patients, many suits, particularly those involving diagnosis errors, could be avoided.

The United States General Accounting Office Report published in 1987 states that "the best way to deal with medical malpractice is to prevent its happening." While it is too ideological to suggest that all medical malpractice suits can be prevented, an awareness of specialty-specific trends can be the first step for the physician in developing a personal risk prevention plan to reduce professional liability.

The risk prevention department of the Medical Inter-Insurance Exchange of New Jersey (MIENJ), a physician-owned carrier, was established on February 1, 1983, by its Board of Governors. One of the objectives of the department is to decrease patient injury and reduce medical malpractice claims and their impact upon the physician—emotional, professional, and financial. A system was developed to analyze all claim files to identify trends to facilitate risk prevention activities. These files were divided into surgical, non-surgical, and anesthesia categories, then subdivided into specialty categories. The department analyzes and codes all cases based on problem areas identified by the peer review process.

The peer reviewer is of the same medical specialty as the physician involved in the lawsuit. The peer reviewer is responsible for educating the medical liability representative and the lawyer as to the medical problem. The majority of the cases reported here have been

determined indefensible by peer review or by the defendant physician. There also was a small number of cases that resulted in verdicts for the plaintiff.

The data used in this paper is based on the claim experience of otolaryngologists (Table 1) insured from February 1977 through February 1987 (Table 2). The number of otolaryngologists that were insured during these ten years averages 99 physicians per year.

The first phase of the review includes cases closed with payment to the claimant. We have considered that actual medical misadventures occurred in these claims.

CASES CLOSED WITH PAYMENT

All cases closed with payment since the inception of MIENJ were analyzed. There were 79 cases closed with a total indemnity payment of \$5,335,257.68. Payments ranged from \$32 to \$630,000. The average indemnity paid was \$67,534.90. The expense incurred in the defense of these cases was \$335,432.73, an average of

*Dr. Yeager is a practicing otolaryngologist in West Orange, and is a member of the Board of Governors, Medical Inter-Insurance Exchange of New Jersey (MIENJ) and chairman, Committee for Professional Liability, American Academy of Otolaryngology-Head and Neck Surgery. Ms. Kuehm is a loss analyst, Risk Prevention Department, MIENJ. Correspondence may be addressed to Dr. Yeager, MIENJ, Two Princess Road, Lawrenceville, NJ 08648.

\$4,245.98. Only 15 insureds had two or more cases, 5 insureds had three or more cases, and only 1 insured had more than four cases. This doctor no longer is insured by MIENJ. During the same time period, there were 188 cases closed without indemnity payment. There were 40 open files.

ERRORS IN DIAGNOSIS

There were ten cases with a total of \$1,437,178.00 paid to the claimant. Of these ten cases, there were two cases of delayed diagnoses of cancer of the larynx (9 and 18 months delay). The patients were 52 and 63 years old, respectively. There was one case with a two-year delay in diagnosis of cancer of the pyriform sinus and larynx in a 48-year-old; one case with a one-year delay in diagnosis of cancer of the parotid gland in a 40-year-old; one case with a 10-month delay in diagnosis of cancer of the pharyngeal wall in a 55-year-old; and one case with a one-year delay in diagnosis of cancer of the tongue in a 47-year-old.

You should listen to what your patients are trying to tell you.

The following case example is a representation of these claims. A 63-year-old male had bilateral benign polyps removed from the true vocal cords. Six months later, the patient returned complaining of hoarseness. Indirect laryngoscopy revealed a white spot on the true vocal cord. "Impression was a return of leukoplasia. The patient was scheduled to return for observation in one month." At this visit (one month later), indirect laryngoscopy revealed the "white spot" still was present. The insured recommended observation in three months. A review of the office records showed symptoms listed on every office visit (weight loss, hoarseness, coughing with blood-tinged sputum production, and sore throat). The patient eventually was seen by a second physician who made the diagnosis of cancer of the larynx and performed a total laryngectomy and bilateral radical dissection. The physician peer reviewer felt that due to the patient's history, the insured should have been more aggressive since he had suspected cancer when he removed the polyp nine months earlier. The reviewer opined that the patient should have been admitted for a direct laryngoscopy.

When you suspect something is not right, do not wait before you act upon your suspicions.

Trends. There were several likenesses found among

the cases involving errors in diagnosis: (1) The patient's symptoms were treated over a period of time without improvement or consideration of another diagnosis. The insureds took a "watch and wait" attitude. There was no re-evaluation. The patient sought treatment from another physician who made the correct diagnosis. (2) There was a failure by the physicians to followup on recommendations of consultants or second opinion otolaryngologists for further diagnostic study. (3) The insureds were lulled into a false sense of security by negative test results and negative physical findings by other specialists, even though there was no improvement in the patient's symptoms.

ERRORS IN PERFORMANCE

Of the 15 cases in this category, 6 cases involved rhinoplasty/septoplasty; 2 cases involved stapedectomy; 2 cases were for nasal polypectomy, ethmoidectomy and arthroscopy; and 1 case involved tracheostomy. There were several issues common to all 15 cases: (1) The operative consent did not advise of the risk of the complication occurring. This especially was important when the patient had a pre-existing condition that placed him at special risk of the complication occurring. For example, a patient had a septoplasty. Following surgery, the patient was noted to have multiple perforations in the septum. This patient was at greater risk of this occurring since he had prior nasal injury with surgical repair. (2) In the cases which involved rhinoplasty, the patients expressed dissatisfaction with the result. One patient made the comment, "He told me I was going to look like Robert Redford." Perhaps more time spent with these patients preoperatively to help them formulate a more realistic expectation of the surgery would prevent this type of claim. (3) In cases involving stapedectomies, the patients alleged that there was a decrease in hearing following surgery. In these cases, the insureds had not performed preoperative audiograms. In both of these cases, the physician recommended re-exploration but the patient refused or postponed the second surgery and later sued the physician for the delay in performing the re-exploration.

Educate the patient to promote realistic expectations of procedural outcomes and of your own abilities.

In one case within this category, the patient's family had requested one surgeon to perform a tracheostomy and had signed an operative consent naming that physician alone. When a partner of the designated surgeon performed the tracheostomy, the family sued the two operating physicians for battery, and sued the requested physician for a deviation from the standard of care.

UNINTENTIONAL IATROGENIC INJURY

In this category there were 13 cases. Eight cases were nerve injuries which accounted for \$1,194,475.00 of the total indemnity for this category (\$1,362,762.00). There were 4 facial nerve injuries as a result of ear surgery; 2 spinal accessory nerve injuries and 1 brachial nerve injury arising from the removal of neck tumors; and 1 third cranial nerve injury from a bilateral Caldwell Luc procedure. Other significant major injuries occurred to blood vessels during sinus

TABLE 2
Ranking of Misadventures
by Percent of Total Indemnity (\$5,451,125.94)

Misadventure	No. of Files	Indemnity Paid	% of Total Indemnity Paid
Error in Diagnosis (failure, delay, or misdiagnosis)	10	\$1,437,178	26.36
Unintentional Iatrogenic Injury (unintentional injuries occurring during the performance of a therapeutic procedure)	13	\$1,362,762	25.00
Decision Error	8	\$1,111,702	20.39
Error in Performance (of a procedure)	15	\$1,028,500	18.87
Legal Issue	1	\$150,000	2.75
Records	4	\$126,499	2.32
Management (relied on assessment of resident)	1	\$99,000	1.82
Communication Breakdown (between patient and doctor)	2	\$39,500	0.72
Error in Medication	3	\$38,999	0.72
Communication Breakdown (between care providers)	1	\$30,000	0.55
Potentially Compensable Event (tooth injuries)	18	\$13,485	0.25
Surgical Foreign Bodies	2	\$11,000	0.20
Consultation/Referral Problems	1	\$2,500	0.05

surgery. It is interesting that there were no nerve injuries arising from surgery to the parotid gland.

There were several lessons to be learned in this category: The patient needs to be counseled thoroughly preoperatively to be made aware of the risks inherent in the procedure. And, when a negative outcome occurs, the manner in which the situation is handled can make a difference in the patient's decision to sue. Listen to the patient and heed the patient's complaints. A delay in diagnosing a cerebral spinal fluid leak or meningitis following nasal polypectomy or sinus surgery, or a delay in diagnosing an invasion of the orbit following sinus surgery, only compounds the initial complication.

Know your surgical instruments and their safety features.

DECISION ERRORS

There were eight files in this category and a total of \$1,111,702 paid in indemnity to claimants. There was no commonality in conditions being treated or in the surgical procedures performed. We note several case reports:

Case Report 1: A 37-year-old obese male was diagnosed as having acute epiglottitis. From the time the patient arrived at the hospital, there was a 30-minute

delay at the information desk, and an additional 30 minutes before the primary physician saw the patient and then wheeled him to the x-ray department. At this time, the primary physician telephoned the otolaryngologist, who requested x-rays of the neck. The otolaryngologist arrived 15 minutes later, and read the x-ray films as indicating severe swelling of the epiglottis, arytenoid cartilages, and probably of the subglottic area as well. He obtained a history of progressively more difficulty in breathing. His examination demonstrated severe inspiratory and expiratory stridor. The larynx could not be examined because the patient could not lift his head from the flexed position. The patient was in the operating room 20 minutes after the insured's examination. There was yet another delay of 15 minutes until the operating room became available and an additional delay until the anesthesiologist arrived. The patient had a respiratory arrest just prior to the tracheotomy being performed by the insured—one hour and 45 minutes after the patient had arrived at the hospital. The patient expired one hour later in the intensive care unit. It was that physician reviewer's opinion that the insured should have called the operating room himself and obtained a backup anesthesiologist, and as the situation became more emergent, a cricotracheotomy should have been performed.

Case Report 2: A 57-year-old woman had a total rhinostomy for an infiltrating squamous cell carcinoma. She was readmitted for reconstructive surgery where the insured connected a deltopectoral skin flap to the nose. The patient was kept immobile postoperatively. On postoperative day 6, an infection was recognized at the chest site, and within the following week the reconstruction effort was considered a failure. The insured admitted that this was the first time he had performed this procedure. The physician reviewer opined that a forehead flap should have been used instead of the chest flap.

Case Report 3: A 30-year-old male complaining of a choking sensation was diagnosed as having an elongated uvula. The insured removed the elongated uvula, and the patient suffered from excessive bleeding necessitating a second admission for blood transfusions containing factor VIII. The patient was a known hemophiliac. The peer reviewer advised that the inflamed uvula was not life threatening, and knowing that the patient was a hemophiliac, the insured should have treated the patient conservatively.

Do not be reluctant to ask for a second opinion, especially if the patient is not improving or if there has been a surgical complication.

Trends. In each of the eight cases in this category, there appears to be one common thread. While it may be easy to say in retrospect that a decision was not the best for the patient, in each of the previous examples where an atypical problem was identified, "a second thought" before instituting treatment may have resulted in an alternate treatment and avoidance of these negative outcomes. Perhaps a second thought, "Is this the right treatment for this patient or for this situation?" might help avoid similar situations. A similar concept is stated in the book, *In Search of Modern Hippocrates*: "I as a physician, shall recommend for each patient only those things I would like to have done for myself or my immediate family under the same circumstances."² (This does not mean to imply that we recommend that the physician actually treat his own family members.)

POTENTIALLY COMPENSABLE EVENT

While there were 18 claims against our insureds for injury to teeth occurring during a procedure, the indemnity paid ranged only from \$32.00 to \$725.00. It is of significance that in most of the cases, it was specifically documented that a tooth protector or a dental guard had been used, but the pressure from the weight of the scope and the manipulation damaged the teeth. Eleven of the 18 procedures that led to the injuries were laryngoscopies, while 5 procedures were tonsillectomies. There was only 1 case each of bronchoscopy and esophagoscopy.

THE REMAINING MISADVENTURES

The remaining 15 files did not produce any trends. We have included several case reports from these files where a breakdown in the treatment environment (office procedures) led to the medical malpractice suit:

Case Report 1. A 22-year-old male's preoperative blood test indicated a bleeding abnormality. The hospital telephoned the insured's office with the test results. **The office staff did not alert the physician. The test**

results were placed into the hospital chart, but the physician did not review the chart before surgery. The surgery was elective and the patient was not acutely ill. Postoperatively, the patient had serious bleeding, was maintained in the intensive care unit, had a lengthy hospitalization, and had several additional hospital admissions for recurrent bleeding. This should emphasize the need for an office system that ensures that information is promptly and accurately relayed directly to the physician.

Case Report 2. Dexamethasone (Decadron®) was prescribed for a 55-year-old female to treat nasal congestion due to an allergy over a period of three years. The physician saw the patient for seven office visits. On three of these office visits, the physician noted in the record that the patient was taking the dexamethasone, and he advised her to stop the medication. The patient alleged in the suit that as a result of taking the dexamethasone, she developed diabetes mellitus and personality changes. (Continuous, prolonged, unmonitored prescription of dexamethasone is a deviation from the standard of care.) The physician's contention was that he had not continued to prescribe the drug and wasn't aware that the patient was still taking the drug. However, there are telephone calls where the insured states he may have ordered dexamethasone with no documentation of the telephone calls or prescription in the office record. **Important decisions and outcomes often are dependent upon information relayed via the telephone through the office staff and answering service. There is a need to carefully record and make these messages a part of the patient's chart.**

Case Report 3. A 37-year-old female was referred for evaluation of a mass of the parotid duct as seen on the x-ray. The otolaryngologist diagnosed a tumor. Upon exploration of the parotid duct, no tumor was found. The patient suffers from numbness of the face and Frey's syndrome. The patient is alleging unnecessary surgery which was improperly performed. Two weeks prior to surgery, Partner A noted in the office record that the patient's face was normal and surgery was not indicated. Partner B disagreed with Partner A and performed surgery. There are two important points to be made: the record should always reflect the physician's thought process. In this example, possibly Partner A changed his opinion and agreed with the need for surgery but failed to document this in the patient's record. Secondly, take care not to be a facilitator of a medical malpractice suit by carelessly worded comments in the patient's record or through casual verbal comments. **A final word in regard to records: frequently a claim could not be defended because the insured had altered the patient's record. Don't be tempted to alter records.**

CONCLUSION

In this paper we have reviewed the ten-year experience in medical malpractice claims closed with payment in the specialty of otolaryngology. MIENJ paid \$5,335,257.68 in indemnity for 79 claims in an insured population that averaged 99 otolaryngologists per year.

Diagnostic errors with decision errors represent \$2,548,880 in losses in 18 suits. Improper perfor-

mance of a procedure with unintentional iatrogenic injuries represents \$2,391,262 in losses in 28 suits. These four misadventure categories represent 46 of the 79 files and 90.62 percent of the total indemnity paid to claimants.

For the purpose of increased patient safety and decreased medical malpractice claims, we recommend consideration of the following points:

1. **Listen to the patient's complaints when making a diagnosis, and listen carefully to complaints following surgery.** This may save you from a delay in diagnosis or a failure to diagnose a condition, and may aid in the timely diagnosis of complications from surgery or unintentional iatrogenic injuries such as a severed optic nerve or meningitis secondary to sinus surgery. We have seen case after case where the physician turned a deaf ear to the patient. Problems could have been avoided just by taking a detailed history or by listening. If the patient is not improving with your treatment, consider "second thoughts" and second opinions to aid in diagnosing the unusual or difficult condition. If there has been a second opinion and there are worthwhile suggestions, carry them out.

2. **Have an ongoing dialogue with your patients to educate them in developing realistic expectations of treatment, of surgical outcomes, and of your own abilities.** This may lessen the chance of being sued for a poor result which in reality was a reasonable risk. Explain to the patient and family the risks of the procedure, and document the discussion in the patient's record. When an unexpected injury does occur as a result of a surgical procedure, be honest and open in your explanation to the patient. Take immediate steps to correct or treat the problem, or refer the patient to the appropriate person or facility where remedial care can be provided. Be supportive to the patient and family in the resolution of the complication.¹

3. **Don't be coerced by the patient into doing a procedure** if you feel you may not be the best person to do the procedure, or if you believe the treatment or procedure is not appropriate.

4. **Document the patient's refusal to comply with recommended treatment.** This should include that the patient was given sufficient information to appreciate the seriousness of the condition, and the risks involved in refusing or delaying treatment in order to make an informed decision.

5. **Do not alter records.** Any addition or deletion made to the patient's record, especially after a bad result or negative outcome, will make the entire record suspect and greatly diminish the defensibility of the physician.

6. **Operate under nonparalytic anesthesia when possible.** There have been several cases of major nerve injury during head and neck surgery that might have been avoided if the patient had not been under paralytic anesthesia.

7. **Recognize that a breakdown in office procedure can be as likely to engender a medical malpractice suit as an improperly performed procedure.** Examples of costly office procedure errors are x-ray reports being filed without the physician seeing them or a telephone message never relayed to the physician.

We hope the experiences of your colleagues will help otolaryngologists develop a personal system of loss prevention.

**“A big insurance company
that’s really listening to me?**

**I don’t
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield

We listened to you because we all share a common concern — the welfare of your patients.

After listening to your needs, we’ve developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you’ll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We’re eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey’s medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate with Blue Cross and Blue Shield.

If you’re not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Call 1-800-842-BLUE for more information. Of course, there’s no obligation.

The best insurance for a healthy practice

STATE OF THE ART: EFFECTIVE PALLIATIVE RADIOTHERAPY AND QUALITY OF LIFE

ANDREW I. ZABLOW, M.D., LIVINGSTON*

Radiation therapy is highly effective in providing symptomatic palliation to patients with metastatic cancer. Irradiation is cost effective, maintains functional status, and provides good quality of life in a percentage of patients.

Cancer is the second highest cause of death in the United States. In 1980, it accounted for approximately 21 percent of all deaths and in 1986, about 25 percent (one out of every four) deaths in America.¹ In 1988, over 900,000 new cancer cases will be reported together with over one half million deaths. The harsh statistics reveal that a child born in 1986 has a greater than one-in-three chance of developing an invasive carcinoma during his lifetime. With better trained oncologists using improved modes of therapy, cancer patients are living longer with productive, quality lives. Fifty percent of all recently diagnosed cancer patients will be alive in five years.

Radiation therapy is an effective therapeutic tool when used to treat patients with incurable metastatic disease (Table). It is utilized to relieve pain, control hemorrhage, and to alleviate obstruction and compression of visceral organs.

BONE METASTASES

Bone metastases frequently are seen in cancer patients. Over half of the patients with breast, prostate, and bronchogenic carcinoma will develop skeletal metastases during the course of their disease; 80 percent of all bone metastases develop from these three primary sites.² Other primary malignancies that will metastasize to bone include thyroid cancer and

cancers of the urologic tract. Multiple myeloma is a primary malignancy in bone marrow.

Patients with osseous involvement will suffer from pain, disability, and, occasionally, pathologic fracture. Pain which often is localized and gradually increasing in intensity, is produced by periosteal destruction or direct tumor pressure. It commonly is associated with weight-bearing bones.

Before initiating therapy, it is important to determine the extent of skeletal involvement. Greater than 50 percent cortical destruction places the patient at high risk for pathologic fracture. When weight-bearing bones are involved, an orthopedic surgical consultation concerning internal fixation is required. This often will prevent fracture, provide pain relief, and keep the patient functional. Radiotherapy (RT) is added to control and prevent further progression of metastases.

For other patients not requiring orthopedic intervention, RT is highly efficacious in alleviating pain. Various published reports have shown long-term pain relief in 73 to 96 percent of patients.^{3,6} Pain relief is often experienced before completion of short course palliative treatment. Within approximately three

*Dr. Zablow is affiliated with the Department of Radiation Oncology, Saint Barnabas Medical Center, Livingston. Correspondence may be addressed to Dr. Zablow, Saint Barnabas Medical Center, Livingston, NJ 07039.

TABLE

Treatment Sites and Response to Radiotherapy

Metastatic Site	Response % with Radiotherapy
Bone	73-96
Brain	70-90
Intrathoracic	80
Liver	55-95
Intrapelvic	75
Spinal Cord	
Compression	35-75
Superior Vena Cava	80-90
Cutaneous	90

months of completion of treatment, recalcification is seen by serial radiographs in many patients. One study reports a 78 percent rate of recalcification.⁵

In selected patients with widespread symptomatic metastases, hemibody irradiation has been used with great success. Single doses of 600 to 800 cGy delivered to the upper, lower, or mid hemibody will provide relief to over 70 percent of patients. Most noted relief within the first 24 to 48 hours.^{7,9} Special pretreatment medications and corrections for lung density will minimize the side effects and make them very tolerable. Relief usually endures for the remainder of the patient's life.

Successful management of osseous metastases is essential to maintaining a good quality of life for the cancer patient. Survival after the diagnosis of metastatic bone disease often is prolonged. For this reason, physicians should be cognizant of the therapeutic and prophylactic values of radiation therapy. Prompt localized irradiation can reduce symptoms, maintain or improve function, and provide a good quality of life.

BRAIN METASTASES

Brain metastases commonly are seen by the radiation oncologist in over 80 percent of patients presenting with multiple brain foci. Lung and breast carcinoma are the most common primary sites. Headaches, seizures, personality changes, and/or other neurologic symptoms are common presentations. Computerized tomography or MRI will delineate the lesions.

Treatment involves a combination of irradiation and steroids. The majority of patients receive whole brain radiotherapy with doses of 30 Gy in two weeks sometimes followed by a boost treatment in three weeks. The median survival for patients with multiple brain metastases is four to six months. Response rates are greater than 80 percent with 60 percent experiencing neurologic improvement for the remainder of their lives.

LIVER METASTASES

In the patient with hepatic metastases, symptoms may include pain, nausea, vomiting, anorexia, jaundice, and ascites. With radiotherapeutic intervention, 55 to 95 percent of patients will experience significant pain relief, reduction in hepatomegaly, and improved liver function studies.¹¹ Fractionated doses of 2100 cGy in two weeks often are used. Median survivals after treatment range from four to six months. This is

slightly improved in patients with untreated disease, but if symptoms are relieved, a great service has been provided. Studies using combination radiotherapy, chemotherapy, and monoclonal antibodies have been encouraging.

INTRATHORACIC METASTASES

Large metastatic nodal masses can cause pain and obstruction. Radiation therapy is used to shrink masses and alleviate or prevent symptoms. Total doses and treatment volumes are determined by the type and extent of the disease.

Esophageal compression and airway obstruction are common problems associated with metastatic disease to the mediastinum and thorax. Palliation of pain and dysphagia have been reported in up to 84 percent of patients treated with a short split course of radiotherapy, which is extremely well tolerated with minimal side effects.¹²

Pleural effusions that have been refractory to other treatment modalities have shown response to radiotherapy. By employing a moving strip technique to the involved hemithorax that delivers 18 to 20 Gy in six fractions over eight days, control rates are approximately 80 percent.¹⁶ This is a short, facile, effective treatment for controlling recurrent malignant effusions.

INTRAPELVIC METASTASES

Patients presenting with advanced local pelvic malignancies, e.g. gynecologic, prostatic, or rectosigmoid carcinomas, may benefit from palliative radiotherapy. Many of the patients present with pain, rectal or vaginal hemorrhage, discharge, and obstruction. Pelvic irradiation can relieve rectal or ureteral obstruction by reducing the size of pelvic masses which are causing extrinsic compression. Vaginal or rectal hemorrhage can be controlled in 75 to 100 percent of the cases. Various fractionation schedules have been used with good success. We have found that a split course utilizing 25 Gy in two weeks and repeated four weeks later will palliate symptoms in almost every patient.

CUTANEOUS METASTASES

Ulcerative, painful skin lesions which often are seen with metastatic carcinoma, readily are controlled with localized radiotherapy. A very high percentage of these lesions respond to treatment with low-energy electrons with minimal epidermal reactions.

ONCOLOGIC EMERGENCIES

Untreated spinal cord compression will cause permanent neurologic damage to the patient. The physician should be alerted to the patient who presents with a combination of gradually increasing pain, weakness, autonomic dysfunction, sensory loss, or ataxia. Pain, by far, is the most common symptom, being present in 90 percent of patients. Ninety-five percent of spinal cord metastases are epidural, most commonly secondary to cancers of the breast, lung or prostate, or lymphomas. Radiation therapy alone, or radiation following laminectomy in certain cases, must be instituted as soon as possible once the diagnosis is made. A high degree of suspicion allows for early diagnosis and improved prognosis. The outcome is

improved markedly in patients presenting with partial compression and minor neurologic dysfunction. As many as 75 percent of patients who are ambulatory at the time of diagnosis of compression will remain ambulatory after treatment. Various fractionation schedules are used with the outcome dependent upon the type of disease and the degree of neurologic dysfunction at presentation.^{13,14}

Superior vena cava syndrome also requires prompt intervention. Patients present with shortness of breath, tachypnea, plethora, thoracic and neck vein distention, pain, cough, and dysphagia. Using a few initial large dose fractions of radiotherapy combined with steroids and followed by standard daily fractionation to a total dose of 30 to 35 Gy will provide improvement in 80 to 90 percent of the patients in 10 to 14 days.¹⁵

SUMMARY

The realistic goals in palliative treatment of cancer patients are to maintain functional status and to provide as good a quality of life as possible. This is achievable through the expertise provided by the treating radiation oncologists using modern computerized treatment planning and highly penetrating x-ray beams. The morbidity of treatment has been reduced markedly. Treatment most often can be given in an outpatient setting. Radiation therapy has proved to be the most cost-effective and humane means of relieving the symptoms of local cancer.

YOCON[®]

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon[®] is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon[®] 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

OPINION: CLINICAL USE OF URINE TESTING IN RELAPSE PREVENTION

WILLIAM J. ANNITTO, M.D., AND CHARLES A. DACKIS, M.D., RANCOCAS*

Urine testing is a major therapeutic tool in preventing and monitoring relapse. Urine monitoring must be clinically tied directly to consequences within the treatment plan. Urine testing should include: strict supervision; high frequency of testing; and patient informed consent to discuss drug-related issues with relevant others.

Treatment for substance abuse implies a commitment on the part of the patient and the clinician. Until this time, the addict has been committed only to acquiring and ingesting drugs. Addicts' initial view of treatment is that clinicians simply are one more hurdle to "get over" so that they may continue to acquire and ingest more drugs. They literally have no notion as to how or why to achieve sobriety. As you know, addicts frequently come into treatment only under extreme duress and generally with multiple medical, psychiatric, legal, or social problems.

How does urine testing fit into the treatment of substance abuse? Urine testing is a very concrete, specific, objective tool in treatment. Interestingly, it serves the needs of the most objective of clinicians and the most subjective of clinicians (Tables 1 and 2). Urine testing serves simultaneously as a rigid indicator of compliance as well as to reinforce in the patient many positive psychological factors that we are trying to encourage. Specifically, it demonstrates to the patient that we have limits, and that we take seriously the true meaning of sobriety, i.e. a clean urine. It demonstrates that we will not and cannot be manipulated by words. However, it also is the entree into their trust on a truly intrapsychic level. They know we realize their cravings are real. We know they have a real disease. In a very physical sense, it tells them that we do care about

them, and that they must behave in a certain way in order for us to treat them in a certain way. Words will have become more than instruments for manipulation. Behaviors will count more than urine screens. The incentive to comply with urine screening is built into an ongoing treatment plan. It clearly and forcefully encourages the treatment goals.

The ultimate goal of drug treatment is sobriety, on the one hand, and an improvement in the quality of life psychologically and psychosocially on the other hand. The patient begins from the point of, "I need to be detoxed and this is what is in my urine," and he achieves a point of, "This is what happened at the office today. These are my feelings, can we talk about them." To get to that point, however, one has to proceed with outpatient treatment in an orderly fashion through the treatment plan, and this creates consequences for the production of a dirty urine (Table 3). The failure to produce a clean urine may mean: 1) inpatient treatment; 2) increased meeting attendance; 3) loss of job; 4) loss of family; 5) loss of licensure; 6) repeat testing with serum and/or a more specific test with, for instance, an enzyme immunoassay or radioimmunoassay. At the least, it will

*Drs. Annitto and Dackis are affiliated with Hampton, a private psychiatric hospital. Correspondence may be addressed to Dr. Annitto, P.O. Box 7000, Rancocas Road, Rancocas, NJ 08073.

mean the clinician has to review the treatment plan with the patient and perhaps with important others. These consequences for failure to produce a clean urine should have been in the treatment plan. They are not foisted upon the patient at the time of the occurrence. For instance, a physician whose license may be on the line, will have been participating actively in the program with the knowledge that should he fail to attend a meeting or should he deposit a dirty urine, there would be the consequence of loss of licensure. Most programs that specialize in treating licensed categories of patients, physicians, attorneys, or nurses, have extremely high compliance for this reason. They have many clean urine tests and very good meeting attendance. This reinforcement of the treatment goals may seem self-evident to us. However, for some addicts, failure at two or three programs is not uncommon. At some point, however, they will have to believe in their own ability to achieve sobriety and in our firm conviction that they can attain it.

When a dirty urine is produced, the only way it works clinically as a monitoring safeguard for the patient is if there are consequences. As a support and stimulant for patient motivation, I have found that clinically there is no stronger tool. It is of clinical note that in

all my years and untold thousands of urine screens, no one has ever admitted to a positive urine. Addicts will confess when confronted with the clinical evidence of relapse: missed meetings, absenteeism, borrowing money from peers, or change in a new found interest; or they deny drug use to the end. That is to say, they deny it in the face of positive urine screens. Yet, alcohol has to be consumed. The denial of drug use in the face of positive testing denotes an extremely severe degree of psychopathology. The grandiosity, the negation of the importance of the other, and the temerity of the addict are all important characterological aspects of the drug addict that need to be psychotherapeutically addressed before an addict can achieve sobriety. Unfortunately, such treatment could take years. The pragmatic adherence to an effective limit, i.e. dirty urine, is the only effective resource in preventing relapse.

There is no clinical correlation between behaviors and words in the treatment of substance abuse. One of the greatest dangers of a psychotherapeutic approach to the treatment of the drug addict is that the problem of drug abuse gets addressed only verbally. The addict will continue blithely to abuse drugs simply because no one has administered a urine screen.

Psychologically speaking, what does this mean? It means that the addict has not dealt with the issues of lying, grandiosity, manipulateness, negation of others, "both as objects and beings." That is to say, the addict will be placing his family in financial risk, himself at physical risk, and his spouse at physical risk (AIDS), and no one will be the wiser. Behaviorally, an addict still may be attending meetings, keeping therapist appointments, and dealing with issues. He may be maintaining his job. This situation is remarkable and frightening. Eventually, the shoe will drop, the drug addict will miss an appointment, fail to pay a bill, or ask to borrow money. Excuses will begin to pile upon excuses.

Total disruption of any treatment plan soon will follow. And, it continues because urine testing on a random basis was not done. Urine testing may be done, but if inadequately supervised, the test results are meaningless. Patients can take any number of extremely inventive approaches to passing fully supervised urine tests. They have stockpiled clean urines, bought or manipulated clean urines from others, added bleach to urine, drank vinegar, and taken natural diuretics and pharmaceuticals to diuresis a clean urine. Addicts can produce relatively warm urine from plastic spray containers, rubber hosing down the arm, or using the sink in the bathroom. An addict will skip an appointment because his car broke down, he worked overtime, or his grandmother died. What an addict is doing is wasting time until the next night or two nights hence, so the urine will be clean from the heroin used over the weekend (Table 4).

The detection of unsuspected drug use is difficult at best, and downright impossible if the clinician is not highly suspicious. Thus, it is a clinical truism that in the outpatient treatment of drug addicts, only two things are important, urine testing reports and behaviors. As soon as one changes negatively, the clinician must assume the patient has relapsed and the treatment plan needs to be revised or at least reviewed.

An outpatient treatment plan for drug addiction is confronted with denial about relapse almost everywhere (Table 5). The most common sources of relapse occur around the most common events: need for dental surgery, trauma—car accident, new losses—in the family; holiday reemergence of untreated medical or psychiatric problems—specifically depression; new signs of the old disease; and change of treatment plan without prior discussion with a therapist or counselor. This list is not complete. Clinical examples include treating patients with antidepressants, anticonvulsants, and antipsychotics; which can be a critical and crucial part of recovery. Unfortunately, there is little data on this topic. When I had a patient on antidepressants going from inpatient to outpatient treatment who discontinued the antidepressants without prior consultation, I can say with clinical surety that he was having severe urges and not dealing with relapse issues at groups or in therapy. I can predict that if a patient managed to manipulate the discontinuation of medications with his physician's approval, he generally would relapse within a month.

An illustrative example concerning dental surgery will prove this point. A dental surgeon will give the patient a prescription for Percodan® as the patient is leaving the office. The patient will fill the prescription, follow the recommended schedule, and deposit a dirty urine. What do you do? What does this mean? Again, the treatment plan has to be reviewed. It may mean that clinically we made a mistake by not placing the patient on the opiate receptor blocker, naltrexone. Alternatively, it may mean that the patient needs to be confronted about the issue of denial and taking back control of treatment, or it may mean that the patient needs to be rehospitalized because he will begin to discuss severe uncontrollable urges and cannot be maintained in less than a highly structured environment.

Whatever the source of the denial, there is no greater source of clinical justification of revising a treatment plan than a positive urine screen (Table 6). It is a concrete, specific, palpable demonstration that the patient perhaps is out of control with drug abuse. Certainly, the patient will have begun to utilize old coping mechanisms like lying, negation, or manipulation. These issues would need to be confronted in therapy. The positive urine screen could be used to educate the family to the need for decreasing financial support or increasing the structure required by the patient. It can be used to increase the job jeopardy pressure on the patient. It can be used simply to confront the patient and allow him to make the decision as to whether he wants to approach his disease responsibly and coherently and continue in treatment, or risk loneliness, loss of family, financial damage, and self-destruction.

SUMMARY

Urine testing is a major therapeutic tool in preventing and monitoring relapse. Drug abuse can be viewed as a behavioral disease, not as a psychological or verbal disease. Hence, urine monitoring must be clinically tied directly to consequences within the treatment plan. This allows the clinician to become something other than another person to be manipulated by the

verbally skilled addict. Most clinically relevant urine testing should include: strict supervision of the urine taking; high frequency of taking urines—at least two a week, to prevent time lapse/drug metabolism; availability of a full range of urine tests; continuous testing throughout the treatment course; and patient informed consent to discuss all drug-related issues with relevant others.

NEW JERSEY MEDICINE

Presents a Special Issue

Treating Tobacco Dependence

Copies of this issue are available for \$5.
 Orders over 20 copies, call for prices.

NEW JERSEY MEDICINE

The Journal of the Medical Society of New Jersey
 Two Princess Road
 Lawrenceville, NJ 08648
 (609) 896-1766

Your medical practice
is a business, and if
that business does not
run efficiently, it will
affect your patient and
public relations.

MARY ANN HAMBURGER ASSOCIATES

would evaluate each element
of your office operations and
work with you...confidentially...
on an individual basis, to help
you achieve your aims as a
businessperson and as a
practicing physician.

Mary Ann can help by evaluating your:

- APPOINTMENT and/or SURGERY SCHEDULING • BILLING
- BOOKKEEPING • COLLECTIONS • CPT CODES and MACC
- PROFILES— ICD CODES • EQUIPMENT and SUPPLIES • FEE
- SCHEDULES • FILING SYSTEM • HIRING and TRAINING of
- NEW and PRESENT PERSONNEL • INSURANCE (THIRD PARTY
- BILLING) • OFFICE LAYOUT and LOCATION • PATIENT FLOW
- RECALL SYSTEM • RECRUITMENT FOR HOSPITALS
- PURCHASING and SELLING of MEDICAL PRACTICES
- TELEPHONE MANAGEMENT

Mary Ann can recommend specialists

for your business practice in these vital areas:

- ACCOUNTING • FINANCE • INSURANCE • LAW

Mary Ann Hamburger offers you many services
ranging from a one-time survey to a continuing service
in which she will make regular visits to your office
to help with any pending problems.

A Little Behind In Managing Your Finances?

AMA Advisers MONEY MASTER Account...

Even if you're pretty much on top of your personal or business money management duties, there's an easier way to handle it all that can save hours of your precious free time. It's the **AMA Advisers Money Master Account**, a state-of-the-art financial management system for managing your assets, investments, savings, expenses — even your insurance! With **Money Master**, you'll discover how easy personal finance can be.

AMA Advisers Money Master Account simplifies financial management with:

- **Your Own Budget Analysis...** through the use of coded checks you'll see your monthly expenses sorted and totaled into one of 37 pre-set categories such as insurance premiums, charitable contributions, education, utilities, vacation and many more. Great for personal or professional budgeting!
- **Discount Brokerage Services...** that enable you to trade stocks, bonds, government securities, options and of course, mutual funds.
- **One Monthly Statement for ALL Your Investments.** In addition to investments made through your **AMA Advisers Money Master Account**, simply supply us with the appropriate information and for your convenience, we'll track your investments, even those made through other brokers or mutual fund organizations. All that you tell us about will be shown on your **Money Master** statement.

Building Mutual Trust

AMA ADVISERS, INC.

AMA Advisers, Inc. is a subsidiary of the American Medical Association and manages the mutual funds in The AMA Group.

Services and products as described herein are not offered for sale in any state where they are not lawfully registered.

• **Special Year-End Statement Practically Completes Your Tax Return For You!** At year end, you'll receive a statement so complete that it even shows the proper tax schedule to use for filing your return! All you do is transfer the information to the form.

• **High Money Market Returns On Your Checking Account!** You earn money market rates on all the money in your account until the day your check clears, since an AMA Money Fund Account is opened through the **Money Master Account**.

If you would like convenience of a **Money Master Account**,

CALL TOLL FREE: 1-800-AMA-FUND
Ext. 1438 TODAY! (262-3863)

Or, complete and mail the coupon. You'll receive a complete **Money Master Account** Information Kit with an application to open the one account for all your investment needs. An AMA Money Fund prospectus will be included for complete details on fees and expenses relating to the fund. Please read the prospectus carefully before you invest or send money.

Collecting money.

It's an ugly job, but somebody has to do it.

Nobody likes to collect money, but it *can* be done well, with efficiency and fairness.

That's what I.C. System is all about. We're in business to collect money that's owed you, and we do our work with great efficiency.

At the same time, we understand that debtors are human beings, too, and should be treated as such. And while we believe in results, we also believe there's no need to alienate people, particularly those who sincerely want to pay.

It is that very philosophy that has been the foundation of our operation for almost fifty years. And, no doubt, it is contributory to the fact that our work is endorsed by over 1,200 professional and trade associations, including yours.

Although we're headquartered in St. Paul, Minnesota, we have communication centers in every state of the union. We'll assign a local I.C. representative to your account who will be supported by a full range of collection services and personnel, including carefully-trained telephone contact specialists. We'll even provide initial training on how to use our service for the person(s) in your office handling accounts receivable.

But most important, we *guarantee* results. Our fee structure

combines a very competitive commission rate with a retainer (corporate or standard) scaled to your needs. And we guarantee to keep collecting for as long as it takes to recover *at least ten times the amount of that retainer*.

To find out how the I.C. System approach can work for you, call toll free (800) 443-4123, ext. 621. In Minnesota, call (612) 483-8201, ext. 621. Or return the coupon.

I want to recover the money that's owed me. Please provide me with information on the I.C. System approach.

UMDNJ Notes; Physicians Seeking Location in New Jersey

UMDNJ Notes

**Stanley S. Bergen, Jr., MD
President**

On November 8, you will have the opportunity to cast a vote for the \$350 million "Jobs, Education and Competitiveness Bond Act of 1988," a bond issue which would provide funding for much-needed construction and renovation projects at New Jersey's colleges and universities as well as support for new programs in science and technology.

UMDNJ will benefit directly from the funds generated by the bond issue, since \$25 million of the total is earmarked for our projects. In combination with institutional matching funds, these funds will support construction and expansion of needed facilities to house important educational and research programs at our campuses in northern, central, and southern New Jersey.

These funds are of vital importance if we are to continue our advancement toward excellence and national prominence. To build upon the progress we have made already, we must have the facilities which will permit the growth and refinement of our programs.

Therefore, I ask that you join me in casting a vote for a strong state health sciences university. On election day, please vote yes for the "Jobs, Education and Competitiveness Bond Act."

I am pleased to announce the appointment of Dr. Norman Edelman, a member of our faculty for 16 years, as dean of the Robert Wood Johnson Medical School. This appointment was made following an intensive national search.

An acknowledged authority in the field of pulmonary medicine, Dr. Edelman joined the school in 1972 as professor of medicine and chief of the pulmonary disease division. He has served with distinction as a teacher, clinician, researcher, and administrator as the acting dean, and as the medical school's associate dean for research. As interim director of the Center for Advanced Biotechnology and Medicine at the Piscataway campus, Dr. Edelman played a major role in helping to establish this important advanced technology center.

Dr. Edelman is a member of the governing council, New Jersey Thoracic Society. His several other professional endeavors include membership on the editorial boards of the *Journal of Applied Physiology* and the *American Review of Respiratory Diseases*. Dr. Edelman was serving as acting dean prior to his appointment.

A special University-wide task force has been formed to develop a Minority Health Institute that will be dedicated to addressing issues related to the health status of minorities and the disadvantaged in New Jersey.

The Institute's mission will be to analyze risk factors associated with preventable morbidity and premature mortality among blacks, hispanics, other minorities, and poor populations in the state and to develop and recommend priorities that establish measurable interventions for those risk factors.

The University has embarked on this action in part as a response to published national studies which show that minority populations experience about 60,000 more deaths per year than white populations.

In addition to identifying specific risk factors and preventive measures, the proposed Institute will promote educational opportunities

and the recruitment and retention of minorities into health care fields. It also will offer information to the community, health professionals, and government agencies on means to reduce the impact of major risk factors associated with illness and death.

The task force has proposed that the Institute focus on four main areas. They are: development of a data bank on minority health risk factors; development of new health education programs that emphasize awareness and prevention; establishment of research programs to help further our understanding of health problems affecting minorities and the poor; and development of a fundraising component to help support Institute projects.

Joining me on the Minority Health Task Force are 18 colleagues representing our campuses throughout the state. George Hampton, our vice-president for urban and community affairs, is task force chairman. A project director is being recruited to help organize the Institute and begin implementing its programs.

UMDNJ's long-standing commitment to providing educational opportunities for minority and disadvantaged youth is reflected in our special summer programs designed to improve academic skills and to spark interest in health-related careers. This summer, more than 200 young students participated at all three of our campuses.

In Newark, the pre-college program, which is cosponsored by several area institutions, devoted six weeks to instruction and counseling for 125 high school pupils.

In both Newark and Piscataway, a small group of young scholars on our Minority High School Science Apprentice Programs participated in research projects with New Jersey Medical School and Robert Wood Johnson Medical School faculty members.

And more than 100 Camden youths studied math and science as part of the Camden Science Pipeline project at our School of Osteopathic Medicine. A majority of the students already had participated in the project's first phase, called the Early Bird Program. The overall plan takes promising students through several phases, including a college level component, all designed to help prepare students for health careers.

Congratulations are extended to members of our faculty for these achievements:

Dr. Joel A. DeLisa, professor and chairman of the Department of Rehabilitation Medicine at New Jersey Medical School, has been appointed a director of the American Board of Physical Medicine and Rehabilitation. Dr. DeLisa, who also is medical director and chief medical officer of the Kessler Institute for Rehabilitation in West Orange, becomes one of ten board members of the organization.

Dr. DeLisa's prominence in his field was underscored with the recent publication of his book, *Rehabilitation Medicine: Principles and Practice*, published by J.B. Lippincott, of Philadelphia. The book, with contributions from more than 100 specialists, is an outstanding resource for a growing medical field.

Two physicians on the faculty of the School of Osteopathic Medicine have been elected distinguished practitioners in the National Academy of Practice in Osteopathic Medicine. They are: Dr. Charles Steiner, professor and chairman, and Dr. Eleanor V. Masterson, associate

professor, in the Department of Clinical Osteopathic Sciences at the school.

The National Academy of Practice in Osteopathic Medicine is one of nine National Academies of Practice founded to advise the Congress on health matters. Each academy limits its membership to 100 medical professionals and only ten distinguished practitioners are elected by their peers each year for their contributions to health care practice.

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ALLERGY—Grant H. Greeley, M.D., 6305 Snow Heights Ct., El Paso, TX 79912. SUNY Downstate 1979. Also, internal medicine. Board certified. Also, board certified (IM). Partnership or multi-

specialty group within commuting distance of New York City. Available May 1989.

CLINICAL UPDATE PULMONARY MEDICINE

December 7, 1988

COURSE DESCRIPTION:

The 5th Annual Clinical Update is designed to provide family practitioners, general internists, pulmonologists and other interested physicians with an updated review of pulmonary disorders which are commonly encountered in clinical practice as well as certain disorders which are of current topical interest. The program has been carefully selected to ensure a good blend of established and new methods and approaches to pulmonary diseases.

The morning session will provide participants with systematic approaches to chest x-ray interpretation, pleural effusion, atypical pneumonias (*Legionella*, *Mycoplasma*, *Chlamydia*, viral, fungal) and pulmonary disorders produced by cardiovascular disease.

The afternoon session will present current concepts in the diagnosis and management of idiopathic pulmonary fibrosis and lung cancer. A special lecture will focus on the current status of lung transplantation for end-stage pulmonary disease. This session will conclude with a discussion of the pulmonary assessment and management of the surgical patient with lung disease.

Throughout the day, emphasis will be placed on risk factors, natural history, early detection, prognosis, newer diagnostic techniques and new methods of therapy.

A.M. MORNING SESSION

- 8:00 Registration
- 8:50 Welcome—*Vladir Maranhao, M.D.*
- 9:00 A Practical Guide to Chest X-Ray Interpretation
Wallace T. Miller, M.D.
- 9:50 Differential Diagnosis of Pleural Effusions
Steven A. Sahn, M.D.
- 10:40 Coffee Break
- 10:55 Pulmonary Disorders Produced by Cardiac Disease
David M.F. Murphy, M.D.
- 11:45 The Spectrum of Atypical Pneumonias
Steven A. Sahn, M.D.

P.M. AFTERNOON SESSION

- 12:30 Luncheon
- 1:30 Clara Falk Franks Lecture—Clinical Decisions in Idiopathic Pulmonary Fibrosis
J.A. Peter Paré, M.D.
- 2:20 Lung Transplantation for End-Stage Pulmonary Disease
Joel D. Cooper, M.D.
- 3:10 Coffee Break
- 3:25 Lung Cancer in 1988—Staging and Expectations of Surgery
Joel D. Cooper, M.D.
- 4:15 Reducing the Risk of Postoperative Pulmonary Complications
Mervyn Feierstein, M.D.
- 5:00 Adjourn

GUEST FACULTY

JOEL D. COOPER, M.D., Professor of Surgery and Chief, Section of Thoracic Surgery, Washington University School of Medicine, St. Louis, Missouri

WALLACE T. MILLER, M.D., Professor and Vice Chairman, Department of Radiology, Hospital of the University of Pennsylvania, Philadelphia, Pennsylvania

J.A. PETER PARÉ, M.D., Professor Emeritus of Medicine, McGill University School of Medicine, Royal Victoria Hospital, Montreal, Quebec, Canada

STEVEN A. SAHN, M.D., Professor of Medicine and Director, Division of Pulmonary and Critical Care Medicine, Medical University of South Carolina, Charleston, South Carolina

LOCAL FACULTY

MERVYN FEIERSTEIN, M.D., Program Director, Attending Pulmonologist, Department of Pulmonary Medicine, Deborah Heart and Lung Center

VLADIR MARANHÃO, M.D., Clinical Associate Professor of Medicine, UMDNJ-Robert Wood Johnson Medical School, New Brunswick, New Jersey; Chairman, Department of Cardiology and Vice President of Medical Affairs, Deborah Heart and Lung Center

DAVID M.F. MURPHY, M.D., Program Chairman, Chairman, Department of Pulmonary Medicine, Deborah Heart and Lung Center

FIFTH ANNUAL CLINICAL UPDATE IN PULMONARY MEDICINE

Sponsored by:

Deborah Heart and Lung Center
Browns Mills, New Jersey
(609) 893-6611

Wednesday, December 7, 1988

NAME _____

ADDRESS _____

CITY/STATE _____ ZIP _____

SPECIALTY _____ PHONE (____) _____

Tuition: All participants, fee includes luncheon and refreshments—\$80.00.

A check in the amount of \$80.00 payable to Deborah Heart and Lung Center should accompany this application. Mail to Pulmonary Department, Deborah Heart and Lung Center, Browns Mills, N.J. 08015.

Due to limited seating capacity, early registration is strongly advised. Registration deadline—Wednesday, November 23, 1988.

Accreditation: Deborah Heart and Lung Center designates that this continuing education offering meets the criteria for 6.5 credit hours in category 1 of the Physician's Recognition Award of the American Medical Association.

This program has been reviewed and is acceptable for 6.5 prescribed hours by the American Academy of Family Physicians.

For Program Information please call: Mrs. Diane Colby (609) 893-6611.

Hospital, Passaic
(AMNJ)
- 16 **Evaluation and Management of
Kidney Stones**
1:30-2:30 P.M.—HMO,
New Brunswick
(Rutgers Community Health Plan)

December

- 14 **Urology Rounds**
6:20-8:30 P.M.—Robert Wood
Johnson Medical School, 108B,
New Brunswick
(UMDNJ)

CANCER PAIN

The Second in the Ongoing Series
on Multidisciplinary Management
of the Patient with Cancer.

Dec. 8th and 9th.

SURGICAL ONCOLOGY II

The second "Multidisciplinary Management of the Patient with Cancer" seminar at Fox Chase Cancer Center is a review of advances in and techniques of pain management for cancer patients. National experts will conduct lectures and workshops focusing on the interdisciplinary management of cancer pain, with opportunities for active exchange of knowledge.

For more information and reservations, please call Kathy Smith at 215-728-2715.

FOX CHASE
CANCER CENTER
7701 Burholme Avenue Phila., PA 19111

As an organization accredited by the Accreditation Council for Continuing Medical Education, Temple University School of Medicine certifies that this program meets the criteria for 9.5 credit hours of Category I, provided it is completed as designed.

LETTER TO THE EDITOR

Medicare Participation

Dear Doctor Slobodien:

The Medicare program, since its inception, has posed the threat of socialized medicine.

The gross miscalculation of the original cost projections was inexcusable. There is a temptation to charge it off to stupidity, but politicians, whatever else they might be, are rarely stupid.

The scenario, which now should be retrospectively clear, was to buy votes with lavish promises, and then find scapegoats upon whom to blame the failure.

The stated assurance of noninterference into the doctor-patient relationship was disavowed once the

program was established.

Long before Alzheimer's became fashionable, time was taking its toll on memory. Too few people remember that Medicare was to have been a "supplemental" health insurance. Along the way, it has been converted, at least in rhetoric, to an entitlement.

Present participation constitutes "welfare for the wealthy."

Our time-honored tradition of treating the truly needy at low or no cost still exists to a large degree. Most doctors accept what Medicare is willing to pay in selected cases. Usually, all that is necessary is for the patient to ask. In the current competitive atmosphere, even those lacking our customary compassion are likely to comply.

What was left of the voluntary free-choice elements of Medicare permitted ample latitude for resolving the problems of the needy on an individual basis. Organized medicine either has been unwilling or unable to get these simple facts to the general public. Refusal by all physicians to abandon the long-standing process of billing fair fees, and making appropriate adjustments where indicated would have scuttled this whole scheme. Those entrepreneurs, who chose to practice wholesale, cut-rate medicine could have taken an ad in the local paper. Ironically, they probably are the same individuals who have tarnished our image by exploiting the system, and likely are nonmembers of our organizations.

This whole push for participation has been a coercive effort to alter public perception, and stampede physicians into involuntary servitude. There has been no attempt to hide the plan, once voluntary par-

ticipation reaches an adequate level, to make compliance mandatory. If there is any doubt, let me offer our New Jersey DRG experience as a vivid example of that *modus operandi*.

My personal policy of dealing directly with the patient has had some obvious and some subtle benefits. It has spared me the cost and frustration of dealing with the computerized bureaucracy. My patients have learned first-hand about the trials and tribulations of dealing with their benevolent benefactors.

The "participation scam" should be attacked on several grounds:

First, the publication of participant lists gives the false impression that nonparticipants will not treat, or will charge excessive fees to Medicare patients.

Second, differential payments, which penalize nonparticipants, represent a further unfairness, above and beyond the grossly discriminatory mandatory fee freezes of the past few years.

Last, but not least, the Massachusetts preview of things to come should provide sufficient incentive for resistance.

We have become the victims of a succession of bad ideas. Rather than offering outright opposition, the AMA repeatedly has chosen to maintain a conciliatory position. Negotiated minor concessions, at best, have delayed slightly the eventual devastating impact upon our lives and our livelihood.

Coupled with private sector third-party activities, the box that we are in has been pretty neatly wrapped. We had better take some definitive action, before the bow is affixed for presentation to Big Brother!

(signed) Frank J. Primich, M.D.

Gynecologic Surgery; The Hand; Mycobacterium tuberculosis: Interactions with the Immune System

Gynecologic Surgery

Luis E. Sanz, M.D., (ed). Oradell, NJ, Medical Economics Books, 1988. Pp. 451.

Gynecologic Surgery is written clearly, is well illustrated, and describes concisely many current gynecologic operative techniques. Chapters cover general, vaginal, and urologic surgery, as well as some newer laparoscopic and laser techniques. A particularly valuable section includes detailed surgical methods of managing complications of gynecologic surgery such as bladder and bowel injuries.

Tight editorial control has eliminated most of the duplication that can be found in some multi-authored texts. The contributors all give generously of their expertise in providing useful information, not only by a clear description of the operative procedure; but also in providing information on specific suture material and equipment setting, where appropriate. The reader more easily then may duplicate their techniques.

This book is recommended for pelvic surgeons and may be especially useful to gynecologists who wish to review or learn the latest techniques in their specialty.

Gerard F. Hansen, M.D., M.P.H.

The Hand, Volume III

Raoul Tubiana, M.D., (ed). Philadelphia, PA, W.B. Saunders Co., 1988. Illustrated. Pp. 1,296.

This is the third of four volumes entitled, *The Hand*; it is edited by Dr. Tubiana, renowned hand surgeon of the Hand Institute in Paris. Volume I was published in 1981 and deals with anatomy and basic sciences; Volume II appeared in 1985, and Volume IV has yet to be released. Volume III deals with trauma to tendons, nerves, and blood vessels; as well as thermal injuries, bite wounds, and amputations.

There are 110 contributors of international repute; of the 114 chapters, nearly a third are written by Dr. Tubiana. Like most multi-authored textbooks, the same subject may be discussed by different authors independently of the others, leaving the reader at the mercy of the index which, while fairly complete, causes a great deal of finger-walking. The table of contents is excellent, however. Oddly, footnote references are made to as-yet-unreleased Volume IV. Neither the table of contents nor the index lists materials in the earlier volumes—a serious flaw.

This is a comprehensive surgical reference work intended for surgeons with a major interest in the hand; it is not for students or for residents. The illustrations are mostly black-and-white. The drawings are excellent, but the photographs are not. Some are silly for an advanced surgical text, such as one showing the harvesting of palmaris longus for tendon grafting. Many others are too dark to show anatomic detail. There are only eight color plates in the book.

Some of the material is outdated. The chapter on recent advances in peripheral nerve surgery cites not one reference earlier than 1983. Reflex sympathetic dystrophy (RSD) is called only by its obsolete name, causalgia (coined in 1864), and it is discussed under war injuries. The latest reference is 1978 despite significant advances in RSD.

Although there is much good material in this book, it suffers from fragmentation and obsolescence. It already has taken the better part of the decade to publish.

Richard M. Ball, M.D.

Mycobacterium tuberculosis: Interactions with the Immune System

Mauro Benine-li and Herman Friedman, (eds). New York, NY, Plenum Press, 1988.

This is the second book in the series entitled, *Infectious Agents and Pathogenesis*. Studies on the mechanisms of disease caused by infectious agents require an expansive knowledge of many areas, especially immunology, as well as integrating experiments of basic science and clinical research.

The text is directed mainly towards individuals requiring more indepth knowledge of tuberculosis.

Robert Koch's discovery, that tuberculosis was caused by an infectious agent, revolutionized our thinking about diseases. Koch's postulates actually developed with tuberculosis in mind and became a focal point for many advances in microbiology and medicine. According to the World Health Organization, there are at least 30 million individuals in the world today that are affected by tuberculosis and as many as 1 million die as a result of it every year. Although this disease is a major public health problem in developing countries, there has been recent concern that the disease might once again manifest itself with renewed virulence in more developed countries, such as the United States, due to the spread of the human immunodeficiency virus causing AIDS.

This text is highly recommended for all individuals wishing to pursue more indepth study of this fascinating organism. The text is well organized, starting with the more mundane characteristics of mycobacterial diseases; the book reveals many areas that require further analyses. The editors and authors of this volume have organized the burgeoning information that presently is available on *M. tuberculosis* and its interaction with the immune system. The text provides an environment for interdisciplinary studies of this extremely important area of investigation. As stated by the editors, "Few infections, if any, illustrate the complexity and the double-edged nature of immune responses as effectively as tuberculosis." Leonard Bielory, M.D.

**Drs. Fox; Holland;
O'Grady; Pessah; Stekler;
Tschekunow; Willan;
Woodward**

Dr. Irving R. Fox

Irving R. Fox, M.D., a pediatrician in Union for 36 years, and founder of the Union Pediatric Medical Group, died on June 21, 1988, at the age of 64. A Paterson native, Dr. Fox received his medical degree from the New York University School of Medicine, in 1947. A diplomate in pediatrics, Dr. Fox was an affiliate of Newark Beth Israel Medical Center; Elizabeth General Medical Center, as chief of pediatrics; St. Elizabeth Hospital, Elizabeth; and Saint Barnabas Medical Center, Livingston. During World War II, Dr. Fox served with the United States Navy, and he was a U.S. Air Force captain in the Korean Conflict. Dr. Fox was a member of our Union County component and of the American Medical Association.

Dr. Albert H. Holland

Retired Morristown physician Albert Harold Holland, Jr., M.D., died on June 13, 1988, at the age of 69. A Morristown native, Dr. Holland received his medical degree at New York University School of Medicine, in 1944. In addition to private practice in Morristown, Dr. Holland was a lecturer for the Department of Nutrition and Metabolism, Northwestern University, Chicago, from 1955 to 1958. He served with the

U.S. Army as lieutenant from 1946 to 1947, and with the U.S. Public Health Service from 1954 to 1958. Dr. Holland was a member of our Morris County component and of the AMA.

Dr. Michael J. O'Grady

Retired since 1986 from surgery practice, Michael James O'Grady, M.D., 78, died on March 19, 1988. Born in Newark, Dr. O'Grady received his medical degree at Georgetown University School of Medicine, Washington, D.C., in 1933. As well as maintaining a Belleville office, Dr. O'Grady was affiliated with Clara Maass Medical Center, Belleville; Saint Barnabas Medical Center, Livingston; and The Mountainside Hospital, Montclair. A member of our Essex County component and of the AMA, Dr. O'Grady was a fellow of the American and International Colleges of Surgeons, and of the New Jersey College of Colon-Rectal Surgery. He was a lieutenant commander in the U.S. Navy during World War II. In 1983, Dr. O'Grady received the Golden Merit Award.

Dr. Joseph L. Pessah

Internal medicine specialist Joseph Leo Pessah, M.D., 54, died on May 5, 1988. A native of Tuzla, Yugoslavia, Dr. Pessah received his medical degree from Belgrade University Medical School, Yugoslavia, in 1964. After emigrating to the United States and establishing a private practice, Dr. Pessah became affiliated with The Mountainside Hospital and Montclair Community Hospital, both in Montclair. He was a member of our Essex County component and of the AMA.

Dr. Burton L. Stekler

Pediatrician Burton Lester Stekler, M.D., 63, died on June 19, 1988. A Brooklyn, New York, native, Dr. Stekler received his medical degree from New York University School of Medicine, in 1950. A diplomate in pediatrics and a fellow of the American Academy of Pediatrics, Dr. Stekler was affiliated with The Valley Hospital, Ridgewood, helping to establish its Drug Center. He was instrumental in starting the Glen Rock Blood Bank and was physician for the Glen Rock High School. From 1953 to 1955, Dr. Stekler served with the U.S. Army as

first lieutenant. Dr. Stekler was a member of our Bergen County component and of the AMA.

Dr. Alexej Tschekunow

Retired pathologist and former Sussex County medical examiner Alexej Tschekunow, M.D., 64, died on May 21, 1988. Born in the Russian Ukraine, Dr. Tschekunow received his medical degree from the University of Munich, Germany, in 1953. With the aid of the International Rescue Group, Dr. Tschekunow emigrated to the United States in 1955, settling in Long Branch. He became affiliated with several hospitals, including Wallkill Valley General Hospital, Sussex, where he was chief pathologist and laboratory director from 1967 until his retirement in 1985. Dr. Tschekunow was medical examiner for Sussex County from 1968 until 1985. He was a member of our Sussex County component, of the National Association of Medical Examiners, and of the AMA.

Dr. Edward H. Willan

Retired general surgeon Edward Hallick Willan, M.D., died on May 31, 1988, at the age of 93. He attended New York Medical College, where he received his medical degree, in 1916. In addition to an East Orange private practice, Dr. Willan maintained an affiliation with East Orange General Hospital for over 40 years, where he was president of the staff for 14 years, member of the Board of Trustees, head of the Surgical Department, and instructor of surgical nursing. A fellow of the American College of Surgeons, Dr. Willan was a member of our Essex County component and of the AMA. During World War I, he was a captain in the U.S. Army medical corps. In 1966, he received the Golden Merit Award.

Dr. William J. Woodward

Internal medicine specialist William John Woodward, M.D., 66, died on June 15, 1988, after 35 years as a physician in Asbury Park. Born in Atlantic Highlands, Dr. Woodward received his medical degree from Jefferson Medical College of Philadelphia, Pennsylvania, in 1947. A diplomate in internal medicine and a fellow of the American College of Physicians, Dr. Woodward was a member of our Monmouth County component and of the AMA.

AUTHOR INFORMATION

NEW JERSEY MEDICINE is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in NEW JERSEY MEDICINE is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.
2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

STAFF PSYCHIATRIST

Tired of breathing polluted air? Irritated at having to pay private school tuition in addition to taxes for your children's education? Weary of spending two hours a day commuting? Unhappy having to triple lock your doors and still be concerned for your family's safety? Then strongly consider moving to Knoxville, Iowa. Contemporary hospital based psychiatry with friendly colleagues who keep up with their medical fields. All the advantages of working for VAMC with paid vacation, sick leave, reasonable workload, appreciative patients and staff. Day Care Center on station available to VAMC working parents. (You may have lunch with your child.) Iowa Public High School students consistently score higher than other 49 states on S.A.T.'s. All cultural opportunities available in Chicago or Minneapolis (4-5 hours by car). Knoxville is a friendly, up-to-date town with contemporary stores. Des Moines (state capital) is less than one hour away by car. If you think this is too good to be true, call Dr. Lynn Huebler, 515-842-3101, Ext. 6003, and arrange to visit for an interview.

Equal Opportunity Employer.

REAL ESTATE PARTNERSHIPS?

You've probably heard that partnerships don't make sense anymore without the tax benefits. We suggest that if you participate in our unique situations, the tax benefits will not seem important . . . considering the profit potential!

We are working with substantial New Jersey Real Estate developers who use private investor capital as a component of their project financing. Our goal is to make you money and keep some of it reinvested with us. In an effort to reduce your out-of-pocket cash, we have financing available for those who wish to leverage the commitment.

If short-term, non-syndicated/loaded private situations interest you, your inquiry is welcome.

Seasoned investors only.

DALE L. TIPTON, M.D.

Associate Clinical Professor, Department of Otolaryngology, Head and Neck Surgery, University of California School of Medicine, San Francisco, California.

Chairman, Division of Otolaryngology, Franklin Hospital, San Francisco, California.

Lieutenant Colonel, U.S. Army Reserve.

EDUCATION University of California at Berkeley, A.B. Physiology; University of California School of Medicine, San Francisco, M.D. and Master of Science, Pharmacology.

RESIDENCY University of California School of Medicine, San Francisco: General Surgery — 2 years; Otolaryngology — 3 years.

FELLOWSHIPS National Institute of Health Fellow; Cancer Research Institute, University of California, San Francisco.

OUTSTANDING ACHIEVEMENTS Freshman Medical Student Research Award; Class President — 2nd year medical school; Student Body President — senior year medical school; Special Award by National Institute of Health to attend and present paper at International Congress of Otolaryngology in Tokyo, Japan; Chairman, Department of Otolaryngology, San Francisco General Hospital 1970-76; Chief of Medical Staff, Franklin Hospital 1982-84.

Tipton and residents examining post-operative patient in recovery room.

“I joined the Army Reserve shortly after completing my responsibilities as Chief of Staff of Franklin Hospital in San Francisco. I was intrigued with the idea of trying something different, such as Army Medicine.

“I find that the challenges and rewards of serving as an Army Reserve physician complement my civilian practice. For a number of years, I’ve been teaching as a member of the Clinical Faculty at the University of California School of Medicine, and I thoroughly enjoy the many teaching opportunities available to me in the Reserve. It is a rewarding experience to be involved in the training of Army medical students, interns, and residents. I also enjoy interacting and exchanging information with full-time Army physicians and seeing a wide variety of interesting clinical cases.

“After 18 years of private practice, I find it stimulating to be able to use my experience and expertise in a totally different medical setting. I highly recommend Army Medicine to any interested physician.”

Find out more about the medical opportunities in the Army Reserve. Call toll free 1-800-USA-ARMY.

We're Proud To Salute the Nation's #1 Money Manager

Integrated Resources Asset Management

According to CDA Investment Technologies, Inc.* Integrated Resources Asset Management (IRAM) was named the top-ranked money manager for the three year period ending December 1987.

All of us at Integrated Resources Equity Corporation would like to congratulate the IRAM team on a job well done. As the investment advisor for numerous institutional investors and individuals with port-

folios in excess of \$100,000, IRAM has built a reputation for being one of the country's most dependable and accessible money managers.

If, like so many other substantial investors, you're interested in having your portfolio professionally managed, stop by your local Integrated Resources Equity Corp. office and find out how you can put the nation's top-ranked money manager to work for you.

Top-ranked U.S. money manager for the three year period ending December 1987 was Integrated Resources Asset Management Corp., based upon filings with the SEC. Filing data was analyzed by CDA Investment Technologies, Inc.

Carafate[®] for the ulcer-prone NSAID patient

Aspirin  and other nonsteroidal anti-inflammatory drugs weaken mucosal defenses, which may lead NSAID  users to become prone to duodenal ulcers.¹ For those NSAID  users who do develop duodenal ulcers, CARAFATE[®] (sucralfate/Marion) is ideal first-line therapy. Carafate rebuilds mucosal  defenses through a unique, nonsystemic mode of action. Carafate enhances the body's natural healing ability while it protects damaged mucosa from further injury. So the next time you see an arthritis patient with a duodenal ulcer, prescribe nonsystemic Carafate:  therapy for the ulcer-prone patient.

Unique, nonsystemic

CARAFATE[®]
sucralfate/Marion

CARAFATE[®] (sucralfate) Tablets

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that simultaneous administration of CARAFATE (sucralfate) with tetracycline, phenytoin, digoxin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The clinical significance of these animal studies is yet to be defined. However, because of the potential of CARAFATE to alter the absorption of some drugs from the gastrointestinal tract, the separate administration of CARAFATE from that of other agents should be considered when alterations in bioavailability are felt to be critical for concomitantly administered drugs.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Chronic oral toxicity studies of 24 months' duration were conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). There was no evidence of drug-related tumorigenicity. A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies were not conducted.

Pregnancy: Teratogenic effects. Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients treated with sucralfate, adverse effects were reported in 121 (4.7%).

Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

OVERDOSAGE

There is no experience in humans with overdosage. Acute oral toxicity studies in animals, however, using doses up to 12 gm/kg body weight, could not find a lethal dose. Risks associated with overdosage should, therefore, be minimal.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm tablets are supplied in bottles of 100 (NDC 0088-1712-47) and in Unit Dose Identification Packs of 100 (NDC 0088-1712-49). Light pink scored oblong tablets are embossed with CARAFATE on one side and 1712 bracketed by C's on the other.

Physician Procedures

Plastic Surgeon Publishes Photographs of Patient; School Physician Not Liable for Evaluation of Student; Court Increases Claimants' Rights; Wrongful-Death Recovery is Denied

PLASTIC SURGEON PUBLISHES PHOTOGRAPHS OF PATIENT RESULTING IN \$10,000 VERDICT

An action was brought against the defendant plastic surgeon who performed cosmetic surgery on a 19-year-old female plaintiff's face to correct a protrusion on her nose. Seven years following the procedure, the defendant physician showed "before and after" facial photographs of the plaintiff on a cable television program. The plaintiff alleged that the defendant breached his duty to maintain the physician/patient confidentiality in publishing the photographs without her consent.

The defendant countered that the plaintiff consented to have the photographs utilized by the defendant for teaching and educational purposes, and in support of this assertion, offered a written consent form signed by the plaintiff at the time of treatment authorizing such use.

The plaintiff contended that the consent form offered into evidence by the defendant did not contemplate the use of the pictures on a public television station broadcast to more than one million homes, and offered the expert testimony of a professor of medical ethics to support this assertion.

On cross-examination, the defendant physician admitted in retrospect, he should have obtained a more specific consent for this type of use.

The plaintiff alleged that she suffered a post-traumatic stress disorder as a result of the publication, as testified to by an expert examining psychiatrist. Specifically, this expert related that the manifestations of the disorder are depression, shame, and anger, which would necessitate management with medication.

The defendant offered countering expert testimony from an examining psychiatrist who maintained that the plaintiff was a young, healthy woman who had not sustained any psychiatric residual as a result of the subject incident.

The court directed a verdict in favor of the plaintiff on the issue of liability at the close of all the evidence. The jury returned a verdict of \$10,000. (*New Jersey Verdict Review and Analysis*, Volume 9, Issue 3, July 1988)

SCHOOL PHYSICIAN NOT LIABLE FOR EVALUATION OF STUDENT

A school physician who found that a junior high school student was not physiologically mature enough for a senior high school tennis team was not liable for medical malpractice or for negligent infliction of emotional distress, a New York appellate court ruled.

Local boards of education could permit junior high school students to compete on senior high school teams, provided they were placed at levels of competition appropriate to their physiological maturity. The level of maturity was to be determined by the school physician according to guidelines established by the New York State Education Department.

The physician, using the recommended screening procedures, found that the student was not sufficiently mature to try out for the tennis team. The student brought an action against the physician and the school district. He alleged that he had been subjected to great humiliation, embarrassment, and scorn, and had suffered mental and physical distress. He contended that the physician had negligently failed to exercise reasonable judgment and had failed to follow proper medical practice in evaluating his level of physiological maturity.

The physician and the district moved for summary judgment on the grounds that the complaint failed to state a cause of action. The trial court denied the motions, stating that there were factual issues in this case.

On appeal, the student contended that he had a cause of action for negligent infliction of emotional distress and medical malpractice. The court said the complaint alleged that, because of an incorrect determination of the student's maturity, he was improperly excluded from trying out for the team. The court said that this amounted to educational malpractice, which was not recognized in the courts of the state.

As far as the complaint alleged a cause of action for medical malpractice, the court said that the physician owed the student no duty other than to administer the screening test properly. Since there was no allegation that this was not done, the court said that the physician had not breached the duty. The court reversed the lower court's judgment. (Reprinted from *The Citation* with permission, American Medical Association, 535 N. Dearborn Street, Chicago, IL 60610, May 1, 1988, Volume 57, No. 2)

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department and Director of Special Projects, respectively.

COURT INCREASES CLAIMANTS' RIGHTS IN MALPRACTICE

The New Jersey State Supreme Court has ruled that even if a patient is partially to blame for an illness or complication, she still may recover damages in a malpractice case.

The legal dispute centered on the health problems of a woman who was a diabetic and lost her leg when gangrene set in after minor surgery was performed to remove part of a problem toenail.

The jury found that while the defendant physician acted negligently by removing the toenail without adequately considering the plaintiff's other serious health problems, the patient was more at fault for maintaining poor health practices.

Evidence was presented at the trial that during the period before the surgery, the plaintiff did not follow the physician's instructions to quit smoking, or to maintain her weight, blood sugar, and diet at acceptable levels.

The jury found that the plaintiff was 51 percent at fault, while the physician was 49 percent at fault, and therefore she was not entitled to receive any damages.

Under New Jersey law, a victim who is more than 50 percent responsible for an injury is ineligible to receive damages.

However, the Supreme Court ruled such a blanket denial of damages to patients who may be largely at fault for their own complications is unfair. (*The Times*, August 12, 1988)

WRONGFUL-DEATH RECOVERY IS DENIED

Parents may not recover wrongful-death damages when a child is stillborn, the New Jersey Supreme Court ruled recently in the case of a New Providence couple.

The court, in a 6-0 decision, fell back on a long-standing definition of a fetus as being part of its mother and not a separate person, and ruled an unborn child does not have the same legal rights as one that is born alive.

Statute and precedent suggest that "the traditional definition of 'person' under the (wrongful-death) act

be retained," Justice Alan B. Handler wrote for the court. "We are persuaded ultimately because we find no compelling underlying policy that would impel us to give the statutory term 'person' an expansive interpretation."

Lawyers for the defendant physician had argued that a decision for the couple would open a floodgate of wrongful-death lawsuits by parents of "viable" fetuses. Those who support abortion also said a wrongful-death ruling could have armed abortion foes in their battle for legal recognition of fetuses.

The high court ruled that parents are entitled to sue only for their own mental distress and suffering.

In oral arguments before the court last May, the plaintiff's attorney said he and the couple wanted "to have the fetus recognized as a person."

He said the parents wanted the law expanded so parents who lose a child before birth could sue for the same kind of damages that parents of a living child could.

The couple sued in 1985, two years after their baby was stillborn. They claimed the physician erred by refusing to perform a caesarean section with the birth more than two weeks overdue and the mother experiencing intermittent pain and contractions.

Their suit sought damages for the infant's "conscious pain and suffering," but asked for no compensation on behalf of the plaintiffs themselves.

The case was dismissed a year later, and the Appellate Division of Superior Court affirmed the dismissal.

The defendant's attorney said a ruling for the couple would have opened a Pandora's box for judges and medical specialists. Among other difficult issues, he said it would leave courts to determine at what point a fetus becomes a separate person and whether one's death is due to trauma, like a car accident, or to biological causes.

Wrongful-death suits on behalf of fetuses have not been allowed in New Jersey since 1964, when the Supreme Court ruled against a pregnant woman who lost her fetus in an automobile accident. (*The Times*, August 11, 1988)

The first step in helping someone fight alcohol or drug addiction begins with family and friends.

The person suffering often denies there's a problem. And may do almost anything to hide from the facts.

That's why it's up to you.

If someone you care about is dependent on alcohol or drugs, don't wait. Call the Carrier Foundation today.

When you call Carrier, you're helping someone you love take the first step toward freedom from addiction.

And it's possible to take this step and receive treatment without leaving home or work.

Carrier outpatients receive a complete medical evaluation and attend three or more sessions a week of individual, group and family therapy.

And all this is provided in the strictest confidence.

So if someone you know needs help in overcoming dependency on alcohol and drugs, call Carrier today at 1-800-223-0207. Outside New Jersey, call 1-201-874-4000.

YOCON®

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubiaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

MSNJ COMMITTEE ON UTILIZATION REVIEW SYSTEMS Review Certification

Insurance companies have become more and more aggressive in their precertification and concurrent review policies. In order to ascertain the status, Robert J. Weierman, M.D., chairman of the Committee on Utilization Review Systems, contacted the Departments of Health and Insurance to determine just who—besides our regular PRO/URO contractors—are able to do this. He noted that the Department of Insurance, state of New Jersey, has approved five insurance companies to do preadmission and concurrent review certification: Prudential Insurance Company, New Jersey Blue Cross, Provident Life and Accident, Connecticut General Life Insurance Company, and Home Life Insurance Company.

All other approvals for New Jersey-based companies have been on hold since July 1985, when the Department of Insurance imposed a moratorium. These companies are approved to do review for purposes of payment by the insurance company. The five certified UROs currently in the state of New Jersey perform reviews for purposes of hospital billing. A problem does occur when the insurance carrier refuses to recognize the certified URO or delegated hospital determination.

In essence, two avenues of approach can be taken. One would be to send a letter to the nonapproved insurance company which is attempting to get concurrent information; this would be on your letterhead. Suggested format follows:

Re: Patient's Name
Hospital: Hospital Name
Admission: Date
Contract: Number (if relevant)

Attached for your information is a copy of the New Jersey Department of Health memorandum of July 1987, which states in part: "It is the policy of the Department of Health that, for purposes of acute care hospital reimbursement, only the State Certified Utilization Review Organizations (UROs) have binding authority in utilization review determinations, i.e. length of stay and medical necessity denials."

We have been informed that an unofficial review of the above-mentioned patient's hospitalization

has been conducted. This unofficial review generally has no effect on the bill; however, this hospitalization has been reviewed and legally certified by the URO.

To sustain the integrity of New Jersey's cost-containment program, employers and/or insurers are urged to contract directly with a certified URO for all review services in New Jersey for any additional review, monitoring, or date of services that are of interest. Inquiries regarding URO certification can be forwarded to the New Jersey Department of Health. We request that you direct all other questions and requests concerning utilization review matters to the URO.

Sincerely yours,

Copies to: New Jersey Department of Health
John Fitch Plaza, CN-360
Trenton, New Jersey 08625
New Jersey Department of Insurance
201 East State Street, CN-325
Trenton, New Jersey 08625

Another alternative would be to send a copy of the New Jersey Department of Health memorandum calling attention to the third paragraph which states: "Hospitals are encouraged and may (but are not obligated to) provide utilization information to payor or payor agents." This could be sent to the insurance company with a request to contact Bernice Ferguson, 609/292-0086.

HEART, LUNG, AND BLOOD INSTITUTE Hypertension

The 1988 Report of the Joint National Committee on Detection, Evaluation, and Treatment of High Blood Pressure is available from the National Heart, Lung, and Blood Institute (NHLBI). The report was released by the coordinating committee of the National High Blood Pressure Education Program, a program sponsored by the NHLBI. This represents the fourth in a series of reports which have provided physicians and other health professionals with updated therapy recommendations for more than a decade.

This report reviews, updates, and expands the 1984 recommendations for controlling hypertension. The new report translates the results of the latest clinical trials to medical practice; addresses the needs of

PRESIDENT'S HOT-LINE

Palma E. Formica, M.D.

★ **Special Assessment.** I have received a number of letters from members who are opposed to the \$100 special assessment mandated by the House of Delegates to fund special public relations activities. We can grant exemptions for financial hardship. We cannot grant exemptions to conscientious objectors.

★ **Nursing Shortage.** The nursing and technician shortage is a concern for all physicians. In order to enhance our communication with nurses, the Board of Trustees has extended an invitation to the president and executive director of the New Jersey State Nurses Association to attend our meetings.

★ **Licensing Reform Legislation.** Senator Codey has introduced a legislative proposal to amend and to improve the physician licensing system in New Jersey. While the Senator initiated this project as a result of the SCI report on impairment, we believe a fair and effective program will develop through the efforts of the Society and Judge Herbert J. Stern.

★ **Malpractice Reinsurance Surcharge.** The insurance commissioner has filed a proposed regulation

that places a 6 percent surcharge on the malpractice policies of all physicians for the next seven years. The surcharge is intended to offset a \$45 million deficit caused by 3,500 physicians and podiatrists insured by the Reinsurance Association from 1977 through 1982. Those individuals made conscious and voluntary choices to insure with the state. They did not purchase subordinated loan certificates and actually paid lower rates. The Society does not accept the commissioner's position that insureds other than those directly involved should pay the surcharge.

★ **Consultants to the SBME.** The Board has agreed to develop a list of experts to assist in peer review for the State Board of Medical Examiners.

★ **Physical Therapy Regulation.** The State Board of Medical Examiners has proposed a regulation to prevent physicians from employing physical therapists or having an interest in a physical therapy practice. The Society has filed comments in opposition, and will vigorously oppose adoption of this illegal and anti-competitive proposal.

special populations; examines factors that influence the cost of care; and provides additional guidelines for managing high blood pressure in the presence of cardiovascular diseases and other coexisting medical conditions. It is intended as a guide for practicing physicians and other health professionals in their care of hypertensive patients, and as a reference for those participating in the many community HBP control programs throughout the country.

A copy may be obtained free of charge by contacting: The National High Blood Pressure Education Program Information Center, 4733 Bethesda Avenue, Suite 530, Bethesda, MD 20814.

PHARMACEUTICAL MANUFACTURERS ASSOCIATION (PMA) Drug Samples

Physicians should know that their right to use and distribute drug samples to patients is in no way affected by the new Prescription Drug Marketing Act. Signed into law in April, the main thrust is to establish new requirements affecting the distribution and marketing of prescription drugs. Of specific interest to physicians are the provisions that ban the sale, trade, or purchase of drug samples and require manufacturers distributing pharmaceutical samples to follow certain storage, handling, and accounting procedures.

Criminal penalties were put into effect on July 22, 1988, for anyone who sells, trades, or purchases drug samples. The penalties can be as much as ten years in prison, and up to \$250,000.

The physician needs to keep in mind a few points about this new law:

1. The law does not prevent physicians from receiving or dispensing drug samples.

2. In order to receive samples, physicians are required to sign a written request form verifying the identity of the drug and the quantity requested. This part of the law becomes effective October 20, 1988.

This written request form is required by some states and already is commonly used by manufacturers.

3. Although the law does not require physicians to maintain inventory records, manufacturers may ask physicians for their help in assuring that they did receive the samples requested. While the new law does not mandate physicians to cooperate with this verification procedure, the law does encourage manufacturers to implement such a system.

The Pharmaceutical Manufacturers Association and the American Medical Association convinced Congress that the initial proposals to ban samples would hamper efforts to provide quality medical care.

Samples allow the physician to evaluate a specific drug to ensure the patient tolerates it and to determine if the drug has the desired effect. Samples also permit the physician to begin therapy immediately, which can be very important in some cases, especially in rural areas.

The legislation that was passed does not threaten the practice of sampling, but does help safeguard the integrity of prescription drugs distributed in this manner. Many of the procedural requirements imposed on manufacturers have long been established policies for PMA member companies.

Physicians and patients value drug samples, according to surveys, and believe the practice of sampling should continue. PMA and its member companies also believe in the value of sampling, and we will work to implement this new law smoothly so that samples can continue to play a useful role in patient care.

1989 MSNJ Annual Meeting

The Board of Trustees of the Medical Society of New Jersey at its September 18, 1988, meeting, approved the Committee on Annual Meeting recommendation that the 1989 Annual Meeting be held at the Sheraton Meadowlands Hotel in East Rutherford, on Thursday, April 27, through Sunday, April 30, 1989.

The daily schedule follows:

Wednesday, April 26, 1989

3:30 P.M. Board of Trustees' Meeting

Thursday, April 27, 1989

8:00 A.M. Registration Opens

8:00 A.M. Message Center Opens

10:00 A.M. House of Delegates

1:00 P.M. Program—Topic of Major Interest to Physicians

1:00 P.M. Exhibits Open

3:30 P.M. Reference Committee Meetings

Friday, April 28, 1989

8:00 A.M. Registration Opens

8:00 A.M. Message Center Opens

8:30 A.M. Exhibits Open

9:00 A.M. House of Delegates (Election)

12:00 NOON Golden Merit Award Ceremony and Reception

2:30 P.M. Reference Committee Meetings

5:00 P.M. JEMPAC Political Forum

Friday, April 28, 1989

5:45 P.M. JEMPAC Wine and Cheese Reception

6:30 P.M. Middlesex County Medical Society Reception

Saturday, April 29, 1989

8:00 A.M. Registration Opens

8:00 A.M. Message Center Opens

8:30 A.M. Exhibits Open

9:00 A.M. House of Delegates

1:30 P.M. House of Delegates

2:00 P.M. Exhibits Close

6:00 P.M. Inaugural Reception and Dinner

Sunday, April 30, 1989

8:00 A.M. Registration Opens

8:00 A.M. Message Center Opens

8:30 A.M. General Session—Topic of Major Interest to Physicians

1:00 P.M. Board of Trustees' Meeting

The daily schedule for Thursday, April 27 has been revised. Changes include the scheduling of the House of Delegates opening session at 10:00 A.M. on Thursday, April 27, 1989, and an educational program from 1:00 P.M. to 3:00 P.M., that same day.

The topics for the education programs scheduled for 1:00 P.M., Thursday, April 27, and 8:30 A.M., Sunday, April 30 will be announced at a later date.

The Inaugural Reception and Dinner-Dance honoring President-Elect Paul J. Hirsch, M.D., will be held on Saturday, April 29, 1989.

munization education program. An adult immunization education program will be added to the previously established child immunization education program.

Kimberly Updegove, formerly a research consultant for the Office of Health Policy Analysis at HRET, will be coordinating the program with Rita Clement, program director, Health Promotion. They will be developing educational brochures and posters to distribute to hospital and community health services programs. The goal of these educational tools is to raise the consciousness of both health care providers and the public about the need for adult immunization and to dispel the myth that "childhood" diseases present a danger only to children.

For more information, call the education department at HRET (609/275-4111), Kim Updegove (609/275-4114), or Rita Clement (609/275-4029).

MESSAGE FROM SENATOR BRADLEY Catastrophic Health Care

In June, Congress passed the Medicare Catastrophic Protection Act which makes major improvements in Medicare's coverage of hospital and doctor bills. In 1989, Medicare will pay an entire year's hospital bills

after the patient pays for just the first day of a hospital stay. In 1990, Medicare will pay all covered doctor bills over \$1400 a year. And, by 1992, Medicare will pay for most of the costs of prescription drugs after the patient pays \$600 a year.

This new program will be financed by two premiums—a basic premium of \$60 a year paid by all Medicare beneficiaries (except the poor) and a supplemental premium, ranging from \$23 to \$800 a year, depending on a person's income.

Another part of the legislation will increase home care services to 38 days (or longer if a physician says that additional services are needed).

A second provision will help families who want to care for parents and older relatives in their homes. This respite care program would give family members a short break from the day-to-day tasks of caregiving by allowing up to 80 hours a year of in-home services, including companion services and homemaker/home health aide services.

LEGISLATIVE UPDATE

Status of Legislation on Which MSNJ Has Taken an Active Position

Bill	Subject	MSNJ Position	Committee	Present Status
S-216 O'Connor	Creates a separate licensing and regulatory board for chiropractic.	Active Opposition	Senate: LIP	Out of committee; 2nd reading
S-219 O'Connor	Provides for the licensing and regulation of nutritionists through a Board of Nutrition within the Department of Law and Public Safety.	Active Opposition	Senate: LIP	In committee
S-263 Dumont	Provides for a three-year statute of limitations, except for fraud, intentional concealment, or nontherapeutic or diagnostic purpose. Minors would have until age 11 on any injury prior to age 8.	Active Support	Senate: JUD	In committee
S-470 Bubba	Requires physicians to personally present and obtain surgical consent forms and signatures. The form shall state the name of any assisting physician that performs surgery under the supervision of the attending.	Active Opposition	Senate: LIP	In committee
S-718 Codey	Amends the certificate of need to include physicians whenever a health service has been regionalized by regulation of the Department of Health. Regulation would terminate within three years, at which time, the commissioner could readopt the regulation.	Active Opposition	Senate: IHW	In committee
S-784 McManimon	Allows psychologists to certify disability.	Active Opposition	Senate: LIP	Passed in Senate; in Assembly committee (Labor)
S-1018 Lipman	Authorizes nurses to practice medicine and to prescribe drugs and devices.	Active Opposition	Senate: LIP	In committee
S-1062 DiFrancesco	Requires every person who has reasonable cause to believe an elderly or disabled person is the victim of abuse or exploitation to report that information to the commissioner of human services or his designee.	Active Support	Senate: IHW	In committee
S-1123 Cardinale	Exempts the private practice of medicine from the certificate of need law.	Active Support	Senate: IHW	In committee
S-1146 Cardinale	Limits noneconomic damage awards to \$100,000.	Active Support	Senate: JUD	In committee
S-1153 Cardinale	Requires that alcoholic beverages be labeled to advise pregnant women of potential harm to fetus when consumed.	Active Support	Senate: IHW	In committee
S-1188 Feldman	Provides that within 60 days of filing an action against a physician, the plaintiff must provide an affidavit from an expert that there has been a negligent deviation from the accepted standards of practice.	Active Support	Senate: JUD	In committee

Bill	Subject	MSNJ Position	Committee	Present Status
S-1205 Feldman	Makes the decision of an administrative law judge final in contested agency actions.	Active Support	Senate: JUD	In committee
S-1208 Feldman	This bill would establish and license two categories of social workers and would create a Board of Social Work Examiners in the Department of Law and Public Safety whose powers and duties, among others, would be to administer the act, examine and license candidates for the various categories of social work, and promulgate rules and regulations necessary for the effective enforcement of the act. The two categories of licensed social work would be (1) social work specialist, who would be required to have a doctorate in social work or a master's degree from an accredited school of social work and (2) social workers who would need a baccalaureate degree from an accredited college or university social work or social welfare program. The bill would "grandfather" in all persons currently in practice, provided they have been in practice in one of the two licensed categories for two of the last five years, and apply to be licensed within 180 days from the effective date of this act.	Active Opposition	Senate: IHW	Passed in Senate; in Assembly committee (HERP)
S-1252 Contillo	Provides for a nonbinding referendum concerning the enactment of a national health plan.	Active Opposition	Senate: IHW	Passed in Senate; in Assembly committee (HHR)
S-1491 Gagliano	Prohibits the licensing and/or practice of physician assistants.	Active Support	Senate: IHW	In committee
S-1541 Pallone	Requires food and hydration to be provided to all patients regardless of consent; does not provide immunity to health professions nor is a penalty for nonobservance provided.	Active Opposition	Senate: IHW	In committee
S-1649 Orechio	Requires health care licensees to accept Medicare determination of their fees.	Active Opposition	Senate: IHW	In committee
S-1705 Bassano	Eliminates joint and several liability.	Active Support	Senate: JUD	In committee
S-1845 Lesniak	Provides for structured payments in civil actions against health care providers when future damages exceed \$250,000. An annuity contract must be offered to guarantee payments.	Active Support	Senate: JUD	Out of committee; 2nd reading
S-2055 VanWagner	Creates a study commission to determine whether the DRG program should be continued.	Active Support	Senate: IHW	In committee
S-2509 Lynch	Provides that physicians, chiropractors, and podiatrists may not use unlicensed aides to provide physical modalities.	Active Opposition	Senate: LIP	In committee

Bill	Subject	MSNJ Position	Committee	Present Status
S-2592 DiFrancesco	Provides for the licensing and regulation of occupational therapy.	Active Opposition	Senate: LIP	In committee
A-88 Villane	This bill would establish and license two categories of social workers and would create a Board of Social Work Examiners in the Department of Law and Public Safety whose powers and duties, among others, would be to administer the act, examine and license candidates for the various categories of social work, and promulgate rules and regulations necessary for the effective enforcement of the act. The two categories of licensed social work would be (1) social work specialists, who would be required to have a doctorate in social work or a master's degree from an accredited school of social work and (2) social workers who would need a baccalaureate degree from an accredited college or university social work or social welfare program. The bill would "grandfather" in all persons currently in practice, provided they have been in practice in one of the two licensed categories for two of the last five years and apply to be licensed within 180 days from the effective date of this act.	Active Opposition	Assembly: HERP	In committee
A-148 Penn	Permits psychologists to certify disability under the temporary disability benefits law.	Active Opposition	Assembly: L	In committee
A-420 Deverin	Creates a new class of licensed practitioners who would function independently and would be permitted to perform such services as the design, fabrication, and application of splints, sensorimotor activities, the use of specifically designed crafts, guidance in the selection and use of adaptive equipment, therapeutic activities to enhance functional performance; prevocational evaluation and training, and consultation concerning the adoption of physical environments for the handicapped. The State Board of Medical Examiners will exercise jurisdiction.	Active Opposition	Assembly: HERP	In committee

Senate Reference Committees

LIP: Labor, Industry, and Professions
SGF&IR&VA: State Government, Federal & Interstate Relations & Veterans Affairs
IHW: Institutions, Health & Welfare
JUD: Judiciary
RFA: Revenue, Finance & Appropriations

THE LOWER RESPIRATORY TRACT— More vulnerable to infection in smokers and older adults

Experience counts

Ceclor[®] Pulvules[®]
250 mg
cefaclor
think of it first

For respiratory tract infections due to susceptible strains of indicated organisms.

Summary.
Consult the package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A β -hemolytic streptococci).

Contraindication: Known allergy to cephalosporins.

Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS. Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in

moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.

- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.

- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] and toxic epidermal necrolysis or the above skin manifestations accompanied by arthritis/arthritis, and frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.

- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.

- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.

- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.

- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%, and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology

- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest[®] tablets but not with Tes-Tape[®] (glucose enzymatic test strip, Lilly).

INTENSIVE CARE.

Your practice deserves nothing less. And the Medical/Dental Banking Group at Midlantic National Bank/North is uniquely prepared to deliver the kind you need.

Whether you're a third-year resident or long-established in practice, a personalized loan package may be the best prescription for your future. We know the funding needs of new practices, buy-ins, buy-outs and practice expansion may exceed the lending limits of most financing sources. This is why we finance creatively, based on an understanding of medical economics and a repayment plan based on anticipated practice growth rather than fixed schedules.

We speak your language in other areas as well, with practice and personal services such as checking, savings, trust and estate planning, IRAs, custodial accounts, and more.

If you're starting out, start with our free brochure, "The Beginning Physician's Guide to Financing a Practice." Beginner or not, we urge you to call Patrick Robinson, Vice President and Group Manager, toll-free at 1-800-633-0040.

We'd like to make a "house call," and show you how our intensive care can help your practice.

Mixed Signals from Physical Therapists; AIDS Warning for Funeral Directors; Financial Disclosure Bill; Fight Against Malpractice Surcharge; Involuntary Commitment Law Delayed

MIXED SIGNALS FROM PHYSICAL THERAPISTS

Can somebody please tell us what the Physical Therapy Association really wants? Try this multiple choice:

- a. A law which requires physicians to employ physical therapists in order to provide "physical modalities."
- b. A regulation prohibiting physical therapists from being employed by physicians.
- c. Both of the above.

The correct answer is "c." Never mind that the goals seemingly are mutually exclusive.

Readers of this column may be familiar with answer "a." The physical therapists have had identical bills, S-2509 and A-3166, introduced to prohibit physicians from using any employee, other than a physical therapist, to administer "physical modalities." These include heat, diathermy, cold, ultrasound, ultraviolet rays, cold quartz rays, and electromagnetic rays.

What's new is answer "b." The State Board of Physical Therapy now has proposed a rule which would prohibit PTs from being employed by physicians or physician-owned facilities. The Board's justification for this astonishing proposal is as follows:

"The Board is seeking to address what it perceives as a growing trend in the health care system of having physical therapy services delivered by therapists who are in the employ of, or otherwise indebted to, persons who possess the capacity to authorize the initiation of treatment. Such arrangements, the Board believes, permit the referrers to derive a profit from physical therapy services without allowing consumers to know where their health care dollar is going.

(Note: The foregoing argument will be made invalid by the enactment of the financial disclosure bill described later in this column.)

"In addition, in such situations it is impossible to ascertain the actual cost of the physical therapy services. Employment arrangements wherein the licensee is paid for his or her services by the referring practitioner would be prohibited based upon the Board's belief that such arrangements lead to a compromise of the physical therapist's professional judgment and denial of the patient's freedom of choice. A patient usually is not in a position to shop for physical therapy services, and must rely on both the referrer and the therapist for unbiased recommendations and guidance."

As an aside, the rule also would classify as "professional misconduct" the rendering of treatment by a PT when "the physical therapist may deem such treatment to be unnecessary, even if he or she has received direction from a physician."

The Society is convinced that the PT Board has strayed far beyond its statutory authority in proposing this rule, and we've registered our objections with the attorney general and Division of Consumer Affairs.

It also is interesting to note that the Board is attempting to institute a ban which the legislature already has rejected. A bill which would have prohibited physicians from employing PTs or owning facilities which provide physical therapy services failed in the 1986-1987 legislative session.

Going back to our multiple choice question, the correct answer was "both of the above." The physical therapists apparently want a modalities law and an employment regulation which, when combined, would assure that neither physical therapy nor physical modalities could be obtained in the physician's office or facility.

AIDS WARNING FOR FUNERAL DIRECTORS

Governor Thomas Kean has signed a law requiring funeral directors to be notified in writing if a deceased person they are preparing for burial is infected with AIDS or any other contagious, infectious, or communicable disease.

The law, chapter 125 of the laws of 1988, was signed on September 15 and the AIDS notification took effect immediately. In addition, the State Department of Health has until next March to distribute a comprehensive list of "contagious, infectious, or communicable diseases" about which funeral directors should be warned.

The notification burden is on physicians, registered nurses, and medical examiners who pronounce death and know that the deceased person was infected with a relevant disease. Failure to give notification is punishable by a fine of up to \$1,000.

The law also provides health professionals who give notification immunity from civil or criminal liability, as long as they act in good faith.

FINANCIAL DISCLOSURE BILL

A financial disclosure bill, which acknowledges the physician's right to own or invest in health care services, has cleared the Assembly Health Committee and now is pending final passage in the lower house.

*Mr. Martin is MSNJ's legislative consultant.

The bill, S-734/A-2485, applies to practitioners regulated by the Board of Medical Examiners (physicians, podiatrists, and chiropractors). It recognizes that they can own health care services, and requires them to disclose that relationship whenever they refer a patient to a facility in which they or their immediate family have a financial interest.

The bill was conceived as the Society's alternative to lobbying efforts—primarily by physical therapists—aimed at preventing physicians from owning a variety of health care services. It is sponsored by Senators Richard Codey (D—West Orange) and John Russo (D—Toms River) and Assemblyman Chuck Haytaian (R—Hackettstown).

The bill applies to such services as a bioanalytical laboratory, pharmacy, nursing home, home health care agency, and radiological and ophthalmic facilities.

Disclosure is required if the practitioner owns 5 percent or more of the service, or if the investment exceeds \$5,000. Ownership of a building in which space is leased to a health care service need not be disclosed.

FIGHT AGAINST MALPRACTICE SURCHARGE

Round two of the Society's campaign to defeat the Insurance Department's proposed 5 percent annual surcharge on malpractice premiums has been fought, and we're now preparing for the remainder of the bout.

The second round took place in an October 24 public hearing at the Insurance Department. The Society, its county components, and specialty societies had planned an impressive turnout of physicians to demonstrate medicine's deep-seated opposition to the ill-advised surcharge. Our earlier efforts included corresponding with Governor Kean, Insurance Commissioner Ken Merin, and the entire legislature, as well as distributing press releases to the media explaining our position.

The surcharge was proposed by the Insurance Department as a means to make up some \$60 million in liabilities of the Medical Malpractice Reinsurance As-

sociation, a state-run plan which sold underpriced malpractice insurance for six years beginning in 1976.

Although it was warned several times by legitimate insurance carriers that its premiums were too low, the Medical Malpractice Reinsurance Association insisted on selling cheap insurance throughout its years of operation. As a result, it has accumulated an estimated \$22 million in reserves, but faces at least \$82 million in claims over the next decade.

INVOLUNTARY COMMITMENT LAW DELAYED

Implementation of the state's new involuntary civil commitment law will be delayed for a year under terms of a bill (A-3790) introduced by Assemblyman George J. Otlowksi (D—Perth Amboy). The law, sponsored by Assemblyman Otlowksi, is scheduled to take effect this month.

Absent passage of the bill, the law still cannot become operative; too much work remains to be done. A-3790 simply reflects this reality.

The law expands the criteria under which mentally ill adults can be involuntarily committed to psychiatric hospitals. It will permit patients to be hospitalized prior to their committing an overt act which is dangerous to themselves or others. It also establishes hospital-based screening centers where patients can be evaluated for up to 24 hours, as well as short-term psychiatric units in community hospitals to provide acute care for up to two weeks.

While the concept may sound simple, its implementation has proved to be difficult for the Department of Human Services. The law cannot operate effectively until the network of screening centers and short-term care units is established. Because this work still is in its formative stages, the delay is necessary.

The new law is intended to foster better treatment for the acutely mentally ill by shifting responsibility to community hospitals. State and county psychiatric hospitals would function primarily as facilities for treating chronic mental patients.

ARMY RESERVE OFFERS NEW FINANCIAL INCENTIVES FOR RESIDENTS IN ANESTHESIOLOGY AND SURGICAL SPECIALTIES

If you are a resident in Anesthesiology, Orthopaedic Surgery, or General Surgery including Neurosurgery, Colon/Rectal, Cardiac/Thoracic, Pediatric, Peripheral/Vascular and Plastic Surgery, the Army Reserve has a new and exciting opportunity for you. The New Specialized Training Assistance Program will provide you with financial incentives while you're training in one of these specialties.

Here's how the program can work for you. If you qualify, you may be selected to participate in the Specialized Training Assistance Program. You'll serve in a

local Army Reserve medical unit with flexible scheduling so it won't interfere with your residency training, and in addition to your regular monthly Reserve pay, you'll receive a stipend of \$678 a month.

You'll also have the opportunity to practice your specialty for two weeks a year at one of the Army's prestigious Medical Centers.

Find out more about the Army Reserve's new Specialized Training Assistance Program. Call (collect) your U.S. Army Medical Department Reserve Personnel Counselor: **Major Claudia Gibson**

ARMY MEDICINE. BE ALL YOU CAN BE.

PromptCare

"We care . . . about your health"

Attention Hospital Executives and Physicians:

ARE YOU READY TO JOINT VENTURE WITH YOUR MEDICAL STAFF?
ARE YOU READY TO ASSUME ECONOMIC CONTROL OVER YOUR MEDICAL PRACTICE?

ARE YOU READY TO ASSUME CLINICAL LEADERSHIP FOR YOUR PATIENTS DISCHARGED "QUICKER & SICKER" WHO REQUIRE AIDS THERAPY, OXYGEN OR DME?

ARE YOU READY TO JOIN 2,000 NEW JERSEY PHYSICIANS IN GROUP PURCHASING OF MEDICAL AND OFFICE SUPPLIES? DO YOU NEED HELP WITH OFFICE MEDICAL WASTE DISPOSAL?

PromptCare has helped eleven groups of physicians and nineteen hospitals establish their own Home Health Care Equipment and Medical Office Supply companies. No more just signing forms for outsiders without input. No more profits to outsiders for necessary office expenses. No more national firms coming into New Jersey.

If you and your peers are interested, please contact Mr. Michael Garippa, President, at 355-0200 or 1-800-451-0038. As few as 15 physicians can create a new group.

The PromptCare Companies—The largest collective physician effort in NJ business: Summit, Rahway, Elizabeth, Corvas, Plainfield, Ocean, Atlantic, Hudson County, Raritan, Cathedral and Passaic.

Serving All Patients

PALMA E. FORMICA, M.D.

On June 29, 1988, as Dr. James Davis assumed the presidency of the American Medical Association, he challenged physicians to tithe four hours of service a week for the good of the American people. He suggested each of us could contribute to the public good by teaching, becoming involved in community activities, and demonstrating compassion and caring to each individual patient. He urged the leadership of organized medicine to bring this message to all doctors.

Service is a noble part of our vocation as physicians. I am convinced that the members of the Medical Society of New Jersey fulfill this challenge. Thousands of physicians accept both Medicaid and Medicare assignments even when the reimbursement does not cover "turn-key" costs. And we treat patients and the medically indigent with respect and compassion. The state uncompensated care fund reimburses hospitals—not physicians.

Every time we teach students, residents, and patients, we are extending service. Our activities with temples and churches, service organizations, and schools and sports are a means of tithing.

In October, I was invited to a testimonial dinner given by the Cooper Foundation. The award bestowed on Dr. Lindley Reagan of Burlington County honored him for dedicated service to his country, his community, his patients, his family, and his profession. Dr. Reagan epitomizes that covenant of caring which sets physicians apart. It is that other directness which made him become involved in his community for the good of all people. The Cooper award was an example of the other side of the covenant. His peers, his patients, and the community (the Cooper Foundation) recognized his gifts of devotion and service. Each of us can emulate the example of Dr. Lindley Reagan.

Dr. Formica and Dr. Reagan

I believe our physicians are generous with their gifts of service. Every time I see a doctor's curriculum vitae, I am impressed by the depth and breadth of activities. Many are involved in philanthropic and charitable works in the arts and humanities, with religious organizations, with health planning, with hospital fundraising, and with lectures to special groups such as seniors, AIDS victims, and teenagers.

I urge our younger physicians to be involved. In the thrust of establishing a practice, we should not overlook service to others. Generosity and altruism have their own reward—the impression made by dedication is never lost.

Will we meet the challenge of Dr. Davis?

**"Medical training taught
me how to cure.
Senior Patient helps
me to care."**

Introducing a new "how to" publication for treating senior patients.

Senior Patient provides practical information designed to help you manage the care of your senior patients.

Its fresh approach in medical journalism presents short, easy-to-read, original articles on a broad range of subjects including emotions and coping, family relationships, death and dying, sleep disorders, community services, relations with institutions, and financial problems and their relation to health.

Each issue also offers "Pearls" from the personal experiences of other physicians, "Quick Currents" about what is happening in legislation relating to senior care, and an "Open Forum" in which readers can react and interact.

It's a concise, informative, "how to" approach in caring.

Senior Patient • 4530 W. 77th St. • Minneapolis, MN 55435 • (612) 835-3222

The Health of our State

HOWARD D. SLOBODIEN, M.D.*

Most environmental problems are caused by pollution from occupational sources, such as the discharge of industrial wastes, accidentally or otherwise, into potentially hazardous areas.

Radon poses a different problem. It is a naturally occurring "inert" gas, but it presents a serious danger to public and personal health. Radon is the second leading cause of lung cancer, responsible for about 20,000 deaths annually in the United States. Governmental groups are showing increasing concerns. The New Jersey State Department of Environmental Protection warned of the toxic effects of radon more than a year ago. The federal government sounded an alert two months ago. The New Jersey legislature is considering tying real estate transfers to mandatory testing for radon. This draconian proposal should not be necessary; people should be anxious to practice a little preventive medicine that does not require the extreme sacrifice of changing one's lifestyle. Although there are radon belts, the gas can be present outside these regions; radon has many skip areas. New Jersey citizens should give priority to testing their homes for radon.

This issue is devoted to the occupational and environmental health of New Jersey, including the problems posed by radon. The October 1988 issue of *NEW JERSEY MEDICINE* (page 783) highlights the state Radon Outreach Program. The life you save may very well be your own, or that of your child.

Occupational health, which deals with the reciprocal influences of the workforce and of health and which forms part of the broad subject of "environmental health," has a history that can be traced back to prehistoric times, e.g. the "cave-gout" of the neolithic man.

Hippocrates wrote of environment and health and described lead colic in a metal extractor. Pliny told of poisoning by lead and mercury.

Further contributions were made to the understanding of mining risks by Agricola and by Paracelsus, both in the 16th century. Many others added their observations.

But Bernardino Ramazzini (1633-1714) generally is acknowledged to be the father of occupational medicine. In *De morbis artificum deatriba* he documented illnesses related to dozens of trades, including those of stone masons, potters, printers, and miners. In addition, he was an excellent epidemiologist, describing such plagues as the malarial epidemics in the area. He has been honored in Europe, America, and, interestingly, in Keio, Japan, where his statue can be seen at the University of Occupational and Environmental Health.

*Correspondence may be addressed to Dr. Slobodien, Editor-in-Chief, *NEW JERSEY MEDICINE*, Two Princess Road, Lawrenceville, NJ 08648.

LEVOXINE®

(LEVOTHYROXINE SODIUM TABLETS, USP)

FOR ORAL ADMINISTRATION

DESCRIPTION:

Each LEVOXINE (Levothyroxine Sodium, USP) tablet contains synthetic crystalline levothyroxine sodium (L-thyroxine). L-thyroxine is the principal hormone secreted by the normal thyroid gland. Chemically, L-thyroxine is designated as L-tyrosine, O-(4-hydroxy-3, 5-diiodophenyl) - 3,5-diiodo-L-tyrosine, O-salt, hydrate. The molecular formula is $C_{15}H_{10}I_4NNaO_4$ and the structural formula is:

CLINICAL PHARMACOLOGY:

The principal effect of thyroid hormones is to increase the metabolic rate of body tissues.

The thyroid hormones are also concerned with growth and development of tissues in the young.

The major thyroid hormones are L-thyroxine (T_4) and L-triiodothyronine (T_3). The amounts of T_4 and T_3 released from the normally functioning thyroid gland are regulated by the amount of thyrotropin (TSH) secreted from the anterior pituitary gland. T_4 is the major component of normal thyroid gland excretions and is therefore the primary determinant of normal thyroid functions. T_4 acts as a substrate for physiologic deiodination to T_3 in the peripheral tissues. The physiologic effects of thyroid hormones are mediated at the cellular level primarily by T_3 .

LEVOXINE (L-thyroxine) tablets taken orally provide T_4 which upon absorption can not be distinguished from T_4 that is secreted endogenously.

INDICATIONS AND USAGE:

LEVOXINE (L-thyroxine) tablets are indicated as replacement or supplemental therapy for diminished or absent thyroid function (e.g., cretinism, myxedema, nontoxic goiter or hypothyroidism generally, including the hypothyroid state in children, in pregnancy and in the elderly) resulting from functional deficiency, primary atrophy, from partial or complete absence of the gland or from the effects of surgery, radiation or antithyroid agents. Therapy must be maintained continuously to control the symptoms of hypothyroidism.

CONTRAINDICATIONS:

L-thyroxine therapy is contraindicated in thyrotoxicosis, acute myocardial infarction and uncorrected adrenal insufficiency.

WARNINGS:

Drugs with thyroid hormone activity, alone or together with other therapeutic agents, have been used for the treatment of obesity. In euthyroid patients, doses within the range of daily hormonal requirements are ineffective for weight reduction. Larger doses may produce serious or even life-threatening manifestations of toxicity, particularly when given in association with sympathomimetic amines such as those used for their anorectic effects.

PRECAUTIONS:

General — Caution must be exercised in the administration of this drug to patients with cardiovascular disease. Development of chest pains or other aggravation of the cardiovascular disease requires a reduction of dosage.

Information For The Patient — Patients on thyroid preparations and parents of children on thyroid therapy should be informed that:

1. Replacement therapy is to be taken essentially for life, with the exception of cases of transient hypothyroidism, usually associated with thyroiditis, and in those patients receiving a therapeutic trial of the drug.
2. They should immediately report during the course of therapy any signs or symptoms of thyroid hormone toxicity, e.g., chest pain, increased pulse rate, palpitations, excessive sweating, heat intolerance, nervousness, or any other unusual event.
3. In case of concomitant diabetes mellitus, the daily dosage of antidiabetic medication may need readjustment as thyroid hormone replacement is achieved. If thyroid medication is stopped, a downward readjustment of the dosage of insulin or oral hypoglycemic agent may be necessary to avoid hypoglycemia. At all times, close monitoring of urinary glucose levels is mandatory in such patients.
4. In case of concomitant oral anticoagulant therapy, the prothrombin time should be measured frequently to determine if the dosage of oral anticoagulants is to be readjusted.
5. Partial loss of hair may be experienced by children in the first few months of thyroid therapy, but this is usually a transient phenomenon and later recovery is usually the rule.

Laboratory Tests — The patient's response to thyroid replacement may be followed by laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels.

Drug Interactions — In patients with diabetes mellitus, addition of thyroid hormone therapy may cause an increase in the required dosage of insulin or oral hypoglycemic agents. Therefore, patients with diabetes mellitus should be observed closely for possible changes in antidiabetic drug dosage requirements.

Patients stabilized on oral anticoagulants who are found to require thyroid replacement therapy should be watched very closely when therapy is started. If a patient is truly hypothyroid, it is likely that a reduction in anticoagulant dosage will be required. No special precautions appear to be necessary when oral anticoagulant therapy is begun in a patient already stabilized on maintenance thyroid replacement therapy.

Cholestyramine binds both T_4 and T_3 in the intestine, thus impairing absorption of these thyroid hormones. In vitro studies indicate that the binding is not easily removed. Therefore, four to five hours should elapse between administration of cholestyramine and thyroid hormones.

Estrogens tend to increase serum thyroxine-binding globulin (TBG). In a patient with a non-functioning thyroid gland who is receiving thyroid replacement therapy, free thyroxine may be decreased when estrogens are started thus increasing thyroid requirements. However, if the patient's thyroid gland has sufficient function the decreased free thyroxine will result in a compensatory increase in thyroxine output by the thyroid. Therefore, patients without a functioning thyroid gland who are on thyroid replacement therapy may need to increase their thyroid dose if estrogens or estrogen containing oral contraceptives are given.

Drug/Laboratory Test Interactions — The following drugs or moieties are known to interfere with laboratory tests performed on patients taking thyroid hormone: androgens, corticosteroids, estrogens, oral contraceptives containing estrogens, iodine-containing preparations, and the numerous preparations containing salicylates.

1. Changes in TBG concentration should be taken into consideration in the interpretation of T_4 and T_3 values. In such cases, the unbound (free) hormone should be measured. Pregnancy, estrogens, and estrogen-containing oral contraceptives increase TBG concentrations. TBG may also be increased during infectious hepatitis. Decreases in TBG concentrations are observed in nephrosis, acromegaly, and after androgen or corticosteroid therapy. Familial hyper- or hypo-thyroxine-binding-globulinemias have been described. The incidence of TBG deficiency approximates 1 in 9000. The binding of thyroxine by thyroid-binding prealbumin (TBPA) is inhibited by salicylates.

2. Medical or dietary iodine interferes with all in vivo tests of radio-iodine uptake, producing low uptakes which may not be reflective of a true decrease in hormone synthesis.

3. The persistence of clinical and laboratory evidence of hypothyroidism in spite of adequate dosage replacement indicates either poor patient compliance, poor absorption, excessive fecal loss, or inactivity of the preparation. Intracellular resistance to thyroid hormone is quite rare.

Carcinogenesis, Mutagenesis, And Impairment

Of Fertility — A reportedly apparent association between prolonged thyroid therapy and breast cancer has not been confirmed and patients on thyroid for established indications should not discontinue therapy. No confirmatory long-term studies in animals have been performed to evaluate carcinogenic potential, mutagenicity, or impairment of fertility in either males or females.

Pregnancy — Category A — Thyroid hormones do not readily cross the placental barrier. The clinical experience to date does not indicate any adverse effect on fetuses when thyroid hormones are administered to pregnant women. On the basis of current knowledge, thyroid replacement therapy to hypothyroid women should not be discontinued during pregnancy.

Nursing Mothers — Minimal amounts of thyroid hormones are excreted in human milk. Thyroid is not associated with serious adverse reactions and does not have a known tumorigenic potential. However, caution should be exercised when thyroid is administered to a nursing woman.

Pediatric Use — Pregnant mothers provide little or no thyroid hormone to the fetus. The incidence of congenital hypothyroidism is relatively high (1:4,000) and the hypothyroid fetus would not derive any benefit from the small amounts of hormone crossing the placental barrier. Routine determinations of serum (T_4) and/or TSH is strongly advised in neonates in view of the deleterious effects of thyroid deficiency on growth and development.

Treatment should be initiated immediately upon diagnosis, and maintained for life, unless transient hypothyroidism is suspected; in which case, therapy may be interrupted for 2 to 8 weeks after the age of 3 years to reassess the condition. Cessation of therapy is justified in patients who have maintained a normal TSH during those 2 to 8 weeks.

ADVERSE REACTIONS:

Adverse reactions are due to overdosage and are those of induced hyperthyroidism.

OVERDOSAGE — Excessive dosage of thyroid medication may result in symptoms of hyperthyroidism. Since, however, the effects do not appear at once, the symptoms may not appear for one to three weeks after the dosage regimen is begun. The most common signs and symptoms of overdosage are weight loss, palpitation, nervousness, diarrhea or abdominal cramps, sweating, tachycardia, cardiac arrhythmias, angina pectoris, tremor, headache, insomnia, intolerance to heat and fever. If symptoms of overdosage appear, discontinue medication for several days and reinstitute treatment at a lower dosage level.

Laboratory tests such as serum T_4 , serum T_3 and the free thyroxine index will be elevated during the period of overdosage.

Complications as a result of the induced hypermetabolic state may include cardiac failure and death due to arrhythmia or failure.

TREATMENT OF OVERDOSAGE — Dosage should be reduced or therapy temporarily discontinued if signs and symptoms of overdosage appear. Treatment may be reinstituted at a lower dosage. In normal individuals, normal hypothalamic-pituitary-thyroid axis function is restored in 6 to 8 weeks after thyroid suppression.

Treatment of acute massive thyroid hormone overdosage is aimed at reducing gastrointestinal absorption of the drugs and counteracting central and peripheral effects, mainly those of increased sympathetic activity. Vomiting may be induced initially if further gastrointestinal absorption can reasonably be prevented and barring contraindications such as coma, convulsions, or loss of the gagging reflex. Treatment is symptomatic and supportive. Oxygen may be administered and ventilation maintained. Cardiac glycosides may be indicated if congestive heart failure develops. Measures to control fever, hypoglycemia, or fluid loss should be instituted if needed. Antiadrenergic agents, particularly propranolol, have been used advantageously in the treatment of increased sympathetic activity. Propranolol may be administered intravenously at a dosage of 1 to 3 mg over a 10 minute period orally, 80 to 160 mg/day, especially when no contraindications exist for its use.

DOSAGE AND ADMINISTRATION:

The goal of therapy should be the restoration of euthyroidism judged by clinical response and confirmed by appropriate laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels. The age and general condition of the patient and the severity and duration of hypothyroid symptoms determine the starting dosage and the rate of incremental dosage increase leading to a final maintenance dosage.

In otherwise healthy adults, the recommended initial dosage is 25 to 100 mcg (0.025 to 0.1 mg) daily, while the predicted maintenance dose of 100 to 200 mcg (0.1 to 0.2 mg) daily may be achieved in two to three weeks.

In the elderly patient with long standing disease, evidence of myxedema, or evidence of cardiovascular dysfunction, the initial dose may be as little as 12½ mcg (0.0125 mg) per day. Incremental increases of 25 mcg (0.025 mg) per day at 3 to 4 week intervals may be instituted depending on patient response. It is the physician's judgement of the severity of the disease and close observation of patient response which determine the rate and extent of dosage increase.

In infants and children there is a great urgency to achieve thyroid replacement because of the critical importance of thyroid hormone in sustaining growth and maturation. Despite the smaller body size, the dosage needed to sustain a full rate of growth, development and general thriving is higher in the child than in the adult. The recommended daily replacement dosage of L-thyroxine in childhood is: 0-1 years: 5-6 mcg; 1-5 years: 3-5 mcg/kg; 6-12 years: 4-5 mcg/kg of body weight daily.

DOSAGE FORMS AVAILABLE:

LEVOXINE (L-thyroxine) tablets are supplied as oval, coded, potency marked tablets in eleven strengths: 12½ mcg (0.0125 mg)—maroon, 25 mcg (0.025 mg)—orange, 50 mcg (0.05 mg)—white, 75 mcg (0.075 mg)—purple, 100 mcg (0.1 mg)—yellow, 112 mcg (0.112 mg)—rose, 125 mcg (0.125 mg)—brown, 150 mcg (0.15 mg)—blue, 175 mcg (0.175 mg)—turquoise, 200 mcg (0.2 mg)—pink and 300 mcg (0.3 mg)—green, in bottles of 100, 1000, unit dose cartons of 100 strips of 10 each, and 500 mcg injectable (See injectable package insert).

Levoxine[®]

(Levothyroxine Sodium Tablets, USP)

**Finally, a bioequivalent replacement
for Synthroid[®]
that's reasonably priced.**

Introducing Levoxine from Daniels Pharmaceuticals — a breakthrough in quality manufactured Levothyroxine Sodium Tablets, USP. Levoxine is now available in a 12½ mcg tablet for more precise dosing.

Randomized crossover studies comparing the bioequivalency of Levoxine tablets to Synthroid tablets showed no significant difference in thyroxine (T₄), triiodothyronine (T₃) or free thyroxine index (T₇).

Levoxine is available in eleven color-coded strengths to assure prescription compliance and patient acceptance. Each strength is put through extensive quality control measures to ensure the highest quality. Prescribe Levoxine, and give your patients exactly what they need at a price that's more affordable.

Environmental and Occupational Health

BERNARD D. GOLDSTEIN, MD

American society is characterized by a growing insistence on the citizen's right to understand and to participate in all areas of individual concern. As physicians, we have observed how this phenomenon has changed the practice of medicine. This insistence on being an informed decision maker has occurred at a time when improved overall health status, associated with advances in understanding the causes of illness, have led the public to expect the right to good health and an explanation for illness. Furthermore, public concern often is focused on an external factor causing a disease.

Among the external factors receiving particular attention in recent years has been the role of chemical and physical agents in the workplace and general environment. Injury and illness no longer are accepted as an inevitable consequence of occupations. Current public concern with chemical contamination of the general environment parallels the Sanitary Revolution of the mid-19th century. New laws, new regulatory agencies, and literally billions of dollars have been directed towards this problem. Of particular concern to the public has been the understanding that there not only is a potential threat of chemical and physical agents in the general environment or workplace, but that the effects of these agents can be insidious, developing after decades of exposure. The nature of such effects, particularly cancer and reproductive hazards, further has concerned the public.

In New Jersey, the public's discontent with chemical exposures has been particularly evident. In a poll taken before the last gubernatorial election, over 40 percent of the electorate listed the environment as the state's number one issue; the second choice, the economy, was chosen by only 12 percent of the voters.

Dr. Goldstein is the Director of the Environmental and Occupational Health Sciences Institute, and guest editor of this special issue.

The extent to which occupational and environmental factors impact on medical practice is difficult to determine. Whatever the actual impact, there is no question that diagnosis, treatment, and the prevention of the resultant diseases are to a greater or lesser degree part of the practice of every primary care practitioner and most specialists.

It is likely that occupational and environmental medicine problems more frequently will be brought to the attention of physicians. Community right-to-know provisions of the new Superfund Act and new worker right-to-know laws, guarantee that the public will be better informed about their exposure to chemicals at work and in their communities. This knowledge will lead to expressions of concern or questions to physicians. In addition, the controversial aspects of environmental problems increasingly are being dealt with locally. The public will be turning to their physicians for informed judgments.

It is impossible to cover every relevant topic in this issue of *NEW JERSEY MEDICINE*. The selection and depth of each presentation was based on patient experience at the UMDNJ-Robert Wood Johnson Medical School Environmental and Occupational Health Clinic, and communications with physicians.

The Environmental and Occupational Health Clinic (201/247-2511) is part of the Environmental and Occupational Health Sciences Institute (EOHSI), a joint program of Rutgers University and UMDNJ-Robert Wood Johnson Medical School. It is a unique, widely diversified academic program with a range of expertise that includes medicine, basic toxicology, and public education. The New Jersey State Departments of Health and of Environmental Protection have been very active in developing programs aimed at providing pertinent information to physicians and the public.

We hope this special issue will be of value to all readers; and we welcome the opportunity to provide support to physicians regarding environmental and occupational health problems. ■

PIC. It stands for Princeton Insurance Company.

And it stands for what Princeton Insurance Company is all about as well.

Protection, Innovation, and Commitment.

P

Protection

More than 5,500 of your colleagues have chosen Princeton Insurance Company for their practice-related insurance protection. Our Med-Pak Plus policy combines *Occurrence Plus* professional liability coverage with 20 other important coverages for your practice, all in one cost-effective package.

I

Innovation

Our *Occurrence Plus* policy responds to claims with your policy's limits in effect when the claim is reported, not your limits at the time the incident occurred. And *Occurrence Plus* includes an extended reporting endorsement ("tail" coverage). If you retire or relocate, you won't need to pay more for this essential protection.

C

Commitment

At Princeton, we believe we have an obligation to protect the professional reputations of our policyholders. That's the cornerstone of our defense philosophy and the reason we defend policyholders against claims which should be defended. It sounds simple, but the results are impressive — 89 percent of the cases we manage which go to court are resolved in favor of the insured.

Call your independent insurance agent to learn more about our coverages.

Environmental Health in New Jersey

BERNARD D. GOLDSTEIN, MD
AUDREY R. GOTSCH, DPH
PAUL J. LIOY, PhD

New Jersey is in the unenviable position of leading the nation in almost all measures of environmental risk. By a large margin, we have the most Superfund hazardous waste sites, close to one out of six sites in the entire country exist in our state. Our drinking water supplies are under siege due to a combination of multiple chemical sources on or under the ground, a relatively heavy reliance on well water and, for much of the state, an underlying soil structure that acts like blotting paper in spreading unwanted chemicals. Air pollution, while arguably worse in other states, still is a major concern, with summer ozone episodes, carbon monoxide, and volatile toxic organic chemicals as our biggest problems. The perceived health effect of pollution at the Jersey shore has had an impact on our way of life this summer. Dealing with hazardous waste from industry in New Jersey has been a topic of major attention for many years. Now, we are beginning to realize that our household garbage is a potential source of significant pollution, particularly as our landfills are at capacity, and we need to consider incineration or other means of dealing with trash. With all of our manmade problems, it seems unfair that we also have one of the highest cancer risks from natural radon in the nation.

There are two major causes for New Jersey's preeminence in environmental problems. The most apparent one is the historic and present size of our chemical, petrochemical, and pharmaceutical industries. We have the largest chemical industry in America. While the modern chemical industry runs under self-imposed or external restraints which are highly effective compared to past activities, risks still remain, particularly those associated with the

transport of chemicals and accidental occurrences. Use of chemicals by smaller industries not readily regulated by authorities remains problematic.

The second major cause for New Jersey's environmental health concerns is not directly due to industry, but reflects demographics. New Jersey, by far, is the most densely populated state in America. Our chemical industry and its detritus are thus cheek-by-jowl with all of us—not off in some distant and sparsely populated corner of the state. Many of our leading environmental problems reflect the actions of our dense population. Suburban sprawl increases reliance on cars and creates traffic problems and air pollution; gasoline stations with leaking underground storage tanks contribute to water pollution; and necessary waste disposal facilities are difficult to locate away from populated areas.

As described by Michael Greenberg in this issue, our high population density also has very important implications as we try to unravel the extent to which environmental pollutants are responsible for adverse health consequences in New Jersey. In particular, does the higher cancer rate in New Jersey reflect our exposure to environmental chemicals, or does it best correlate with factors associated with the suburban lifestyle?

ROLE OF THE PHYSICIAN

Realizing the public has an increased awareness and concern regarding environmental and occupational health issues, a statewide survey of New Jersey residents was conducted in 1985 by the Department of Environmental and Community Medicine, UMDNJ-Robert Wood Johnson Medical School. One of the purposes of the survey was to determine the public's use and perceived reliability of information sources. As noted in the Table, physicians were ranked lower than the media for use as an information source, but much higher for information

Requests for reprints may be addressed to Dr. Goldstein, Department of Environmental and Community Medicine, UMDNJ-Robert Wood Johnson Medical School, Piscataway, NJ 08854-5635.

reliability. Mass media sources, on the other hand, were ranked highest for use, though comparatively low for reliability.

As practitioners in New Jersey communities, physicians have assumed leadership roles in a variety of environmental health issues. For example, concern regarding the potential for increased risk of infectious diseases when swimming in ocean waters along the New Jersey shore led a number of New Jersey physicians to organize a group known as S.O.S. (Save Our Shores). Due in part to the efforts of this group, funds were secured to conduct an epidemiological study during summer 1988 to determine if there is an increased risk of contracting infectious diseases when swimming in New Jersey ocean waters.

This special issue of *NEW JERSEY MEDICINE* has been designed to provide the busy practitioner with highlights from a wide range of information about environmental and occupational pollutants that may be of concern to patients; the exposure to pollutants also may be the etiology for presenting symptoms. In order to function effectively as a physician dealing with potential environmental health problems, the basic concepts of exposure must be understood. In fact, it is this focus on exposure which distinguishes environmental medicine from other areas of medicine. Through understanding human exposure pathways, the physician not only will readily be able to diagnose chemically caused illness, but will be readily able to act preventively to protect family members, workers, and communities from potential illness.

POLLUTANTS

Pollutants that can cause human health effects are contained in a variety of media: air, water, soil, and food. Exposure results from contaminants in one of these media, such as asbestos in the air, or from multimedia pollution problems.

When analyzing a problem due to an environmental pollutant, the following factors have to be considered: identification of the source and the magnitude of the emission; the transport of the compound—how it moves from the source to the human body; transformation of the different pollutants when they react and form secondary products which can be less toxic or more hazardous than the initial compounds; and deposition within the human body—determined by the entering pathways into the body, as well as how the pollutant is metabolized and retained by specific organs.

Air Pollutants. Exposure to air pollutants by both direct or indirect exposure, can occur indoors as well as outdoors. Indoor air pollution has been recognized as a significant problem in the United States.

With the exception of ozone, outdoor air pollutants in the United States have decreased, particularly in New Jersey. However, ozone, which is formed through photochemical reactions with sunlight and other pollutants usually derived from automobile exhaust, remains a significant summertime dilemma. The importance of understanding the conjunction of human activities with air pollution peaks is exemplified by symptomatology and pulmonary function deficits observed in exercising children who

will be expected to be out-of-doors on those sunny days when the meteorology favors ozone formation. As ozone develops in the lower atmosphere only after a few hours of sunlight on smoggy days, exercising early in the morning is preferred to late afternoon or early evening.

Water Pollutants. The water pathway deals with sources that range from a major factory effluent to the local plating shop dumping waste into a creek. Although there are state and federal regulations to prevent this from occurring, on occasion, surface waters become contaminated and must be treated at sewage and water treatment plants before they can be used by humans.

Ground water sources for municipal water supplies or private wells also may become polluted. Private well contamination is a significant concern in New Jersey and must be evaluated on a case by case basis. A common source is leaking underground storage tanks, such as tanks used to store petroleum products at gasoline stations. Relatively cheap carbon filters can be easily installed on the faucet to remove organic compounds from tap water.

Food pollutants. Exposure from food is very difficult to assess. Except for homegrown fruits and vegetables, food quality usually is associated with a region of the country. Contamination most frequently is due to specific types of pesticides or is due to polluted soil. Other pollutants may increase in concentration during improper food preparation or storage, such as lead from glazed ceramic vessels.

Contaminated Soil. Soil can be contaminated by waste tailings, illegal dumping, or factory wastes that have been deposited in piles and allowed to percolate into the soil. In some cases, contaminants are distributed within abandoned landfills, resulting in pockets of high waste contamination throughout the site. Soil contaminant uptake into the body can be through the skin or, particularly in children, by ingestion. Indirect modes, through uptake into garden vegetables or dust inhalation, are possible.

ASSESSING EXPOSURES

The process of assessing exposures involves the ability to prioritize the level of effort or concern that is attached to the particular pathway. For example, the most important pathway to man for ozone exposure would be outdoor air. Another pollutant, such as trichloroethane, may be emitted through indoor air as a result of outgassing vapors from dry cleaned clothes. Several pathways may be involved in a multimedia problem, such as lead, since it can be emitted into a variety of media along with other toxic elements. The difficulty in dealing with multimedia problems is determining the level of effort necessary to define the concentrations of compounds present and the form presented to the individual

from each pathway. Multimedia analyses have to be directed toward very specific problems; some may be pertinent for individuals while others may deal with problems associated with a much larger population.

In the future, the concentration of compounds, especially in air and water, may well continue to be reduced because of control efforts. However, advances in analytical chemistry inevitably will lead to detection of additional pollutants at levels now below analytical sensitivity. Thus, "vanishing zero" likely will fuel further possible concern. A critical problem will be the small pollutant sources that are not regulated but produce locally high exposure levels that may impact significantly on individuals in specific environments. The symptoms exhibited by patients exposed to these pollutants during a physical examination may be difficult to diagnose because information on the time and duration of exposure frequently is difficult to obtain.

The future also will bring improved techniques to measure exposure. Of particular interest is the potential that the exciting new advances in molecular biology will lead to the ability to detect small amounts of chemicals, or metabolites, attached to DNA or other macromolecules. Such biological markers may provide both an indicator of exposure and a predictor of effect, much like now provided for carbon monoxide exposure and toxicity by measurement of carboxyhemoglobin.

CONCLUSIONS

While it is true that New Jersey residents have had cause to be concerned, findings of a recent study indicate that New Jersey is taking an active role to guide future events. For example, the Conservation Foundation reports that New Jersey ranks third among the 50 states in strength of its environmental programs. The New Jersey Department of Environmental Protection has established the nation's largest state program devoted to hazardous waste management and cleanup. In addition, The Fund for Renewable Energy and the Environment recently chose New Jersey's hazardous waste management program as the best state program in the nation.

With the establishment of an Environmental and Occupational Health Sciences Institute by UMDNJ-Robert Wood Johnson Medical School and Rutgers, The State University of New Jersey, it now will be possible to conduct research in areas that are specific to the needs of our state.

The articles in this issue include examples of current investigations that are taking place in New Jersey regarding reproductive hazards, asbestos, pesticides, risk assessment and communication, indoor air pollution, and dioxin. ■

**“A fee-for-service insurance program
with complete office coverage?”**

**I don't
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

When you asked for a fee-for-service insurance program with comprehensive medical coverage, we listened. Because we all share a common concern, the welfare of your patient.

And when you told us fee-for-service had to cover all your in-office claims, we heard you.

Together we've developed Medallion, the best insurance for a healthy practice—and your patients.

Comprehensive fee-for-service.

The insurance program you want with the comprehensive medical coverage your patients need, including office visits, well child care and unlimited laboratory and X-ray services. Just bill your usual charges for each and every service you perform.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

A Little Behind In Managing Your Finances?

AMA Advisers MONEY MASTER Account...

Even if you're pretty much on top of your personal or business money management duties, there's an easier way to handle it all that can save hours of your precious free time. It's the **AMA Advisers Money Master Account**, a state-of-the-art financial management system for managing your assets, investments, savings, expenses — even your insurance! With **Money Master**, you'll discover how easy personal finance can be.

AMA Advisers Money Master Account simplifies financial management with:

- **Your Own Budget Analysis...** through the use of coded checks you'll see your monthly expenses sorted and totaled into one of 37 pre-set categories such as insurance premiums, charitable contributions, education, utilities, vacation and many more. Great for personal or professional budgeting!
- **Discount Brokerage Services...** that enable you to trade stocks, bonds, government securities, options and of course, mutual funds.
- **One Monthly Statement for ALL Your Investments.** In addition to investments made through your **AMA Advisers Money Master Account**, simply supply us with the appropriate information and for your convenience, we'll track your investments, even those made through other brokers or mutual fund organizations. All that you tell us about will be shown on your **Money Master Account** statement.

Building Mutual Trust

AMA ADVISERS, INC.

AMA Advisers, Inc. is a subsidiary of the American Medical Association and manages the mutual funds in The AMA Group.

Services and products as described herein are not offered for sale in any state where they are not lawfully registered.

- **Special Year-End Statement Practically Completes Your Tax Return For You!** At year end, you'll receive a statement so complete that it even shows the proper tax schedule to use for filing your return! All you do is transfer the information to the form.
- **High Money Market Returns On Your Checking Account!** You earn money market rates on all the money in your account until the day your check clears, since an AMA Money Fund Account is opened through the **Money Master Account**.

If you would like convenience of a **Money Master Account**,

Radon in New Jersey

JUDITH B. KLOTZ, DPH
IRIS G. UDASIN, MD

High levels of radon in homes are major public health problems, and represent avoidable causes of lung cancer. The widespread radon problem became known when it was discovered that houses located on specific geological formations had surprisingly high concentrations of this radioactive gas and its decay products. Radon is a radioactive gas in the decay chain of the ubiquitous isotope, uranium-238 (Figure 1). When radon decays, its radioactive decay products, radon progeny or radon daughters, can be inhaled and deposited on the respiratory passage linings.

HEALTH RISKS

Alpha radiation is emitted by short-lived radon decay products. Of all types of radiation, alpha particles are the most damaging to cells. They are highly charged, but are relatively bulky (two protons and two neutrons) and have such a short penetration distance that only a few layers of cells are impacted. They do not pass through skin, nor beyond the respiratory mucosa when in the airway. Physiological and morphometric studies predict a very high radiation dose to the respiratory system from inhalation of radon decay products; both animal studies and epidemiologic investigations corroborate these predictions and show a dose-response relationship of lung cancer with cumulative radon progeny exposure. In fact, there is a remarkable degree of agreement in the carcinogenic dose-response observed in

several species of animals and in the numerous occupational studies of underground miners. As a result, we are quite confident about the type and the approximate degree of cancer induction which result from radon exposure of humans.

Epidemiological correlation studies of lung cancer mortality and typical indoor radon concentrations of geographic areas are not able to discern a correspondence because of population mobility whereby exposures may be accrued in one location and mortality occurs later in another. Further, slight fluctuations of cigarette use have much greater effects on lung cancer rates and statistically obscure any radon effects. However, large individual-based epidemiologic studies may be capable of detecting associations and, for this reason, such investigations are underway in New Jersey and elsewhere.

Occupational evidence consistently suggests that lung cancer risks due to radon are alarmingly high. Perhaps as much as 10 percent of lung cancer in the United States may be related to indoor radon exposure. If extrapolations from the data based on underground miners are correct, the number of lung cancer deaths related to radon might exceed the number of deaths from kidney cancer, and might approximate the mortality from leukemia. It has been estimated that the lung cancer risk resulting from average exposure to 20 pCi/l (or 0.1 WL) is about equivalent to the risk associated with smoking one pack of cigarettes per day. For smokers, the excess risk from radon exposure probably is more than for nonsmokers.

Clinically, the sites of lung cancer induced by radon decay products tend to be tracheal and upper

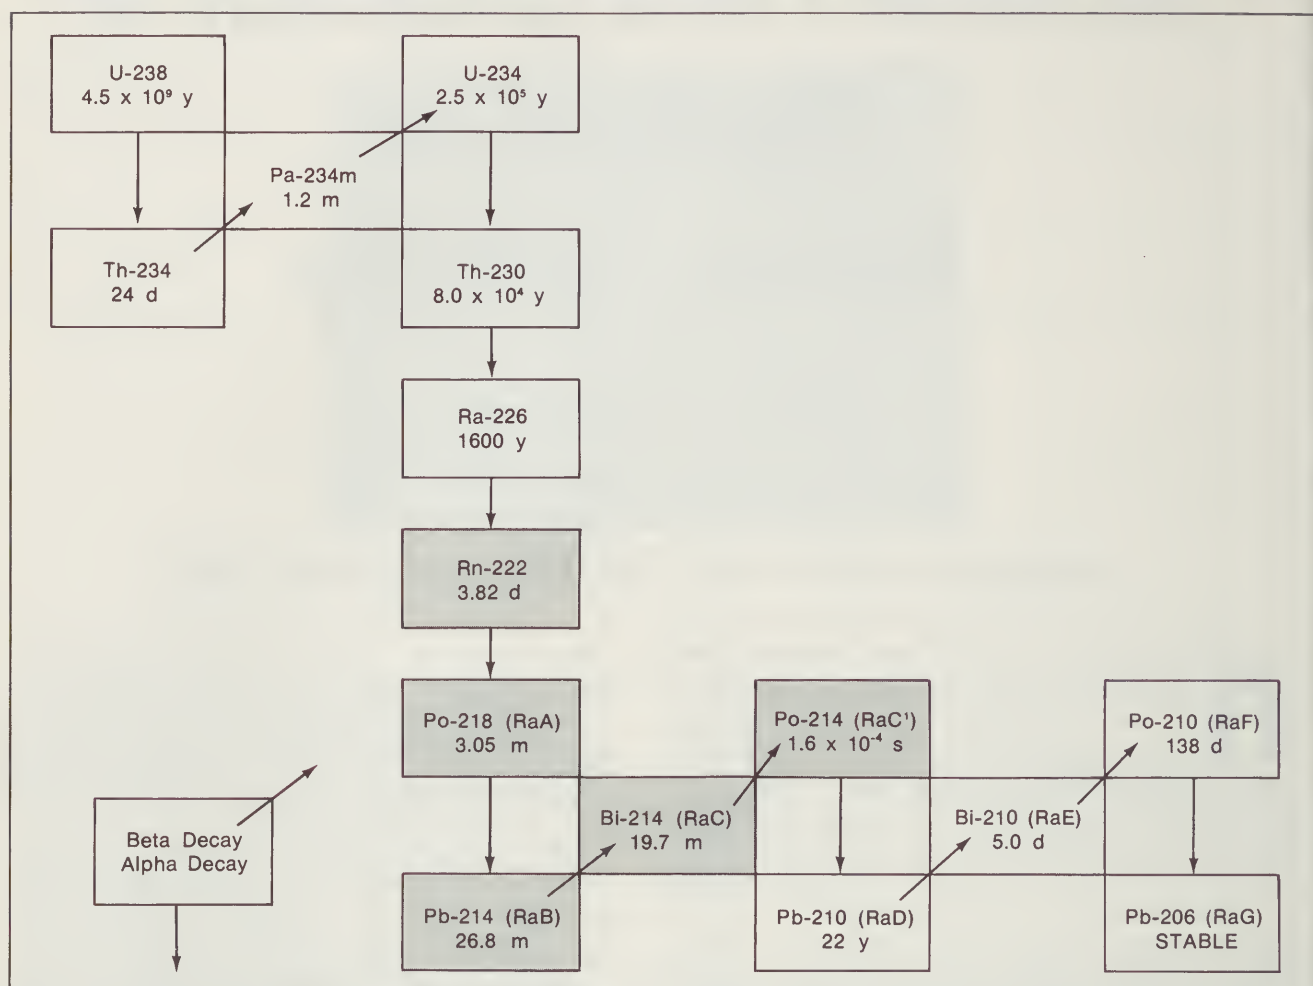

Figure 1. Principal decay scheme of the uranium series, showing radioactive half-lives in years, days, minutes, or seconds (NCRP 1984, Report No. 77). Screened areas show radon and short-lived progeny.

Table. Estimated additional cases of lung cancer in a lifetime if 75 percent of the time is spent at home, for each 1,000 people.

Average Concentration in the Home		Length of Residence		
Radon Gas picocuries per liter (pCi/l)	Radon Progeny working levels (WL)	1 Year	5 Years	20 Years
1 (typical U.S. home)	0.005	less than 1	less than 1	1
4 (guidelines for remediation)	0.02	less than 1	1	6
20	0.1	1	7	28
100	0.5	6	35	140
200	1.0	14	70	less than 250

bronchial, and usually are of squamous or small cell histology.

While radon exposure clearly is less important than smoking as a cause for lung cancer, epidemiologic evidence indicates that the interaction between smoking and radon in lung cancer induction is more than additive, and may even be multiplicative. Recent analyses by the National Research Council also suggest that greater numbers of radon-induced lung cancer occur in men than in women, since excess risk is expressed as a proportion of the underlying risk. They also conclude that the excess exposure causes the greatest increased percentage in risk between 5 and 15 years after the exposure occurs.

Mining studies do not indicate that excesses of other types of cancer or other diseases are caused by radon exposure.

EXPOSURE UNITS

Radon gas is measured in terms of radiation activity; the unit is curies (Ci). Radon progeny, however, traditionally are measured in working levels (WL) referring to former underground mine standards. A typical American house might have 1 picocurie per liter (pCi/l, or 10^{-12} Ci/l) of radon gas. Associated with that radon concentration one would predict about 0.005 WL radon progeny in such a residence. The unit for describing cumulative human exposure is working level month (WLM). People who spend 75 percent of their time in a house with 0.005 WL would accumulate 0.2 WLM in one year or 10 WLM over 50 years. (The traditional WLM is based on only 35 hours per week spent in mines by workers, therefore, in residences about 40 rather than 12 WLM are accrued per year per WL). It has been estimated that about 0.5 rad (500 mrad), or 10 rem (10,000 mrem) of alpha radiation are imparted to the respiratory system for each WLM.

The United States Environmental Protection Agency (EPA) and the Centers for Disease Control recommend remediation of buildings where average radon concentrations are over 4 pCi/l; this level corresponds to 0.8 WLM per year or 40 WLM over 50 years.

There is a significant number of homes in New Jersey which exceed these guidelines, but the guidelines are set as low as currently is practical, and are only about four times the typical levels for the nation.

DISTRIBUTION

Uranium-238 and its products are naturally occurring in soil. Because radon is an inert gas, it may travel easily into the basements of homes as part of soil gas. Construction, heating, and ventilation fac-

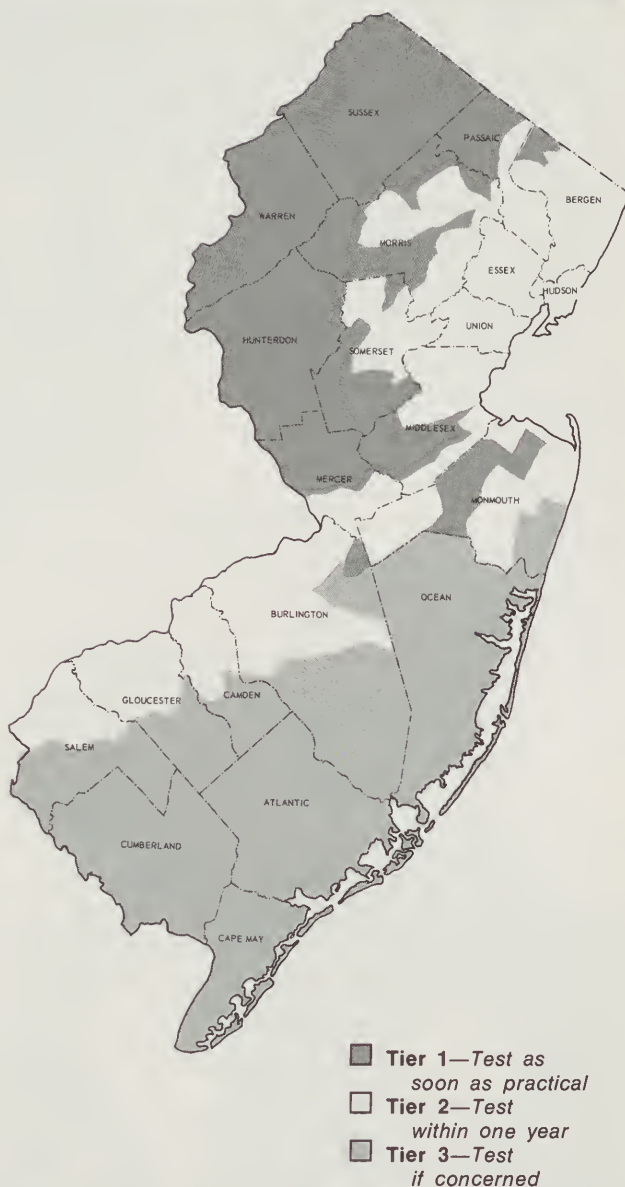

Figure 2. DEP preliminary recommendations for radon testing.

tors greatly influence the degree of accumulation of radon gas inside a house after its entrance from the soil. These factors also influence the relative concentration of radon and its progeny among different floors of the house.

Detectable concentrations of radon and its progeny exist in both outdoor and indoor air. Higher than average concentrations from natural sources have been found throughout the United States. New Jersey has extensive geologic uranium deposits, and consequently there is a widespread potential for high radon levels in indoor air, especially in the northwest section of New Jersey (Figure 2).

In rare instances, many houses with very high radon concentrations from geologic sources are clustered within a small area. Generally, there is

great variation of concentration among neighboring houses. Excess radon derived from industrial radium waste also has affected a few neighborhoods in New Jersey. Although these instances are very troubling, the radon concentrations derived from industrial sources have been lower than those found in some of the clusters due to natural sources.

Radon concentrations also fluctuate greatly over different times of the day and different seasons. As a result, long periods of testing, e.g. three months or one year, are advisable for determining typical radon concentrations of a building, particularly if the concentrations are relatively low. Under those circumstances, long testing periods are required to verify whether further remediation is effective.

In large nonresidential buildings such as schools and offices, radon concentrations tend to be lower than in smaller structures. Furthermore, people tend to spend fewer hours in buildings other than their homes, and thus accumulate less exposure from nonresidential sources. Although nonresidential exposure settings often are important sources of exposures, they generally present a far less serious radon hazard to the public than residences.

PREVENTION

The physician has an important role to play in the prevention of lung cancer due to radon. In areas of New Jersey with high exposure potential, families should be encouraged to obtain the available literature and have their homes tested. State and federal pamphlets may be distributed in the waiting rooms of physicians' offices and distributed to community groups through the auspices of individual physicians and local medical societies. Most importantly, physicians should test their own homes and offices and be sufficiently knowledgeable to discuss radon testing within their own communities.

Prevention of a portion of radon-induced lung cancer can be accomplished through screening of homes in areas with a high potential for exposure, by further testing where screening results are above guidelines, and by remediation of homes which are confirmed to have higher than recommended con-

centrations. The existing body of information on radiation carcinogenesis indicates that there is no threshold dose below which there is no risk. Consequently, since it is impossible to avoid some radon exposure, the emphasis for prevention is on avoidance of unnecessarily high concentrations. It is inappropriate to consider any concentration as safe. State and federal recommendations are based not on acceptability of risk but on feasibility of remediation. Suggested procedures for both testing and mitigation are issued and distributed from governmental agencies.

Federal and state guidance recommend that the urgency for remediation is dependent on radon progeny concentration. For homes with very high levels, temporary short-term exposure reduction can be accomplished while permanent solutions are being considered and implemented. Simple ventilation, e.g. keeping windows open, and adjusting the use of different areas of the home, e.g. limiting time spent in the basement, can reduce immediately the exposure of occupants.

Current research on new building construction is expected to yield methods for constructing radon-resistant houses in the future. Hopefully, building construction code modifications eventually will provide a means for ensuring that new housing stock does not present unnecessary radon exposure.

FURTHER INFORMATION

Additional information on radon is available from the Public Education and Risk Communication Division of the Environmental and Occupational Health Sciences Institute. The New Jersey State Department of Environmental Protection (DEP) offers: "Citizen's Guide to Radon"; "Radon Reduction Methods, A Homeowners' Guide"; and a list of testing and mitigation firms complying with DEP guidelines. The New Jersey State Department of Health publishes: "Facts and Recommendations on Indoor Radon"; "Nonresidential Exposure to Radon: Facts and Recommendations"; and forms for voluntary registration of persons with high accumulations of radon exposure. ■

Dioxin Exposure and Health

MICHAEL GOCHFELD, MD, PhD

MICHAEL GALLO, PhD

PETER KAHN, PhD

In terms of the extent of media coverage, dioxin can be viewed as the toxic chemical of the decade. The polarity of views on its toxicity include those who believe it is a clearly identified scourge,¹ and those who believe that no significant human health problems are attributable to it.^{2,3} Federal agencies are in the throes of abandoning research projects on dioxin or reevaluating their risk assessments. Although the potential exposure of humans to dioxins was highlighted and focused by the widespread use of herbicides in Vietnam, the problem of dioxin exposure is by no means unique to veterans of the Vietnam war.

The controversy over dioxin is heightened by the confusion in nomenclature. To a chemist, a dioxin compound is one in which two moieties are linked by two oxygen bridges (Figure 1a). Among the dioxins are those in which the moieties are two benzene rings, hence the term dibenzodioxins (Figure 1b). Almost all attention focuses on polychlorinated dibenzodioxins, particularly those with four or more chlorine atoms (Figure 1c). To the vast majority of people, however, the term dioxin is synonymous with the compound shown in Figure 1d, 2,3,7,8 tetrachloro-para-dibenzodioxin. This compound also is abbreviated as TCDD (although there are two other tetrachloro isomers) or, more correctly, as 2,3,7,8-TCDD. We will use the term 2,3,7,8-TCDD and dioxin synonymously, while "dioxin" will refer to polychlorinated dibenzodioxins. A closely related class of compounds are the polychlorinated dibenzofurans, distinguished from dioxins by the single ox-

ygen bridge (Figure 1e).

In considering the toxicity of dioxin, it is possible to distinguish industrial versus environmental exposure, and acute versus chronic exposure. Acute industrial exposures occurred with accidents in Newark; Nitro, West Virginia; and Seveso, Italy, the latter also caused extensive environmental contamination.⁴ Acute environmental exposures occurred during spraying of 2,3,7,8-TCDD-contaminated defoliants.

Although such exposures are dramatic, the public has been more concerned with long-term low level exposure in the community and in Vietnam.⁵ Although the saga of the Vietnam veteran has been a long time unfolding, community exposure has been emphasized by such well-publicized events as Times Beach, Missouri⁶ and the Iron Bound section of Newark. The most familiar of the dioxin incidents was the contamination of Times Beach, by 2,3,7,8-TCDD which resulted in a federal government decision to buy out all the residents of that town.⁶ The occupational and community contamination of the Iron Bound section of Newark has been extensively studied. A major difference between Times Beach and Newark 2,3,7,8-TCDD episodes is that in the sandy soil of the former, the 2,3,7,8-TCDD was readily bioavailable, while the more complex "organic" soil of Newark held the substance more tenaciously, rendering it mostly biologically unavailable, and therefore reducing its risk.^{7,8}

SOURCES OF DIOXIN EXPOSURE

Chlorinated dibenzodioxins arise in a variety of settings, particularly as a result of combustion under natural as well as artificial conditions⁹ or through

Requests for reprints may be addressed to Dr. Gallo, UMDNJ-Robert Wood Johnson Medical School, Piscataway, NJ 08854.

reactions of chlorinated aromatic compounds. Public attention has focused on garbage incineration as a source of dioxin fallout. More dramatic has been the issue of dioxin exposure of veterans exposed to herbicides. Whereas there are many "dioxins" formed during incineration, the dioxin contaminant of herbicides is almost exclusively 2,3,7,8-TCDD.

Agent Orange was a mixture of two common garden herbicides, 2,4-D and 2,4,5-T (trichlorophenoxyacetic acid). During synthesis of the latter (Figure 2b) from 2,4,5-trichlorophenol (Figure 2a), a certain amount of 2,3,7,8-TCDD was produced (Figure 2c). The configuration of the chlorines on the trichlorophenol assured that it is only the 2,3,7,8 isomer that was accidentally produced. The same dioxin has been found as a contaminant of hexachlorophene, which previously was a commonly used medical antiseptic agent. During the production of pentachlorophenol, the octachloro dibenzodioxin was produced as a byproduct.

HEALTH EFFECTS

The controversy over the magnitude of the 2,3,7,8-TCDD impact on human health focuses on whether human susceptibility is more similar to the guinea pig or to the mouse. The spectrum of health effects attributed to 2,3,7,8-TCDD includes: death, chloracne, cancer, hepatotoxicity, immunosuppression, porphyria, and neurobehavioral and psychological changes.

Chloracne, a potentially severe skin disease is the most characteristic human disorder caused by dioxins. The basic biology of the skin is altered, and the disease may last for decades, even after the cause is removed. Clinically, chloracne is difficult to distinguish from other acneiform lesions; diagnosis is based partly on its distribution, (periorbital, earlobes, neck, abdomen, legs), duration, and history of exposure. It most often results from acute exposures to chlorinated aromatic compounds.¹⁰ Some authorities argue that if chloracne does not occur, one need not worry about dioxin exposure. This view is not widely accepted, for other conditions may rise in animals from chronic low level exposure, even though chloracne does not develop.

2,3,7,8-TCDD is an animal carcinogen.¹¹⁻¹² Several kinds of cancer have been produced, and it appears to have both initiation and promotion effects, i.e. it can itself initiate the development of a new tumor in the absence of any other chemical, and it also can facilitate the development of a tumor initiated by another chemical carcinogen. In humans, however, the evidence for cancer causation is controversial. Cancers of the connective and related tissues, called soft-tissue sarcomas, have been attributed to dioxins,¹³⁻¹⁴ but some studies have questioned this rela-

tionship.¹⁵ More recently, Hodgkin's disease and non-Hodgkin's lymphomas have been attributed to chlorinated phenoxyacetic acids, with the suspicion that dioxins may contribute. An unpublished Veteran's Administration study has shown that marines who served in Vietnam have experienced an excess mortality due to lung cancer and non-Hodgkin's lymphomas.¹⁶ Thus, although the carcinogenic potential of 2,3,7,8-TCDD is recognized, its relation to human cancers is unclear.

There is evidence that dioxin exposure interferes with the body's normal cell-mediated immune mechanisms, and could render it more susceptible to disease. Moreover, the metabolism of porphyrins, chemicals derived from the normal breakdown of heme, is altered, and certain people with dioxin exposure may suffer from the porphyria.¹⁷ In experimental animals, liver disease can be produced by dioxin treatment, and cases of liver damage have been reported in exposed humans as well. 2,3,7,8-TCDD is among the most potent inducers of microsomal enzymes yet identified, and is capable of altering the metabolism of endogenous agents such as hormones and exogenous agents, e.g. foods and environmental chemicals.

Another significant effect in animal experiments is the teratogenic effect, for dioxins can interfere with gestation resulting in miscarriages, stillbirths, or abnormal offspring.¹⁹⁻²⁰ Animal experiments show abnormalities occurring at very low exposure levels. The interpretation of epidemiologic studies of birth defects and adverse reproductive outcomes among Vietnam veterans is controversial,²¹⁻²² and exposure data in such studies were inadequate. Both negative and positive studies are being subjected to very careful epidemiological scrutiny.

The main studies now being conducted on human populations include a National Institute of Occupational Safety and Health study of herbicide manufacturing workers, and studies of Vietnam veterans who are believed to have seen significant exposure to Agent Orange. Studies of the latter are being conducted by the United States Air Force, by the Veterans Administration, and by various states, including the New Jersey Agent Orange Commission.²³ These studies will focus on biochemical, physical, and psychological health effects.

THE POINTMAN PROJECTS

The New Jersey Pointman I study has demonstrated that even 15 to 20 years after presumed exposure, veterans who handled herbicides in Vietnam had significantly higher levels of 2,3,7,8-TCDD in their adipose tissue and blood (averaging greater than 40 parts per trillion and in some cases above 150 parts per trillion), compared with nonexposed

veterans and the general population whose levels average about 5 parts per trillion.³¹ Most importantly, there were no significant differences for other "dioxin" and dibenzofuran compounds,²⁴ supporting the supposition that the source of the elevated TCDD was Agent Orange exposure.

The first Pointman study was predicated on the fact that the gold standard for body burden of 2,3,7,8-TCDD is its concentration in adipose tissue. Lipophilic or hydrophobic compounds naturally concentrate in fatty tissues or cells. The research showed clearly, however, that the concentrations of TCDD in the blood lipids are not appreciably different from the concentration in fat, and the correlation between the two is very high, greater than 0.8 in the Pointman study, and greater than 0.9 in a comparable Centers for Disease Control (CDC) study.²⁵ The Pointman study used a 24-hour fast prior to drawing the blood, but a second study of the same group of men showed no difference in blood levels with and without fasting.²⁶ Accordingly, future studies of dioxin in humans can be based on spot blood samples. However, in order to have adequate sensitivity in the parts per trillion range, the analysis requires over 300 ml of blood.

An important factor in understanding the dynamics and health effects of dioxins is their half-life in the human body. Assuming that an individual had a single exposure, what is the decay curve that characterizes the substance? Recent evidence obtained by the CDC suggests that the half-life may be seven years.²⁵ There are good metabolic reasons for believing that a first order decay curve is not appropriate for the elimination of these compounds from the body, in which case the true half-life may be much longer. Given a seven-year half-life, the observation of a level in excess of 150 parts per trillion in a Vietnam veteran in 1985 can be extrapolated back to a level of 600 parts per trillion in 1971.

Occupationally exposed groups also are being investigated by the National Institute for Occupational Safety and Health. This study is focusing on about 500 workers in the herbicide-manufacturing industry in New Jersey and Missouri.

INCINERATION

About 15 years ago, researchers at Dow Chemical Corporation showed various dioxins are produced by the incineration of natural and synthetic products.⁹ A variety of incinerators has been studied with respect to chemical contaminants in the ash and airborne emissions, and dioxins are among the pollutants found.²⁷ Although present, 2,3,7,8-TCDD is not the major "dioxin" constituent. Risk assessments have been developed for dioxin contamination

from incineration, but the exposure data still are very sparse. Some of the other types of isomers are nearly as toxic and occur in greater quantities. Thus far, in most cases, the amount of total dioxins has been below the parts per billion range.²⁸ Technological developments could be used to reduce the dioxin contamination.

The medical community has not yet been provided with sufficient scientific data to evaluate the safety of garbage incinerators with respect to dioxins

Figure 1. (a) General chemical structure of a dioxin compounds, with two organic moieties bridged by two oxygen atoms; (b) generalized dibenzodioxin with the standardized numbering of the carbon positions; (c) compound 1,2,3,7,8-pentachloro dibenzodioxin; (d) 2,3,7,8-tetrachloro-para-dibenzodioxin, the compound commonly referred to as TCDD or dioxin; (e) 2,3,7,8-tetrachlorodibenzo furan, revealing the single oxygen bridge of the furan compounds.

or other substances. The requisite include extensive environmental monitoring of the air emissions from a variety of facilities over a long period of time. For example, if a measurement is only made once or twice, just after the facility has started up (when it may be at peak efficiency), there is no way to predict what kind of emissions to expect in the weeks just prior to its annual maintenance. Nor is there any indication of the importance of human factors, always a fragile link in a technological system, in maintaining operating conditions at specifications.

It should be possible to construct safe incineration systems, but there is a void between the theory and the realization. A variety of assurances are required before the medical community can rest in comfort that a particular incineration facility poses no health hazard to the surrounding community. New Jersey's Hazardous Substance Management Research Center based at the New Jersey Institute of Technology is in the forefront of research on technology for safely destroying such hazardous chemicals and for assuring that environmental contamination problems do not occur. Moreover, recent research suggests that the concern with dioxin may cause people to overlook other hazards related to incineration emissions such as heavy metals, particularly chromium, which are not destroyed by incineration.³⁸

DIOXIN IN NEWARK

In 1982, studies of TCDD levels in fish and crabs from the Passaic River and Newark Bay led the New

Jersey State Department of Environmental Protection to an unsuspected dioxin-contaminated site.²⁹ The former Diamond Shamrock facility on Lister Avenue in the Ironbound Section of Newark had been a manufacturing site for phenoxyherbicides, and in the wake of industrial accidents and onsite disposal, much of the ground on the property and along access roads was contaminated with 2,3,7,8-TCDD. More than one million dollars was spent on soil analyses and site "mitigation" procedures, and state and academic experts spent much time evaluating the potential for human exposure in terms of available data and risk assessments.

The dioxin in Newark was present in the soil, and human exposure would require either that dioxin-bearing dust became airborne and was inhaled, or that people ingested the soil or were exposed through the skin. Since dioxin is not readily absorbed through intact skin, attention has focused on inhalation and ingestion. Accordingly, a study of the bioavailability of the dioxin in the Newark soil found that the toxicity of the contaminated soil fed to guinea pigs was 50 times lower than would have been expected from the dioxin concentration.⁷ Results showed that the dioxin in this soil had low bioavailability due to its binding to oily material also present in this soil, and then demonstrated that dioxin in soil from Times Beach, Missouri (another dioxin-contamination site), was much more bioavailable.⁸

In view of the uncertainty that human exposure

Figure 2. Pathway for the synthesis of the herbicide, 2,4,5-trichlorophenoxyacetic acid (b) from two molecules of the raw material 2,4,5-trichlorophenol [a], resulting also in the formation of the unwanted byproduct, 2,3,7,8-tetrachlorodibenzo dioxin (c).

actually had occurred, a health study of this community has been deferred, and attention has focused instead on the former employees of the company who almost certainly would have had a high level of exposure.

THE PROBLEM: EVALUATING CAUSATION

We identify four problems that have impeded development of a clear statement of human health risks associated with 2,3,7,8-TCDD:

1. The first problem concerns the extreme difficulties involved in adequate laboratory assay of dioxins.³⁰ Few laboratories are equipped to handle the standards necessary. Moreover, the dioxins are present at the parts per trillion level, which would tax the sensitivity and precision of any laboratory, as well as its cost-effectiveness. New Jersey now is making strides to improve the availability of highly sensitive analytical capabilities at reasonable cost.

2. We are confronted by a health effects literature with widely divergent reports. In part, such divergent opinions reflect the fact the authors did not know true exposures, hence in negative studies some of the people with no symptoms or signs may not have been truly exposed, while the same could be said for positive studies.

3. The long latency of some problems attributed to dioxins, particularly cancers, means that adequate time has not yet elapsed to allow a true measure of the ill effect. Hence, scientific reports of certain cancers produced by dioxins in animals and perhaps in Vietnamese people are disquieting.³¹

4. We still do not have a clear picture of how to extrapolate the effects of dioxin on laboratory animals to predict the effects in humans. The EPA recently has revised its estimate of the human risk from dioxin exposure, concluding the TCDD is only about 1/16th as dangerous as previously estimated.

DIOXIN EXPOSURE

There is increasing clamor among veterans and community residents to determine whether they have had significant exposure or adverse health effects due to a host of environmental pollutants, including 2,3,7,8-TCDD.³² Diagnosis of chloracne certainly suggests exposure to chlorinated aromatic compounds, but 2,3,7,8-TCDD is only one of several compounds that could be implicated, and seldom is present in sufficient concentration or quantity to induce chloracne. No other "sentinel" or diagnostic criteria have been established.

One approach would be to focus on evaluating those systems on which chlorinated aromatic compounds have a known impact, namely liver function, uroporphyrin excretion patterns, and cell-mediated immunity. In our experience, however, the main con-

cerns of individuals who have had or suspect chemical exposure of any kind, including TCDD, are cancer and birth defects.

The ability of the clinician to assess such risks and, if appropriate, to reassure an anxious individual, is limited. Introduction of test systems such as DNA-adducts which determine whether an individual's DNA has covalently bound dioxin might reveal individuals with an enhanced risk. Such techniques are on the horizon, but probably will not be practical on a large scale within the next decade.

More realistically, the clinician must make sufficient inquiries to determine the dose or exposure which a patient has encountered. Thus, even being in the presence of a highly toxic material such as 2,3,7,8-TCDD will have little impact if there has been no actual exposure. The recent studies showing low bioavailability of 2,3,7,8-TCDD in certain soils is an important indication that dioxins may be present without posing a significant health hazard.⁵⁸

In the absence of a definitive evidence of exposure, a clinician must explain to a patient the uncertainty regarding risk. One may feel comfortable in reassuring rather than alarming a patient, but ultimately the fact remains that we neither have clear evidence of health effect nor grounds for complacency. Detailed health and exposure studies must be carried out to provide answers. Such studies also may identify for the patient the sources of exposure that are to be avoided, particularly the consumption of contaminated foods or direct contact with contaminated soil.

CONCLUSION

The dioxin issue remains a significant public health problem. While epidemiologists continue to explore the impact of dioxin exposure on human populations, health educators need to be at work putting dioxin contamination into perspective. It appears safe to say that despite its intrinsic toxicity, a major human health impact of dioxin has not yet been demonstrated.

Whether or not a causal link to human disease is shown, dioxin clearly has served to raise the environmental consciousness of a generation, but it should not detract critical attention from other environmental contaminants which pose more significant health hazards.

Whatever the final verdict regarding human disease attributable to 2,3,7,8-TCDD, the situation offers important lessons for environmental and occupational medicine and toxicology. Probably no other single substance, not even lead, asbestos, or benzene, all of which more clearly cause significant disease, has attracted more scientific and nonscientific attention in such a short period of time. ■

☐ SUBSTITUTION PERMISSIBLE

☒ DO NOT SUBSTITUTE
JK

THEO-DUR[®]
(theophylline anhydrous) Sustained
Action
Tablets

**There's no substitute
for success.**

See following page for brief summary of prescribing information.

THEO-DUR®

THEOPHYLLINE (Anhydrous) Sustained Action Tablets

INDICATIONS: THEO-DUR is indicated for relief and/or prevention of symptoms of asthma and for reversible bronchospasm associated with chronic bronchitis and emphysema.

CONTRAINDICATIONS: THEO-DUR is contraindicated in individuals who have shown hypersensitivity to theophylline or any of the tablet components.

WARNINGS: Status asthmaticus should be considered a medical emergency and is defined as that degree of bronchospasm which is not rapidly responsive to usual doses of conventional bronchodilators. Optimal therapy for such patients frequently requires both *additional medication*, parenterally administered, and *close monitoring*, preferably in an intensive care setting.

Although increasing the dose of theophylline may bring about relief, such treatment may be associated with toxicity. The likelihood of such toxicity developing increases significantly when the serum theophylline concentration exceeds 20 mcg/ml. Therefore, determination of serum theophylline levels is recommended to assure maximal benefit without excessive risk.

Serum levels above 20 mcg/ml are rarely found after appropriate administration of recommended doses. However, in individuals in whom theophylline plasma clearance is reduced for *any reason*, even conventional doses may result in increased serum levels and potential toxicity. Reduced theophylline clearance has been documented in the following readily identifiable groups: 1) patients with impaired renal or liver function; 2) patients over 55 years of age, particularly males and those with chronic lung disease; 3) those with cardiac failure from any cause; 4) neonates; and 5) those patients taking certain drugs (macrolide antibiotics and cimetidine). Decreased clearance of theophylline may be associated with either influenza immunization or active infection with influenza.

Reduction of dosage and laboratory monitoring is especially appropriate in the above individuals. Less serious signs of theophylline toxicity (i.e. nausea and restlessness) may occur frequently when initiating therapy, but are usually transient; when such signs are persistent during maintenance therapy, they are often associated with serum concentrations above 20 mcg/ml. Unfortunately, however, serious side effects such as ventricular arrhythmias, convulsions or even death may appear as the first sign of toxicity without any previous warning. Stated differently: *serious toxicity is not reliably preceded by less severe side effects.*

Many patients who require theophylline may exhibit tachycardia due to their underlying disease process so that the cause/effect relationship to elevated serum theophylline concentrations may not be appreciated.

Theophylline products may cause dysrhythmia and/or worsen pre-existing arrhythmias and any significant change in rate and/or rhythm warrants monitoring and further investigation.

The occurrence of arrhythmias and sudden death (with histological evidence of necrosis of the myocardium) has been recorded in laboratory animals (minipigs, rodents and dogs) when theophylline and beta agonists were administered concomitantly, although not when either was administered alone. The significance of these findings when applied to human usage is currently unknown.

PRECAUTIONS: THEO-DUR TABLETS SHOULD NOT BE CHEWED OR CRUSHED

General: Theophylline half-life is shorter in smokers than in non-smokers. Therefore, smokers may require larger or more frequent doses. Morphine and curare should be used with caution in patients with airway obstruction as they may suppress respiration and stimulate histamine release. Alternative drugs should be used when possible. Theophylline should not be administered concurrently with other xanthine medications. Use with caution in patients with severe cardiac disease, severe hypoxemia, hypertension, hyperthyroidism, acute myocardial injury, cor pulmonale, congestive heart failure, liver disease, in the elderly (especially males) and in neonates. In particular, great caution should be used in giving theophylline to patients with congestive heart failure. Frequently, such patients have markedly prolonged theophylline serum levels with theophylline persisting in serum for long periods following discontinuation of the drug. In individuals who are rapid metabolizers of theophylline, such as the young, smokers, and some non-smoking adults, may not be suitable candidates for once-daily dosing. These individuals will generally need to be dosed at 12 hour or sometimes 8 hour intervals. Such patients may exhibit symptoms of bronchospasm near the end of a dosing interval, or may have wider peak-to-trough differences than desired.

Use theophylline cautiously in patients with history of peptic ulcer. Theophylline may occasionally act as a local irritant to the G.I. tract although gastrointestinal symptoms are more commonly centrally mediated and associated with serum drug concentrations over 20 mcg/ml.

Information for Patients: The physician should reinforce the importance of taking only the prescribed dose and time interval between doses. THEO-DUR tablets should not be chewed or crushed. When dosing THEO-DUR on a once daily (24-hr) basis, tablets should be taken whole and not split. As with any controlled-release theophylline product, the patient should alert the physician if symptoms occur repeatedly, especially near the end of the dosing interval.

DRUG INTERACTIONS: **Drug-Drug:** Toxic synergism with epinephrine has been documented and may occur with some other sympathomimetic bronchodilators. In addition, the following drug interactions have been demonstrated:

Drug	Effect
Theophylline with lithium carbonate	Increased excretion of lithium carbonate
Theophylline with propranolol	Antagonism of propranolol effect
Theophylline with cimetidine	Increased theophylline blood levels
Theophylline with troleandomycin, erythromycin	Increased theophylline blood levels

Drug-Food: THEO-DUR 100 mg Sustained Action Tablets have not been adequately studied to determine whether their bioavailability is altered when given with food. Available data suggest that drug administration at the time of food ingestion may influence the absorption characteristics of theophylline controlled-release products resulting in serum values different from those found after administration in the fasting state.

A drug-food effect, if it is likely to have its greatest clinical significance when high theophylline serum levels are being maintained and/or when large single doses (greater than 13 mg/kg or 900 mg) of a controlled-release theophylline product are given.

THEO-DUR (200, 300, and 450 mg) Sustained Action Tablets: The rate and extent of absorption of theophylline from THEO-DUR 200 mg, 300 mg, and 450 mg tablets when administered fasting or immediately after a moderately high fat content breakfast is similar.

Drug-Laboratory Test Interactions: When plasma levels of theophylline are measured by spectrophotometric methods, coffee, tea, cola beverages, chocolate, and acetaminophen contribute falsely high values.

Carcinogenesis, Mutagenesis, and Impairment of Fertility: Long-term animal studies have not been performed to evaluate the carcinogenic potential, mutagenic potential, or the effect on fertility of xanthine compounds.

Pregnancy: Category C—Animal reproduction studies have not been conducted with theophylline. It is not known whether theophylline can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Xanthines should be given to a pregnant woman only if clearly needed.

Nursing Mothers: It has been reported that theophylline distributes readily into breast milk and may cause adverse effects in the infant. Caution must be used if prescribing xanthine to a mother who is nursing, taking into account the risk/benefit of this therapy.

Pediatric Use: Safety and effectiveness of THEO-DUR administered:

- 1 Every 24 hours in children under 12 years of age, have not been established.
- 2 Every 12 hours in children under 6 years of age, have not been established.

ADVERSE REACTIONS: The most consistent adverse reactions are usually due to overdose and are:

- 1 **Gastrointestinal:** nausea, vomiting, epigastric pain, hematemesis, diarrhea.
- 2 **Central nervous system:** headaches, irritability, restlessness, insomnia, reflex hyperexcitability, muscle twitching, clonic and tonic generalized convulsions.
- 3 **Cardiovascular:** palpitation, tachycardia, extrasystoles, flushing, hypotension, circulatory failure, ventricular arrhythmias.
- 4 **Respiratory:** tachypnea.
- 5 **Renal:** albuminuria, increased excretion of renal tubular and red blood cells, potentiation of diuresis.
- 6 **Other:** rash, hyperglycemia and inappropriate ADH syndrome.

OVERDOSEAGE; Management: If potential oral overdose is established and seizure has not occurred

- A Induce vomiting.
- B Administer a cathartic (this is particularly important if sustained-release preparations have been taken).
- C Administer activated charcoal.

If patient is having a seizure:

- A Establish an airway.
- B Administer oxygen.
- C Treat the seizure with intravenous diazepam, 0.1 to 0.3 mg/kg up to 10 mg.
- D Monitor vital signs, maintain blood pressure and provide adequate hydration.

Post Seizure Care:

- A Maintain airway and oxygenation.
- B If a result of oral medication, follow above recommendations to prevent absorption of the drug, but intubation and lavage will have to be performed instead of inducing emesis, and the cathartic and charcoal will need to be introduced via a large bore gastric lavage tube.
- C Continue to provide full supportive care and adequate hydration while waiting for drug to be metabolized. In general, the drug is metabolized sufficiently rapid so as not to warrant consideration of dialysis, however, if serum levels exceed 50 mcg/ml charcoal hemoperfusion may be indicated.

CAUTION: Federal law prohibits dispensing without prescription. For full prescribing information, see package insert. Revised 6/87

Asbestos-Related Disease

HOWARD M. KIPEN, MD, MPH

Since 1940, almost 500,000 individuals in New Jersey workplaces have had substantial occupational exposure to asbestos.^{1,2} It is estimated that over 27 million workers in the United States had some occupational asbestos exposure from 1940 to 1979; presently, over 9,000 asbestos-related cancer deaths occur per year as a result of this exposure.³

The ubiquitous presence of asbestos fiber in construction materials and friction products has provided opportunity for exposures that will extend far into the future. Patient awareness of past and potential exposures, as well as actual disease, engender many questions for medical practitioners. Some of these questions will lend themselves to the familiar medical paradigm, and others will call for a public health or preventive medicine approach.

Requests for reprints may be addressed to Dr. Kipen, Department of Environmental and Community Medicine, UMDNJ-Robert Wood Johnson Medical School, Piscataway, NJ 08854.

A primary practitioner may confront one of the following scenarios in relation to asbestos: 1) he may see and counsel an apparently healthy individual who is concerned about past or present exposure to asbestos; 2) he may have need to advise and counsel an individual who has developed pathology likely to be a result of previous asbestos exposure; or 3) he may see an individual with significant pathology, and need to determine whether or not this relates to previous asbestos exposure.

Asbestos is the common name for a group of naturally occurring, fibrous minerals. Because of excellent properties of thermal resistance, strength, and the ability to be woven, these useful fibers were incorporated into a host of different products: textiles, cement and other building products, paper products, friction materials such as brake linings, and insulation products. People were exposed to the highest levels of fibers in factories during manufacture of these products, and, subsequently, to somewhat lower levels during installation and maintenance.

nance of the materials. For New Jersey, important industries using asbestos include shipbuilding in southern and northern New Jersey, insulation and building product manufacture in southern, central, and northern New Jersey, and installation and maintenance of these products in factories, utilities, and offices throughout the state. Brake repair workers also may be exposed, as well as workers in the newest job category, asbestos removal.

TOXICOLOGY AND EPIDEMIOLOGY

The toxic properties of asbestos, and the human response to it, have made asbestos easier to study than other workplace toxins because of its distinctive "signature" on chest x-ray. Thus, far more is known about the clinical effects of asbestos than most other toxic workplace agents, especially about its potential to cause disease in nonoccupational settings. Asbestos exposure occurs through inhalation and ingestion, but toxicity has only been documented from the former. However, many inhaled asbestos fibers are ingested following clearance from the lungs and upper airways. Asbestos fibers do not produce symptomatic irritation of the upper or lower airways at the time of inhalation. In fact, even for occupationally exposed individuals, it is not common to see clinically apparent disease manifestations in the first 10 to 20 years of exposure, even when exposure was continuous.

The earliest clinical response to asbestos exposure may be a benign pleural effusion. This occurs in approximately 20 percent of industrially exposed workers within 10 to 20 years of onset of exposure, some as early as only a few years from onset. Fre-

quently, the effusion may be subclinical, and the only residual is a blunted costophrenic angle on chest x-ray.⁴

The pathologic response best associated with asbestos exposure is fibrosis, both of the lung interstitium and of the pleura. Although pulmonary fibrosis may be present histopathologically at earlier times, it is not radiographically apparent before 10 years from onset of exposure, and relatively uncommon at 10 to 20 years. Radiographic evidence of fibrosis then becomes more and more common in the third and later decades from onset of exposure, such

that more than half of the individuals in many moderately to heavily exposed groups have developed radiographic abnormalities. This is well documented for a group of New York and New Jersey insulation workers.⁵

Carcinogenesis is the other major toxic response to asbestos exposure with usual latencies from first exposure of 20 to 40 years. One-pack-a-day smokers develop lung cancer about 10 times more often than do nonsmokers. Lung cancer (all cell types) occurs approximately 5 times more frequently in asbestos-exposed insulation workers, when compared with a smoking-matched control group, but over 50 times more frequently when compared to nonsmoking, nonasbestos exposed controls. It is the multiplication of these two risks that results in the astronomical rate of lung cancer mortality among insulation workers—approximately 20 percent. The fivefold relative excess for asbestos exposure alone remains in the small number of nonsmoking workers, but lung cancers are not commonly seen because the baseline rate is so low in nonsmokers.^{6,7}

Mesothelioma of the pleura or of the peritoneum accounts for up to 10 percent of deaths in exposed working populations.⁷ Latency from onset of exposure most commonly is 30 to 40 years. Mesothelioma has no causes established other than asbestos exposure and is not influenced by cigarette smoking.

Cancer of the larynx, colon, esophagus, and stomach have been observed to increase in asbestos-exposed cohorts, with reported increases in the range of 1.5 to two times controls in the largest studies.⁷ The causal role of asbestos for malignancy at these sites is less uniformly acknowledged than for the lung, pleura, and peritoneum.

CLINICAL EVALUATION

The key to evaluating asbestos-related disease lies in understanding exposure. Although no amount of asbestos exposure may be deemed safe from a carcinogenesis point of view, lower amounts of exposure, as in offices or schools, are less likely to produce disease. This especially is true for pleuropulmonary fibrosis.

Occupational histories should focus on the intensity and time of exposure. Indirect exposures to workers such as electricians, sheet-metal workers, and welders have been associated with radiographic abnormalities characteristic of asbestos exposure,⁸ as well as excess mortality from mesothelioma and cancers of the lung and colon.⁹ Questions, therefore, should attempt to depict the workplace around the patient, and what other types of workers often were present. Shipyards and construction sites often have workers from many trades in close proximity. Since family exposures from dusty work clothes have

caused both fibrotic disease and malignancy in asbestos workers' wives and children, such home exposures are important to note.¹⁰ Exposures to asbestos in schools, home basements, and buildings represent a poorly quantified source of exposure without well-studied health outcomes. Although there has been disagreement about the levels of risk posed by such situations, the Environmental Protection Agency (EPA) has required all local education agencies to identify asbestos-containing materials in schools, and to control the release of fibers.^{11,12} Such efforts are directed mainly at reducing cancer risks, since except for some maintenance workers, risks of benign fibrosis are likely to be very low.¹³

Symptoms of asbestos-related disease are the symptoms of restrictive pulmonary fibrosis. When advanced, this fibrosis may be clinically detectable in the lung parenchyma by irregular opacities on chest x-ray, usually in the lower lobes, and with substantial progression, by restrictive changes on lung function tests, or a decrease in the diffusing capacity. Pleural fibrosis may manifest either as discrete plaques on chest x-ray or more diffuse thickening of the pleural lining, often best demonstrated on oblique views. With increasing time from exposure, this pleural fibrosis may become calcified, making it easier to detect on chest x-ray. Bilateral thickening of the pleura has a high predictive value for past asbestos exposure.¹⁴ Depending upon their shape and the presence of calcifications, pleural changes may be almost pathognomonic for asbestos exposure. Physical examination in an advanced stage may reveal limited chest expansion, inspiratory crackles in the lung bases, and clubbing.

Decreased lung volumes, characteristic of restriction, and an impaired diffusing capacity are the classic pulmonary function changes of asbestosis. However, other forms of pulmonary fibrosis may cause similar patterns of abnormalities, and interpretation of pulmonary function tests (PFT) often is complicated by smoking-induced changes of obstruction.¹⁵

BIOPSY MATERIAL

Transthoracic and transbronchial lung biopsy usually are not successful in obtaining enough tissue for histologic diagnosis of asbestosis. In addition, the lesions of asbestosis may be irregularly distributed, causing the diagnosis to be missed unless tissue sampling is directed; however, unless ruling out treatable disease such as sarcoidosis, open biopsy rarely is warranted.¹⁶ When tissue is obtained incidentally, as it is during workup or resection of a pulmonary mass lesion, the clinician should discuss concern for the presence of asbestosis with the pathologist, aiding in the search for pathologic

evidence of asbestosis. Asbestos bodies may be difficult or impossible to demonstrate, especially on routine tissue sections,¹⁷ and chrysotile, the most prevalent form of asbestos, is least likely to produce large numbers of the coated bodies.

COMMON CLINICAL SCENARIOS

1. For the Apparently Healthy Individual with Exposure. The clinician must consider whether asbestos truly has been present, and whether it has been respirable if present. Although no amount of asbestos exposure can be considered safe from a carcinogenic risk perspective, less is better than more, and a lifetime cumulative exposure threshold of 10 to 25 "fiber-years" for clinically significant asbestosis has been suggested.¹⁸ Occupational exposures usually are higher (in fiber concentrations in the air) than nonoccupational environmental exposures. Assess the number of hours per day, days per week, weeks per year, and years that a person has had an exposure. Were there any mitigating factors, such as ventilation, wetting, enclosure, or respirators? Were the respirators maintained and fit-tested? Were OSHA and EPA regulations adhered to on the job?

Based on the cumulative threshold, residential exposure, such as that from basement insulation, rarely will be of concern vis-a-vis asbestosis, but cancer risk remains a concern.

From the clinical point of view, one needs to assess whether the absence of disease in this case is meaningful, or is the latency too short to expect disease? Ten years of heavy exposure is likely to cause disease, but not before a latency of 20 to 30 years.

If the latency and exposure is sufficient to permit detectable abnormalities, one needs to assess whether or not it is truly absent. An asymptomatic person may have irregular opacities on chest x-ray. Spirometry may be normal in the face of an impaired diffusing capacity. Pleural thickening may be visible only if oblique films are taken. Frequently, mild disease will be seen as an indicator of exposure, but without apparent impairment. If an individual truly has had significant exposure, he is likely to be at some increased risk for future malignancy whether or not any disease is detectable. The quantitation of this risk and its dose-response relationship are the basis for much continued discussion.¹⁹

Counseling such individuals is difficult. If the patient has not had occupational exposures for extended periods, especially prior to the 1970s, individual risks of developing an asbestos-related cancer will not be very great. This is not to say that the risks for lung cancer in a population of similarly exposed people would not be elevated. The most important recommendations include smoking cessa-

tion to reduce the substantial carcinogenic risks, and minimization of future exposure.

2. For the Individual with Fibrotic Disease. Goals for this patient will be similar to that for any chronic and incurable lung condition, including prevention and early treatment of superinfection. Future exposure should be minimized, although it often is not realistic for a middle-aged person to change occupations. Smoking cessation is of even greater benefit than in other lung conditions because of the multiplicative interaction with asbestos exposure in effecting carcinogenesis. Controlled chemoprevention trials of anticarcinogens such as retinoids are being performed.

Compensation will be available to many such individuals, and if the physician suspects a potentially work-related illness like asbestosis or a malignancy, the patient needs to be so advised, as he may have a limited amount of time to initiate a claim.

3. For the Physician Ascertaining Whether a Case of Pulmonary Fibrosis or Lung Cancer is Related to Asbestos. Exposure history is very im-

portant. It often is necessary to review previous exposures or jobs. In the case of lung cancer, the presence of pleuropulmonary fibrosis can be a rough indicator of previous asbestos exposure, although the x-ray and other modalities have limited sensitivity for its detection when compared to expert tissue examination.^{20,21} The fact that cigarette smoking is a powerful determinant of lung cancer incidence does not discount the effects of asbestos, and in the presence of both exposures, many tumors will be attributable to both exposures.

CONCLUSION

Since 1946, five successively lower occupational standards for asbestos exposure have been promulgated in the United States. It is hoped that the current standard of 0.2 fibers/cc of air (200 fibers/liter) will reduce risks to an acceptable level. Unfortunately, the latency of asbestos-induced health effects is such that New Jersey clinicians will be confronting disease from previous exposures for many years. ■

that’s really listening to me?**

**I don’t
believe it.”**

**Believe it!
Medallion.
From Blue Cross and Blue Shield.**

We listened to you because we all share a common concern—the welfare of your patients.

After listening to your needs, we’ve developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you’ll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We’re eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey’s medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate with Blue Cross and Blue Shield.

If you’re not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Call 1-800-842-BLUE for more information. Of course, there’s no obligation.

The best insurance for a healthy practice.

Indoor Air Pollution

PAUL J. LIOY, PhD
ELAINE PANITZ, MD

The presence of airborne contaminants in the indoor environment is not a new phenomenon. The magnitude and scope of the problem, however, have changed in the last decade to the point where health effects and/or symptoms have been observed in both residences and office buildings (tight building syndrome). Because of the extent to which indoor pollution has become a problem, the physician must be aware of the situations that could lead to high exposures and related patient complaints, e.g. involuntary smoking and infant illness, and neurophysiological symptoms to formaldehyde. The reasons for the accumulation of high concentrations of some pollutants and the introduction of new pollutants primarily are twofold: the reduced ventilation and increased insulation in buildings to improve energy efficiency, and the use of synthetics in building materials and furnishings.¹ To further aggravate the situation, it has been noted that people in the United States spend more than

70 percent of their time indoors with employed adults averaging less than 45 minutes outdoors.² Those individuals spending the greatest time indoors within private residences are potentially the most susceptible groups, i.e. the old, infants, the infirm.³

Physicians are involved with patients affected directly by acute responses to indoor chemical exposures with the frequency being single or multiple in nature. In the following sections, we will outline the nature of major compounds and compound classes of concern and their sources. We also will present a case study describing the clinical features of the sick building syndrome. Finally, we present a checklist to assist physicians in evaluating patients with suspected indoor pollution-related symptoms.

INDOOR POLLUTANTS AND EXPOSURE

The indoor pollution problem is complicated by the extensive number of contaminants present; many of these are associated directly with indoor sources. At times, especially during the warmer seasons, outdoor pollutants also will penetrate indoors. A list of the more common indoor contami-

Requests for reprints may be addressed to Dr. Liroy, Division of Exposure, Measurement, and Assessment, Department of Environmental and Community Medicine, UMDNJ-Robert Wood Johnson Medical School, Piscataway, NJ 08854.

nants is found in the Table. These materials are not present in all homes; however, the sources are quite common. Thus, there is a possibility of having individuals exposed to one or more of these substances on a regular basis.

Volatile Organics. A major group of chemicals is the volatile organics which accumulate indoors from various sources including: solvents, e.g. chlorinated hydrocarbons; personal toiletries; synthetic fibers, e.g. carpeting; drycleaned clothes; glues and epoxy; and particle board. Single or multiple compounds will be emitted from a given source.⁴

The different classes of volatile organic compounds manifest their effects in four major categories: 1) odors and their psychophysical effects (such as sensory irritation); 2) irritation (respiratory tract and mucous membranes) and other morbidity associated with systemic toxicity; 3) menstrual dysfunction and genotoxicity; and 4) carcinogenicity. Volatile organics are considered to be one of the main groups of compounds associated with the tight building syndrome.

At present, major research programs are being conducted to characterize volatile organic emissions from consumer products. The results should provide fingerprints and/or unique tracers to identify a source and identify those compounds which are known to be of importance to public health.⁵

A research project directed at the characterization of indoor air is the total exposure assessment methodology (TEAM) study performed by the Environmental Protection Agency (EPA) which is examining population exposure to volatile organics in a number of different locales.⁶

Combustion Products. The substances emitted from combustion sources are a complex mixture of gaseous and particulate species. For example, nitrogen dioxide, an irritant for the upper airways of the lung and benzo(a)pyrene, a known carcinogen, can be emitted simultaneously during combustion. Except in the extreme circumstances, such as a clogged furnace flue or a poorly operated fireplace, most of the substances commonly emitted within a home or office are from unvented sources; some sources are intermittent seasonal use devices, such as unvented kerosene space heaters, while the typical sources are cigarettes and/or a gas range. Other indoor combustion sources are vented coal burning and wood burning stoves.

Combustion products vary from residence to residence, depending upon the lifestyle of the inhabitants. In Figure 1, the levels of benzo(a)pyrene measured in inhalable particulate matter of $\leq 10 \mu$ in diameter were found indoors for ten homes and were found simultaneously outdoors at three sites.¹⁰ The data indicate a wide variation in exposures with

some homes showing higher indoor levels and others having levels similar to the outdoor values. The annotations on Figure 1 show the highest levels were associated with a specific indoor personal activity, such as smoking, paint removal, or coal stove use.

Side-Stream Tobacco Smoke. In the case of cigarettes and other tobacco products, the exposure to inhabitants, apart from the smoker, is from the generation of side-stream tobacco smoke. Studies have linked increases in childhood illnesses and other cardiorespiratory illnesses with situations where the child was exposed to side-stream smoke and, thereby, participated in passive smoking.^{8,9} Previous studies have shown that exposures to active and passive smoke contaminants are different both in concentration and composition.⁷ The compounds can be more toxic or carcinogenic in side-stream smoke. However, the contaminant concentrations will be much higher in mainstream smoke.

Formaldehyde and Asbestos. Formaldehyde and asbestos are special problems associated with home insulation. The former began in the mid-1970s when the general population was concerned seriously with energy conservation.^{5,6} At that time, homeowners had urea-formaldehyde foam blown into walls for added insulation, and the unbinded colorless formaldehyde gas was released into the home. Since then, the practice has declined substantially. Today, formaldehyde is released primarily from common household and office furnishings, carbonless copiers, cigarette smoke, and carpets. The range of concentrations is shown in the Table for mobile homes and homes with wallboard. Formaldehyde is soluble in water and, thus, can irritate the mucous membrane of the eye and upper respiratory system. Formaldehyde produces nasal cancer in animals, but further studies are necessary to determine carcinogenicity in man.

Asbestos is another contaminant released from insulation, but it usually is of concern because of flaking and rupturing of pipe and wall insulation in older public buildings and private homes. At present, asbestos is removed or encapsulated, depending upon the degree of contamination. The etiology of the asbestos-related diseases (asbestosis and lung cancer) is long term in nature. Measured indoor and outdoor levels of asbestos usually average 0.004 filters/cc and five times those levels are found in schools with asbestos insulation problems. At these levels, abnormalities will not be observable in a clinician's chest x-ray; however, there is a risk for malignant diseases.

Radon. Actual radon levels observed indoors are dependent upon the ability of radon to penetrate from surrounding soil or from building materials. The infiltration primarily is by diffusion caused by

Table. Typical indoor pollutant concentrations.*

Pollutants of Concern	Concentration (Sampling Time)	Location	Types of Sources
Carbon monoxide, CO	2.5-28 ppm	Offices, restaurants, bars, arenas	Combustion equipment, engines, stoves, faulty heating systems
	3.1-7.8 ppm (seasonal averages of 12 h samples)	Kitchen of homes with gas stoves	Combustion, gas stoves, water heaters, dryers
Nitrogen dioxide, NO₂	0.005-0.317 ppm (1 wk)	English homes with gas cookers,	Combustion, gas stoves, water heaters, dryers, cigarettes
	0.005-0.11 ppm (24 h)	American homes with gas stoves,	
	<0.06 ppm (24 h)	American homes with electric stoves	
Respirable particles, RP	100-700 µg/m ³ (8-50 min)	Restaurants, sports arenas, residences with smoking and without smoking, residences	Stoves, fireplaces, cigarettes, condensation of vapors, sprays, combustion cooking
	20-60 µg/m ³ (1-42 min)		
	10-70 µg/m ³ (24 h)		
Total suspended particles, TSP	39-66 µg/m ³ (averages of 12 h samples; 26-72% of outdoor concentrations)	Homes, public buildings	Dust, resuspended particles, sprays, respirable particles
	2.7-79.4 µg/m ³ (48 h)		
Asbestos	0-100 ng/m ³ (0-2 x 10 ⁴ fibers/m ³) (5 min to 10 h)	Normal activities, during maintenance	Fire retardants, thermal tiles
	20 x 10 ⁶ fibers/m ³		
Organic compounds	Varies depending upon compound		Smoke, paints, solvents, cosmetics
Formaldehyde, HCHO	60-1673 ppb (1 h; 463 ppb average for all measurements)	Homes with chipboard walls, mobile homes	Particle board, furnishings, product binder insulation, tobacco smoke
	30-1770 ppb (35-60 min)		
Ozone, O₃	<0.002-0.068 ppm (40 min to 2 h)	Photocopying machine, homes with electrostatic air cleaners	Photocopying, (primary outdoor outdoor filtration)
	<0.002-0.018 ppm (30 min)		
Radon	0.01 to 80 pCi/l (various)	House in U.S. including New Jersey and Pennsylvania, house on Florida reclaimed phosphate land	Building construction material, contaminated soil, natural crustal material
	<25-34 pCi/l (averages of 3-to-6 min samples)		
Benzo(a)pyrene	7.1-21.0 ng/m ³ (2-4 h)	Sports arena, homes in New Jersey	Combustion, cigarette smoke, stoves, cooking
	0.1-9.0 ng/m ³ (24 h)		
Carbon dioxide, CO₂	0.086% (5 min)	Lecture hall, school room, nuclear submarines	Metabolic activity, combustion
	0.06-0.25%		
	0.9% (continuous measurements for 8 weeks)		
Table particles	20-700 CFP/m ³ (averages of 10-minute samples taken every 40 minutes)	Schools, hospitals, residences	Infections, fungi, molds, spores

*Adapted from Wadden RA, et al.: *Indoor Air Pollution*.³

pressure/temperature differences between indoors and outdoors, and changes in wind speed.¹¹ No unequivocal estimates of exposure can be made; however, there are major areas of New Jersey in which radon testing has been done, and maps have been developed to illustrate the geographical extent of exposure.¹² A range of encountered radon levels is found in the Table. Some homes in New Jersey have been found to be above the occupational exposure limit for radon and its progenies.¹³ The risk estimates for cancer made by various organizations indicate that radon could be associated with a major fraction (20 percent) of the nonsmoking-related lung cancer.¹⁴

Viable Particles. In addition to the exposures related to chemical contaminants indoors, there are exposures to viable materials, such as mites, bacteria, viruses, and molds. These are common materials which have similar and/or equivalent mechanisms of dispersal and exposure to the chemical contaminants. In a clinical setting, these are manifested by infections or by hypersensitivity, e.g. sinus, pneumonitis, Legionnaire's disease, *Aspergillus* infections. For some of these situations, the physician requires resources to equate observed health effects

and symptoms with the sources and concentrations of specific viable particles.

CASE REPORT

A 40-year-old white, female, nonsmoker was a long-term employee in a large New Jersey corporation. Her past medical history was significant for occasional "sinus trouble." In October, she and 400 other employees began work in a new office building. The staff complained that the office air seemed stale.

Within a week, the patient noticed burning of the eyes, redness of her face and anterior neck, and a postnasal drip while in the building. After several weeks, the patient complained of sore throat, hoarseness, chest heaviness, and palpitations at the end of each work day. Her symptoms were most apparent when she worked overtime or failed to leave the building at lunch time. She developed "soreness" in the forehead area and complained of headaches that were poorly responsive to over-the-counter analgesics. Her lips and hands were chapping, and she no longer could tolerate wearing her contact lenses. Her nose burned and itched continually, and she was out of work for "colds" three times in four weeks. During

Figure 2. Building-related illness checklist.*
*Adapted from Godish T: Recognition of building-related illness.¹⁷

her third "cold," six weeks after beginning work in the new building, she saw her family physician.

On physical examination she was afebrile, mildly hypertensive (150/95), tachycardiac (105-110), and showed evidence of conjunctival, nasal, and pharyngeal irritation. There was a small amount of clear posterior pharyngeal drainage. Her face was slightly erythematous and puffy, especially about the eyes and nose. The remainder of her examination was unremarkable. Complete blood count, automated chemistry screening, erythrocyte sedimentation rate, urinalysis, chest x-ray, spirometry, and sinus x-rays were normal. Electrocardiogram revealed only sinus tachycardia. Her physician felt that she was allergic to something in her environment. He prescribed Actifed® one tablet three times daily and erythromycin 250 mg four times daily for one week.

With medication she improved, but symptoms recurred on return to work: her menstrual periods had tapered off and became almost nonexistent, she felt lightheaded and nauseated, she had difficulty concentrating on her work, she had become very emotional, and she was continually exhausted.

The family physician reviewed the patient's symptoms for the past four months, and noted the relationship of symptoms to her work in the new building. She was assigned temporarily to a branch office and within several days, the patient noted decreased eye and respiratory irritation. After a time, her menstrual period returned, her emotional lability gradually improved, and she experienced improved ability to think and concentrate. Blood pressure and pulse returned to normal.

Similar complaints from the patient's coworkers were the impetus for a confidential health questionnaire. There were 347 (90 percent) respondents in the headquarters building, and 230 (76 percent) respondents from branch offices. Frequent or daily eye irritation was reported three times more often and skin irritation almost five times more often, in the headquarters building, compared to the branch offices. Symptoms of upper and lower respiratory tract irritation and illness, and central nervous system symptoms were reported almost three times more often in the headquarters building. Menstrual irregularity was reported more than four times more

often among women in the headquarters building, compared to women in the branch offices.

The headquarters building had been constructed within the past two years; approximately 80,000 square feet of wall-to-wall nylon carpeting had been installed with a rug adhesive, and sprayed with an ammonium chloride anti-static agent, the walls had been painted with latex, alkyd, and enamel paints, desks were laminated pressed particle board (70 percent urea formaldehyde), and the office design was open. Desks held bond paper, carbonless copy paper forms, and typewriter correction fluids. Employee smoking had been prohibited.

Volatile organic hydrocarbons consistently were nondetectable (less than 0.1 ppm) by chemical detector tube analysis, although continuous gas chromatographic results ranged from 0.25 to 3.50 ppm (background levels usually 0.20-0.40 ppm). Formaldehyde air levels were 0.10-0.20 ppm, which are one-tenth the occupational guideline (normal: 1 ppm). Acetaldehyde levels averaged 20 ppm (normal 100 ppm). Sulfur dioxide and oxides of nitrogen levels were nondetectable. Carbon monoxide levels were 3 to 4 ppm (recommended levels are less than 35 ppm). Carbon dioxide levels averaged 890 ppm, with levels as high as 1300 ppm (simultaneous outdoor levels averaged 350 ppm). Airborne bacterial and fungal counts ranged from nil to 1.112 colonies/m³. Airborne fiberglass levels were nondetectable. Nuisance dust levels were very low. Testing of

furniture, fixtures, paint, carpeting, and other materials failed to reveal unusual or excessive chemical off-gassing. Water testing from fountains and kitchenettes was negative for coliforms.

Evaluation of the heating, ventilation, and air conditioning system revealed that the work areas were receiving fewer than 4 air changes per person occupancy per hour (more than 15 air changes per hour recommended).

No airborne chemical, physical, or biologic agents were detected in amounts that exceeded occupational standards. However, the values for volatile organics, carbon dioxide, and formaldehyde were present in levels at least three times greater than outdoor air. Since these indoor pollutants accumulated, the results support the finding of inadequate air changes per person occupancy per hour. The constellation of employee symptoms, commonly referred to as tight building syndrome^{15,16} appears to have resulted from accumulation of common indoor irritants from furniture outgassing, and the diffusion of gases from the adhesives used on carpets in the offices.

A patient questionnaire (Figure 2) has been designed to assist the physician in evaluating a patient suspected of suffering from building-related illness. Recognition of the syndrome will allow efforts to be directed at improved ventilation, and, if necessary, assist you in recommending removal of your patient from the offending building. ■

4000 PATIENTS AND THEIR PHYSICIANS HAVE USED OUR LITHOTRIPTER SERVICE.

In a field where experience is often measured in days or months, the Mid-Atlantic Kidney Stone Center stands apart. With three years of expertise as a lithotripsy service, we have treated 4000 kidney stone patients resulting in a high degree of confidence by referring physicians in New Jersey, Eastern Pennsylvania, metropolitan New York, and Delaware.

Our concern for the patient's well-being is central to our concept of good patient care. Our

professional staff prepares the patients for every aspect of treatment with warmth and understanding. We spend a great deal of time with patients to reassure them and explain the procedure. And patients appreciate the personalized care of the Mid-Atlantic Kidney Stone Center.

Our relationship with referring physicians ensures quality care by providing timely

communications during your patient's treatment. In addition, we are available 24 hours a day for pre- and post-treatment consultation. We believe this cooperation between the referring urologist and the staff at Mid-Atlantic is essential to effective treatment and recovery. To find out more about our service, or to obtain staff privileges at the Mid-Atlantic Kidney Stone Center, call (609) 983-7337 or (800) 53-LITHO.

DOCTORS' BILL

The "collateral source" bill passed by the New Jersey Legislature and signed into law by Governor Kean is a significant victory in the Exchange's efforts to reform the medical malpractice legal system. The Exchange provided the leadership to give New Jersey physicians one of the strongest new laws of its kind in the nation. Elimination of some costly inequities in our tort system will help moderate the ever-increasing severity of insurance losses.

Chemical and Dust-Related Diseases

MARTHA STANBURY, MPH
KENNETH D. ROSENMAN, MD

How many people in New Jersey become ill from chemical or dust-related diseases? Under what circumstances are these people being exposed to chemicals and dust? Will additional individuals become ill from the same exposures? What actions should be taken to prevent additional illnesses? If you feel you are guessing when you answer these questions, you are doing what the experts in this field often do. The surveillance programs needed to identify who and how individuals are becoming sick from chemicals and dusts are just in their infancy.

During the 1900s, surveillance systems have been a basic tenet of controlling and preventing communicable disease. No such surveillance systems currently exist for chemical or dust-related diseases despite the great concern and fear about the health effects of chemicals. This problem is not unique to New Jersey; however, it reflects the absence of any comprehensive surveillance program at either the state or national level.¹ State health departments can and should play a critical role in chemical and dust-disease surveillance. The departments can provide centralized data collection systems and re-

sources for public health interventions designed to eliminate exposures to causative agents and they can assist local physicians in diagnosing and treating these conditions by providing consultative services with preventive medicine experts, evaluations of patients' chemical exposures at work and in the community, and continuing medical education programs.

The New Jersey State Department of Health (NJDOH) has initiated a number of programs to assess the magnitude of the health consequences of exposure to chemicals and dusts. This paper describes the components of current surveillance programs which are based on secondary data sources, including hospital and laboratory reporting and vital records. Deficiencies in current surveillance activity and the need for additional involvement of physicians are discussed. The usefulness of the information collected for diagnosis and management of individual patients is explored. A case report is provided that illustrates the importance of physician involvement in surveillance activities for the prevention and control of chemical and dust-related disease.

SURVEILLANCE AT NJDOH

Hospital Reporting. Funded since 1984 by the National Institute for Occupational Safety and

Requests for reprints may be addressed to Ms. Stanbury, Division of Occupational and Environmental Health, New Jersey State Department of Health, CN 360, Trenton, NJ 08625.

Table 1. Results of medical record review of patients reported by hospitals to have the discharge diagnosis silicosis.

Medical Record Review	Cases	%
Diagnosis of silicosis confirmed by review of x-ray and/or biopsy report	83	54
Diagnosis of silicosis confirmed by review of x-ray report	38	25
No evidence in records to confirm or negate diagnosis of silicosis	3	2
X-ray or medical records review either indicated normal x-ray or linear opacities	29*	19
Total	153	100

*Thirteen of the individuals with linear opacities on their x-ray were considered more likely to have asbestosis.

Health (NIOSH), NJDOH has used hospital reports from the DRG system to conduct a pilot surveillance project for silicosis. Patients identified from the DRG system with a discharge diagnosis of silicosis are interviewed to determine the names of workplaces where exposure to silica took place, and to obtain consent to review medical records. Medical records of consenting individuals, including chest x-rays, are examined in order to confirm the case diagnosis and to assess the severity of disease.

Information also is gathered on current workplace users of, and employee exposures to, silica from industrial hygiene data provided by the Occupational Safety and Health Administration (OSHA) and the Mine Safety and Health Administration. Current silica users then are visited by NJDOH industrial hygienists who conduct walkthrough evaluations and interviews with employers and employees about exposures, medical surveillance programs, and hazard control. Written reports with recommendations for hazard control are issued and sent to the treating physicians.

Between 1979 and 1987, 529 individuals diagnosed with silicosis have been identified. A review of their work histories indicated that 94 (18 percent) were considered more likely to have had coal worker's pneumoconiosis and 10 (3 percent) were considered to be coding errors by the hospitals. One hundred fifty-three medical records have been reviewed. Evidence for the diagnosis of silicosis was found in 121 (79 percent) of the medical records. Of the 29 (19 percent) cases in which silicosis could be ruled

out, asbestosis was considered to be the most likely disease in 13 (9 percent) individuals (Table 1). Medical screenings of all employees at 2 of the 28 workplaces followed up resulted in the diagnosis of 27 additional silicosis cases by health department physicians.

Of the 142 workplaces identified from patient interviews, 68 workplaces have been identified as current silica users. Twenty-eight workplaces have been evaluated by NJDOH industrial hygienists. The most common problems identified by the industrial hygienists have been inadequate ventilation, inadequate workplace practices for dust cleanup, use of the wrong respirator, and the absence of proper medical surveillance for current employees.

Employer cooperation in following NJDOH recommendations has been good. Recontact with 12 of the employers initially visited has revealed that 8 employers have implemented recommendations made by NJDOH. NJDOH is continuing to work with employers to ensure that employees are adequately protected from silica dust.²

Hospital reports also have been used for surveillance of other lung diseases and poisoning related to chemicals or dusts. In 1985, a total of 2,169 individ-

uals were reported by hospitals to have a chemical or dust-related disease. One thousand one hundred nineteen individuals were reported with chronic occupational lung disease, i.e. coal worker's pneumoconiosis, asbestosis, silicosis, other pneumoconiosis; 243 individuals with an acute lung condition; and 807 persons with a chemical poisoning (Table 2). The number of reports is an underestimate of the true number of cases because many people with these conditions do not enter a hospital. Identification of individuals and their workplaces was facilitated in October 1985 by a state regulation requiring hospitals to report to NJDOH names and medical record numbers of patients with the discharge diagnoses listed in Table 2. Activities similar to those for silicosis currently are being initiated for some of the acute lung conditions and poisonings.

Laboratory Reporting. In October 1985, regulations were adopted that require all clinical labora-

tories to report to NJDOH elevated blood and urine levels in adults of four heavy metals: lead (blood levels $\geq 25 \mu\text{g/dl}$, urine levels $\geq 80 \mu\text{g/l}$); mercury (blood levels $\geq 2.8 \mu\text{g/dl}$, urine levels $\geq 20 \mu\text{g/l}$); arsenic (blood levels $\geq .07 \mu\text{g/dl}$, urine levels $\geq 100 \mu\text{g/l}$); and cadmium (blood levels $\geq 5 \mu\text{g/l}$, urine levels $\geq 10 \mu\text{g/l}$). As of December 1987, a total of 2,629 blood and urine reports have been received. The majority of reports are for lead, which is the only metal for which federal OSHA regulations require biological monitoring. The 2,135 blood lead reports represent 1,150 different individuals. Sixty-seven percent of the blood lead reports have been between $25 \mu\text{g/dl}$ and $39 \mu\text{g/dl}$, 30 percent have been between $40 \mu\text{g/dl}$ and $69 \mu\text{g/dl}$, and 3 percent have been above $70 \mu\text{g/dl}$ (Table 3).

One hundred seventeen lead-using workplaces have been identified from laboratory reports and contact with reported individuals. Adults reported

Total	226	440	666

with elevated blood lead levels receive a letter containing information about the health effects of lead and a followup interview to determine the source of exposure and information about medical care.

The protocol for industrial hygiene followup at lead-using workplaces is similar to that for silicosis. As of December 1987, 19 lead- and 5 mercury-using workplaces have had some level of industrial hygiene intervention. As with silica workplaces, inadequate ventilation, work practices, housekeeping, and respirator use have been found to be the most common problems. In the case of a secondary smelter where 16 workers had blood lead levels ranging from 32 $\mu\text{g}/\text{dl}$ to 72 $\mu\text{g}/\text{dl}$, dust was swept with dry brooms and respirators were used inconsistently. Following industrial hygiene evaluation by the NJDOH, implementation of better control measures and respirator use resulted in dramatically lowered blood lead levels.

Vital Records. NJDOH uses death certificates, birth records, and cancer registry data for trend surveillance and to generate hypotheses about the associations between suspected exposures to dusts or chemicals and disease outcomes.

Death certificates contain underlying and contributing causes of death that are coded and computerized. For the years 1979 to 1985, dust diseases of the lung caused 226 deaths in New Jersey and contributed to deaths in 440 additional cases (Table 4). New Jersey will begin coding occupational information of the deceased on death certificates and that of parents on birth certificates in the next year, so that cause-specific disease patterns by occupation and industry can be tracked. Other states already conduct this kind of surveillance activity.⁴

The New Jersey Cancer Registry is one of the nation's Surveillance Epidemiology and End Results (SEER) registries and histologically confirms all incident cancer cases in the state. A study to identify

associations between occupations of individuals with cancer and specific cancer outcomes has been carried out.⁵ Findings from this study include increased lung cancer and mesothelioma among workers in many industries which use asbestos; increased bladder cancer among workers in clothing manufacturing; and leukemia and lymphoma among chemical-exposed workers.

Physician Reporting. Although most of the surveillance programs at NJDOH do not rely on direct physician reporting to the health department, they are dependent on involvement of physicians in the recognition of the chemical or dust cause of a patient's symptoms and the accurate completion of a hospital discharge summary, birth, or death certificate. The importance of increased physician education and awareness regarding diagnosis of chemical or dust-related disorders is recognized.^{6,7}

NIOSH, the branch of the Centers of Disease Control responsible for research in chemical and dust-related diseases at work, has initiated several activities. NIOSH has been involved in a variety of physician education projects, and it also has developed standardized diagnostic criteria and epidemiologic case definitions for certain conditions. In addition, NIOSH recently funded ten state health departments, including New Jersey, to develop physician reporting systems. The system is centered around a network of "sentinel providers" who report selected conditions to a state health agency. NIOSH calls this project "Sentinel Events Notification System for Occupational Risks" (SENSOR).

A "sentinel provider" is a physician who either is representative of all practicing physicians in a defined area, or who sees a relatively large proportion of patients with a particular condition. In New Jersey, pulmonologists, allergists, and other physicians are being approached for their cooperation in the SENSOR project. The NJDOH SENSOR project

Table 5. Exposure to occupational allergens: Estimated population at risk in New Jersey.

Industry or Occupation*	Agent or Agents*	Number of Workers**

encompasses surveillance of silicosis and occupational asthma.

Physician reporting of silicosis to the NJDOH is the logical next step for the NJDOH silicosis surveillance project. The health problem is well-documented; successful workplace intervention

strategies have been developed; and the need for improved diagnostic accuracy has been demonstrated. Followup medical screenings in a limited number of plants have documented that most people with silicosis are not hospitalized for the condition and, thus, are not included in the current surveil-

lance system which is based on hospital reports.

Occupational asthma is a more problematic condition to diagnose. Asthma is a common condition, and occupational asthma can only be distinguished from nonoccupational asthma by occupational asthma's temporal association with chemical exposure. Unless a work history or assessment of exposure is made, the diagnosis easily can be overlooked. Occupational asthma is a potentially significant health problem in New Jersey. There are an estimated 165,000 workers at risk from occupational exposure to allergens (Table 5). Each year, there are approximately 8,500 admissions to New Jersey hospitals for adults with asthma; it is estimated that 5 to 16 percent of these are occupationally related.

SENSOR

Diseases caused by exposure to chemicals or dusts are almost always preventable so long as the causative agents are recognized. The diagnosis of an index case by the astute health practitioner often can be the event that initiates public health prevention and control measures at the source of exposure. As with surveillance of infectious diseases, there needs to be a link between the diagnosing physician and the public health response capabilities at the State Department of Health.

The New Jersey State Department of Health, in cooperation with physicians at the Robert Wood Johnson Medical School, has begun pilot programs for surveillance of occupational asthma and silicosis based on voluntary physician reporting. The New Jersey State Department of Health has identified sentinel physicians in the state who are likely to see patients with those conditions. These physicians are being asked to report patients with occupational asthma or silicosis to the State Department of Health. In turn, the physicians from the medical school will provide diagnostic consultation to the sentinel physicians, and the industrial hygienists from the State Department of Health will determine the sources of exposure to causative agents and recommend procedures for their control.

This surveillance program, called SENSOR ("Sentinel Events Notification System for Occupational Risks"), is being funded in ten states by the Centers for Disease Control in order to demonstrate the effectiveness of active surveillance of certain chemical and dust diseases. Recognition of suspected causative agents by the diagnosing physician linked with public health investigations from the State Department of Health are essential for reducing the burden of these diseases in New Jersey.

For additional information on SENSOR, write Martha Stanbury, NJDOH, CN 360, Trenton, NJ 08625 or call 609/984-1863. For questions about individual patients, call Dr. Howard Kipen at the Robert Wood Johnson Medical School, 201/463-4982.

The New Jersey State Department of Health has been involved in several detailed medical and industrial hygiene evaluations of workers exposed to allergens that have documented the problem at specific worksites.⁹⁻¹²

CASE REPORT

A 28-year-old white male complained of difficulty breathing. His allergist performed various intradermal skin tests which were 2 plus positive for inhalant mix, wool, feathers, ragweed, and Kapock, and 1 plus for tree mix, grass mix, weed mix, and cat and rabbit dander. Sinus films showed mucosal thickening of the ethmoid and maxillary sinuses. His chest x-ray was normal. The allergist prescribed terbutaline and prednisone.

SURVEILLANCE FOR OCCUPATIONAL ASTHMA IN NEW JERSEY

Do you have patients with asthma where you suspect a chemical exposure is the cause? There are approximately 8,500 hospital admissions for adults with asthma in New Jersey. The actual percentage secondary to chemical exposure is unknown, although estimates in the medical literature range from 5 to 16 percent in New Jersey. There are approximately 150,000 individuals working with known allergens. Examples of occupations with exposure to allergens include: laboratory workers (animal danders, insect parts); antibiotic manufacturers (penicillin); detergent manufacturers (*Bacillus subtilis*); precious metal users (platinum); bakers (flour dust); printers (gum arabic, ink ingredients); chemical and plastic manufacturers (MDI, TDI anhydrides).

The New Jersey State Department of Health and the Robert Wood Johnson Medical School have initiated a program to assess the frequency of occupational asthma and to provide support services to individual practitioners. Services offered to practitioners concerned with potential chemical causes of asthma in their patients include telephone consultations with occupational medicine specialists, determination of chemical exposures and levels of exposure, RAST testing for specific chemicals, and reprints of pertinent medical articles. In return, the State Department of Health is asking practitioners to report occupational asthma cases. Even if these services are not needed, the State Department of Health needs to receive case reports in order to identify fellow workers with similar problems who may need medical care or who are at risk of becoming symptomatic.

For additional information on occupational asthma write Martha Stanbury, NJDOH, CN 360, Trenton, NJ 08625 or call 609/984-1863. For questions about individual patients, call Dr. Howard Kipen at the Robert Wood Johnson Medical School, 201/463-4982.

The patient then referred himself to an occupational physician believing work exposures to be the cause of his asthma. The patient had no history of allergy, hay fever, or asthma; he smoked one pack of cigarettes a day.

For three years he worked at a chemical manufacturing plant. After his first year, he was transferred to an area where he emptied bags of himic anhydride, a fire retardant ingredient. Immediately, he began to sneeze; he developed a cold sweat, swelling, redness, and hives around his eyes. He was transferred out, but three months later he experienced swelling of his face and developed hives when transferred back, and in contact with himic anhydride. He was transferred out again, but one year later the bag emptying operation was moved to his area. Six months later, he experienced three separate asthma attacks for which he had seen an allergist.

Upon physical examination, his lungs were clear and pulmonary functions were normal. The patient's white count was 7,300 with 1 percent eosinophils. Radioallergosorbent assay (RAST) for himic anhydride was markedly abnormal. The patient did not return to the plant. His symptoms gradually resolved; one year later he was asymptomatic without medication.

A followup survey at the manufacturing plant found additional symptomatic individuals with positive RAST and skin prick tests. Although engineering controls had been instituted at the plant, additional controls were considered necessary because of the presence of symptomatic individuals.

This case report illustrates the importance of considering chemical exposures, evaluating individuals exposed similarly, and conducting followup investigations to improve controls to reduce exposures.

CONCLUSIONS

The New Jersey State Department of Health is encouraging physicians to consult with specialists and to report index cases, allowing for the initiation of public health investigations to determine the occurrence of other symptomatic individuals and the types and magnitudes of exposures. Funding from NIOSH for the SENSOR project is promoting this activity. NIOSH has developed standardized diagnostic criteria for silicosis and occupational asthma to be used in the SENSOR program. Physicians at UMDNJ-Robert Wood Johnson Medical School provide diagnostic consultation to targeted sentinel physicians, and industrial hygienists at the Department of Health evaluate cases reported to NJDOH to determine the source of exposure and to recommend proper exposure controls.

Comprehensive chemical and dust disease surveillance programs depend on data from a variety of sources, all of which ultimately rely on accurate diagnoses by physicians. The NJDOH has developed active surveillance of silicosis, exposure to heavy metals, and other chemical and dust-related conditions. The SENSOR project should enhance current surveillance in New Jersey by linking diagnosing physicians with medical consultation and public health investigations at NJDOH.

The experience gained from surveillance for silicosis and occupational asthma eventually will be used to set up a comprehensive system to determine how much chemical and dust-related disease occurs in the state and how best to prevent its occurrence. Special efforts will be necessary to make the system sensitive enough to include conditions caused by exposures found in environmental situations that are less intense than the work setting. ■

THE POWER IS ON

Reproductive Toxicity

HOWARD M. KIPEN, MD, MPH
ELISSA ANN FAVATA, MD

Over the past two decades, medical practitioners have been given increasingly persuasive information that alcoholic beverages, cigarette smoke, illicit drugs, and therapeutic agents may increase the risk of adverse reproductive outcome. There also is growing evidence that environmental and occupational exposures adversely impact on reproduction. Birth defects were the initial focus of this latter concern. The first human teratogen, identified epidemiologically only as recently as the 1940s, was rubella virus. This was followed in the early 1960s by the widely publicized limb reduction defects due to thalidomide use in Europe.¹ An equally shocking but somewhat less well-known example of environmental teratogenicity involved severe central nervous system (CNS) abnormalities due to methyl mercury contamination of the fish supply of Minimata Bay, Japan, in the 1950s and 1960s.²

In 1977, concern suddenly was expanded beyond birth defects to include male reproductive toxicity in an occupational setting when over half of the men working with the nematocide 1,2-dibromo-3-chloropropane (DBCP) were found to be oligospermic and azoospermic, some apparently irreversibly.³ This compound has become one of the handful of workplace agents which the Occupational Safety

Health Administration (OSHA) regulates on the basis of its reproductive toxicity; other agents are lead, ethylene oxide, ionizing radiation, and glycol ethers. However, at least 50 commonly used industrial chemicals in widespread use have been shown to produce reproductive impairment in animals.⁴

In the context of these relatively dramatic and high-profile events, as well as others which have not been scientifically established, e.g. human reproductive toxicity of Agent Orange,^{5,6} this essay will put into perspective the mechanisms and clinical realities of occupational and environmental threats to reproductive health in the 1980s.

The scope of reproductive health problems. There is evidence that certain toxic agents commonly found in an occupational or general environmental setting can adversely affect normal sexual function and the ability to produce healthy offspring. However, what remains problematic is that it often is difficult to define the relationship between exposure to chemical toxins and consequent development of reproductive abnormalities. Two major factors contributing to this dilemma are the complexities of the reproductive process and the biological mechanisms underlying toxicology. Methodologic problems in assessing hazard and risk, such as poor characterization of exposure, extrapolation of animal data to humans, the insensitivity of human epidemiologic techniques, and flaws in many epidemiologic and laboratory studies, also contribute to the difficulty

Requests for reprints may be addressed to Dr. Kipen, Department of Environmental and Community Medicine, UMDNJ-Robert Wood Johnson Medical School, Piscataway, NJ 08854.

of evaluation and prevention of exposure-related reproductive abnormalities.^{7,8}

The spectrum of reproductive health problems includes: dysfunction in male and female reproductive organs; increased incidence of spontaneous abortions and stillbirths; and induction of birth defects (Table 1). Dysfunction in reproductive systems can be organic or functional and includes a wide range of abnormalities: infertility; anovulation; amenorrhea; abnormal gonads, ducts and external genitalia; loss of libido; and male impotence. Infertility, the inability of a couple desiring pregnancy to achieve it after one year of unprotected, untimed intercourse, occurs in approximately 10 to 15 percent of the population. Common estimates are that male-mediated factors and female-mediated factors account for about equal proportions, with 10 to 20 percent not having a recognizable physiologic or anatomic lesion. The underlying cause of many of the lesions, such as azoospermia or poorly motile sperm, frequently is obscure.

Spontaneous abortion is the most frequently occurring adverse reproductive outcome with an approximate rate of 10 to 20 percent of recognized pregnancies. This rate of occurrence actually is an underestimation; if a miscarriage occurs in the first four to six weeks of pregnancy, it easily is misdiagnosed as a menstrual irregularity.

TOXICOLOGIC MECHANISMS

Just as reproduction is complex, the mechanisms controlling a toxic response produced by a chemical are similarly complex and involve absorption, dis-

tribution, metabolism, and excretion.⁹ The mechanisms by which reproductive toxins alter underlying biologic processes can be direct or indirect. The direct effect of the chemical may be secondary to structural similarity to an endogenous compound, such as hyperestrogenism in contraceptive formulation workers,¹⁰ or via more generalized chemical reactivity. Examples of the latter may occur after exposure to alkylating agents such as anti-cancer drugs or sterilizing agents in the hospital setting.^{11,12} Toxicity also may result indirectly from an effect that is mediated via a toxic metabolite.

Finally, the expression of chemical toxicity is determined by an integration of the potential toxic effects of chemicals and various mitigating factors, including body defenses. The main factors which modulate the final effect of environmental reproductive toxins include: pharmacokinetic parameters; capacity of germ cells to repair DNA damaged by mutagens; and limitations imposed on the passage of toxic chemicals by biologic barriers such as the placenta and the blood-testis-barrier.¹³

Reproductive toxicity in the male. In males, it is the rapidly dividing and maturing cells of the seminiferous tubules which seem particularly sensitive to environmental agents, although the hypothalamo-pituitary-gonadal endocrine axis presents several targets for environmental chemicals to exert effects on control of spermatogenesis. The effects of chemical exposure on spermatogenesis include production of sperm which are defective in one or a combination of the following characteristics: number, motility, morphology, or genetic material.¹⁴ Sev-

eral spermatotoxic agents have been identified including 1,2-dibromo 3-chloropropane³ and lead.¹⁵ In addition to adverse effects on the dividing spermatogenic cells, the seminiferous tubular epithelium also may be damaged by agents such as cadmium.^{16, 17} Physical agents such as nonionizing radiation, which may raise tissue temperature, and other heat sources, also may result in reduced sperm production.¹⁸ Ionizing radiation may reduce sperm counts, but is of additional concern because of its mutagenic potential.

Reproductive toxicity in the female. Normal ovarian function is essential for female reproduction. Chemicals may adversely affect the developed ovary through a direct effect on oocytes or follicles, disordered follicular growth, abnormal steroid hormone synthesis or action, disrupted hypothalamic-pituitary-ovarian interactions, inhibited oocyte release, or through altered corpus luteal function. The adverse effects include irregular menstrual cycles, infertility, and genetically damaged oocytes, which when fertilized, may result in nonviable embryos.

Genetic aspects of reproductive toxicity. Many chemicals encountered in the environment or workplace are mutagens, that is they can cause inherited changes in the sequence of DNA. This has profound, although relatively undocumented, implications for human reproductive health since the instructions for the growth and development of an entire organism are contained in the haploid genetic material of the two cells, male and female gametes, which will unite to produce it. Investigations in animals suggest that the changes in sperm morphology may reflect genetic damage in the male germ cell. Although embryonic death or the transmission of genetic aberrations to live born progeny are possibilities, the consequences and likelihood of fertilization by sperm affected by chemical exposure during spermatogenesis (or oocytes affected during oogenesis) are unclear.²¹

As shown in Table 1, there is a high percentage of visually abnormal chromosomes in spontaneously aborted fetuses. Perhaps others have morphologically invisible changes such as point mutations or sister chromatid exchanges (SCEs). Many environmental chemicals, such as alkylating agents like ethylene oxide, are potent inducers of such changes. However, the implications of the actual chromosome aberrations or SCEs on reproductive and other aspects of health are not at all understood. At this point, they may serve more as an indication of exposure than as a predictor of disease or dysfunction.²²

Developmental toxicity. Toxic exposures to the developing conceptus may result in spontaneous abortion, stillbirth, birth defect, neonatal disease, or childhood cancer. The specific outcome of a toxic exposure will be subject to multiple variables,

pertaining to dose, exposure route, additive, synergistic, and antagonistic effects, and unquantifiable aspects of susceptibility. However, a well-documented aspect of developmental toxicity is its time dependence, related in critical and predictable ways to the schedule of early human development.

Significant toxic exposures during the preimplantation period almost always are fatal to the developing organism. Lethal damage technically results in a spontaneous abortion, but may go undetected or be presumed to be a menstrual irregularity. During the embryonic period of development (about weeks three to eight), toxic exposures can produce major structural defects such as neural tube abnormalities or cardiac septal defects. Because of the time specificity of the developmental process, the toxic effect of an agent also is very time specific. Phocomelia due to thalidomide ingestion occurred only when the drug was ingested during weeks five to seven of pregnancy. Outside of this two-week period, thalidomide ingestion caused other effects, or none at all.¹ Specific effects depend on the properties of the agent and on which particular part of the organism is forming at the time of exposure. Unfortunately, the critical first eight weeks of gestation often have passed before pregnancy is diagnosed with certainty, and, thus, before occupational or other environmental exposure can be curtailed effectively.

During the fetal period, lethal outcomes from any given exposure are less common, although spontaneous abortions and stillbirths still can occur. A different spectrum of disorders is considered more characteristic of toxic insult during the fetal period. These include low birth weight, functional neurologic disorders,²³ and transplacental carcinogenic effects such as those attributed to diethylstilbestrol (DES).²⁴

In addition, the postnatal period is not free from hazard. Structural and functional maturation continue after birth, particularly in the nervous, immune, endocrine, reproductive, and drug metabolizing systems. The neonate remains susceptible to workplace and environmental insults, especially through exposure to toxins in breast milk or contaminants brought into the house on clothing.

AGENTS TOXIC TO REPRODUCTION

Table 2 presents information on workplace and environmental agents with the potential to cause adverse reproductive effects in humans. It includes a selection of agents based on multiple criteria including human and animal data. It should be apparent that there is no definitive list of reproductive toxins, because of the limitations of methods for studying human toxicity. For instance, effects observed in one sex and not another may be more

reflective of a paucity of data than of differential toxicity. We have included reproductive hazards with effects only observed in animals, e.g. glycol ethers, because in many instances it may never be possible to develop and analyze a well-designed human experiment. Some of the data substantiating risk in humans are not yet verified, but this information is included based on preliminary reports, e.g. formaldehyde. All applications of lists such as this must be carefully based on a good understanding of the actual circumstances of exposure.²⁵⁻²⁶

ENVIRONMENTAL REPRODUCTIVE TOXICITY

Clinical evaluation of environmental reproductive problems will rely on the knowledge and the facilities of primary care physicians, and often will lead to consultation with experts such as urologists, obstetrician-gynecologists, toxicologists, and genetic counselors. It is important for the primary care physician to have a full understanding of the range of tests, procedures, and options available, and of their limitations, in order to provide guidance to patients.

Males. Physicians frequently are consulted when there is a question of an occupational cause of male infertility. The demonstration of an occupational cause for male infertility is fairly straightforward and requires four steps:²⁷ 1) There must be evidence of a gonadal disorder manifested by an abnormal semen analysis. 2) Nonoccupational causes must be excluded. 3) There must be exposure to a known or suspect agent of testicular dysfunction. Toxicology consultation may be especially valuable since there is no definitive list of spermatotoxins, and one may need to deal with areas of structural similarity of

chemicals or mixtures of compounds. 4) Finally, it is helpful to see improvement of semen parameters after removal from exposure. Because of the complete turnover of sperm in a period of three months, this may be a practical diagnostic aid. Nevertheless, some forms of injury such as oligospermia or azoospermia resulting from damage to the germinal epithelium will not demonstrate such recovery, or it may take substantially longer. Increased follicle-stimulating hormone (FSH) and luteinizing hormone (LH) may indicate primary testicular failure, although usually only in cases of severe dysfunction. In the DBCP exposure referred to in the introduction, high LH levels were present as an indicator of testicular failure. Biomonitoring for toxicant level may guide an expected response to removal from exposure, although this has only been documented to be possible in the case of oligospermia due to lead exposure.²⁸ The primary problem at this point seems to be the lack of reliable biomonitors to indicate or quantify exposure to most toxic agents.

In the male, a conventional sperm assay can be used to evaluate the parameters of number (sperm density), morphology on cytologic examination, and motility compared with various standard values. Inferring cause from abnormal findings is difficult unless a specific agent is known to be present in the environment. There is growing evidence that the abnormal shapes correspond to mutagenic exposures.²¹ Low counts have not yet been established to correlate with genetic damage.

Females. There are no tests of female gametogenesis comparable to a semen analysis. There-

Table 1. Frequency of selected reproductive end points.*

Event	Frequency per 100	Unit
Azoospermia	1	Men
Birth weight <2500 g	7	Live births
Failure to conceive after one year of unprotected intercourse	10-15	Couples
Spontaneous abortion 8 to 28 weeks of gestation	10-20	Pregnancies or women
Chromosomal anomaly among spontaneously aborted conceptions 8 to 28 weeks	30-40	Spontaneous abortions
Stillbirths	2-4	Stillbirths and live births
Birth defects	2-3	Live births
Chromosomal anomalies in live births	0.2	Live births
Severe mental retardation	0.4	Children to age 15 years

fore, workup of environmental toxicity often is limited to a consideration of the pregnant state. Nevertheless, the history and physical examination remain very important for the evaluation of the individual patient. History of venereal disease, surgery, alcohol, tobacco, medication, and drug use, and contraceptive history are important. The complete reproductive history should include any history of infertility and a record of all known pregnancies and their outcomes, including birth weight.

Pre- and postnatal toxicity. The area of most evident concern with respect to environmental reproductive toxicology in females occurs after conception has occurred, and goes through lactation and the postnatal period. Consider the following three typical situations:

1. The primary consideration in this setting is whether there is specific enough information about both the toxicology of a particular agent, and about the particular individual's exposure to it, to justify a recommendation to avoid further exposure, at least during pregnancy or conception. The usually limited database available for human embryo- and fetotoxicity should be assessed along with the animal

data, the individual's exposure data, and the possibilities and practicalities of effecting change (such as temporary job transfer). This is an exceptionally difficult area because even the absence of exposure cannot assure a good outcome. Furthermore, even in the face of known toxic exposures, untoward outcomes commonly will not be expected in any given pregnancy. Decisions may be even more problematic when the costs of avoiding exposure are socially or financially high, such as when it means finding a new place of employment for the mother, or finding a new water supply.

2. One may need to advise a pregnant woman who already has had a potentially fetotoxic exposure, perhaps because she presents for counselling near the end of the first trimester. There probably are some situations where one may recommend a therapeutic abortion, such as following heavy exposure to known human teratogens such as high-dose organomercurials or ionizing radiation. More commonly, however, this situation will call for reassurance, even in the face of some degree of risk because, with the exception of high-dose situations involving an agent with known dose-response data (such as radi-

ation or medication), one is not commonly in a situation where an adverse outcome has truly become "likely." Again, this is not to say that the risk is not increased. Especially in such a setting, the decision to terminate a pregnancy must obviously involve careful weighing of the best available data by the parents with full knowledge of the uncertainties. Genetic counselling groups are a good source of assistance in quickly marshalling such data, and are experienced with guiding such decisions when needed by patients and physicians.

3. One may need to advise mothers and fathers of young infants about risks from exposures through breastfeeding or bringing toxic agents into the home environment, e.g. dental technicians whose clothes may be contaminated with mercury. Also, many different chemical agents may be concentrated and/or excreted in breast milk, including PCBs, lead, mercury, and others.²⁹

Availability of exposure information is critical to making an informed decision, and frequently is lacking. In addition to the information provided by the patient, every effort should be made to contact an employer or state or local health department for any information, qualitative lists, or quantitative measurements, which will assist in characterizing the type and degree of exposure to toxic agents, past, present, or future. Your patient frequently may be able to assist you in obtaining such information on exposure.

The pregnant worker. In view of increased work of respiration and oxygen demands, the pregnant worker may be more susceptible to asphyxiant agents, such as carbon monoxide. With an increased respiratory rate and tidal volume, the woman may absorb greater amounts of airborne contaminants than when not pregnant. In addition, the pregnant woman has a hyperemic bronchopulmonary system and again she may be more sensitive to particulate matter and allergens such as flour, epoxy, pollen, and sawdust.

There may be other environmental factors which are particularly stressful for the pregnant worker. Extreme heat and humidity can be environmental or caused by occlusive garments. In addition to her own increased metabolic output, the mother's body dissipates fetal body heat, about one degree higher than hers. Consequently, she may be more sensitive to heat and humidity than she was prior to pregnancy.

Medical care of the pregnant worker. The following recommendations have been made by the American College of Obstetrics and Gynecology and NIOSH:³⁰

The normal woman with an uncomplicated pregnancy and a normal fetus in a job that

presents no greater potential hazards than those encountered in normal daily life in the community may continue to work without interruption until the onset of labor and may resume working several weeks after an uncomplicated delivery.

Recommendations to deal with biomechanical and exertional factors have been summarized by the AMA and are listed in Table 3.³¹ These are consensus guidelines, and not necessarily based on clinical or other data. They should be viewed as suggestions, rather than firm rules.

CONCLUSIONS

Consideration of the environmental aspects of reproductive toxicity is a field whose prominence is increasing more rapidly than its knowledge base, especially with respect to human data on specific compounds. Characteristic of all aspects of en-

vironmental medicine which deal with questions of causation and prevention, the ability to assess and understand the determinants of exposure are the clinician's primary asset in making reasonable recommendations and determinations, for even the most toxic compound carries less risk than an innocuous one, in the absence of exposure. ■

Clusters of Environmental Disease

DANIEL WARTENBERG, PhD

The study of environmental disease is a relatively new area of scientific investigation. As chemical use in the United States has soared in the post-World War II chemical age, so has the public's awareness of unusual patterns of disease and the science designed to study them. Indeed, clusters of environmental disease have become the scourge of the 1980s, becoming frequent news items in our daily tabloids, overwhelming local health department resources with numerous citizen reports and requests for study, and challenging scientists to devise new and more effective methods of identifying, documenting, and remediating the alleged risks. To differentiate these environmentally induced problems from ones due to other causes, scientists attempt to document anomalous disease rates, identify environmental exposures, and show a plausible link between the two. Unfortunately, many problems often interfere before that task is completed.

In August 1978, New York State Commissioner of Health Robert Whalen warned residents of Love Canal of "a great and imminent peril to the health of the general public residing at or near the site."¹

Requests for reprints may be addressed to Dr. Wartenberg, Department of Environmental and Community Medicine, UMDNJ-Robert Wood Johnson Medical School, 675 Hoes Lane, Piscataway, NJ 08854.

Exposure to toxic chemicals was documented, and a health impact was feared. A scandal ensued that resulted in a government buy-out of homes. Subsequent studies reported excess rates of disease, but interpretation of these studies still is controversial.^{2,3} Earlier that year, in Rutherford, residents became concerned about an apparent cluster of 22 cases of childhood leukemia and Hodgkin's disease. The diseases were documented, but a common, causal exposure never was found.^{4,5} In Woburn, Massachusetts, an excessive number of childhood leukemias was noticed by the mother of one of the victims. The problem was confirmed by two studies conducted by government agencies, and academic scientists statistically linked the cluster to a contaminated drinking water supply.⁶ And yet, causation still is debated hotly. In the early 1980s in Santa Clara County, California, an excessive number of birth defects and miscarriages were reported in a region where drinking water had been contaminated by a chemical spill.⁷ Again, although disease excess was documented and putative exposure had occurred, information linking the two was inconclusive.

WHAT IS A CLUSTER?

The scenarios described are clusters. They exist as public health and public relations problems. We try

to understand what each such situation represents, what events might have given rise to this occurrence, and what actions are warranted based on the available information. But, scientifically, what are these things called clusters, why are they so controversial, and why is it so hard to show causation? Quite simply, clusters are aggregations of disease. They may be evidenced by high rates of a common condition, such as spontaneous abortion or miscarriage, a condition which occurs normally in about 15 percent of all pregnancies. More often, clusters are noted as unusually frequent occurrences of rare diseases, such as particular cancers or congenital anomalies.

Clusters are unusual in that the cases of concern are not distributed randomly across all segments of the population, but they are aggregated, or clustered, within one (or more) stratum of the population. For instance, affected residents may live in the same neighborhood, attend the same school, be members of the same family, receive drinking water from the same source, or be workers in the same factory. Problems range from the identification of the population at risk and the statistical evaluation of the case data with respect to the population at risk, to the interpretation of the analysis and communication of the results to the public.

Physicians are in an ideal situation for the early detection of clusters. When they see patients from the same area, social class, and workplace, they have the opportunity to coalesce a large mass of data on disease incidence rates. When anomalous rates are found, they should report these results to public officials and request that the agency undertake further investigation. These results then should be reviewed by the reporting physician as well as by independent experts. Physicians should be receptive to reports of anomalous incidence patterns provided by patients.

Historically, most cluster studies have examined occupational situations. Most often they have focused on the occurrence of some type of cancer.^{8,9} Even so, a number of reports of high rates of environmental disease within particular subpopulations have been noted far back in history. In the 18th century, chimney sweeps were found to have an excess rate of cancer of the scrotum. In the 19th century, John Snow noted that cholera was transmitted through water, and was the causative agent in a cluster of disease in suburban London. But not until the 1960s did the general public begin to appreciate how frequently situations of unusually high disease rates occurred. With that awareness came the suppositions that linked exposures to chemicals at home and in the workplace to adverse health. That was the decade when the evidence for the association between asbestos and lung disease became clear,

when the surgeon general argued that smoking did indeed lead to lung cancer, and when the federal Occupational Safety and Health Administration (OSHA) was created. Environmental awareness and the belief that diseases could occur from exposures to low levels of chemicals over long periods of time became ingrained in the minds of the American public.

With the rising awareness of the ubiquity of cancer-causing agents in our environment, people began paying more attention to disease rates. If they knew of one case of cancer, they began to ask neighbors if they knew of other cases. If there was a particular hazard in a specific neighborhood, they began asking if there were any cases of unusual disease. People had learned of the link between chemicals and disease in some occupational settings and began extrapolating to their own lives. In essence, what had been a surveillance system limited to local physicians was taken over by a concerned public—people wanting to know if there was anything unusual about their neighborhood or their town. Vigilance increased, resulting in increased reporting, and increased reporting created a need for more exact and objective evaluation.

EVALUATING CLUSTERS

To evaluate clusters, investigators have to grapple with a series of problems. Is the alleged cluster a true excess of disease or a statistical artifact? Is the disease related to an environmental exposure or is it due to some other etiology? Are investigators failing to identify many true situations of disease excess? When faced with a report of a disease excess, what should a health official do?

One of the first steps in responding to a report of a cluster is to verify that the observation is unusual statistically. A statistical problem that resulted from the increased vigilance described is the occurrence of false positive (type I errors). That is, the harder you look, the more you find. When vigilance

increased, people began to find many apparent clusters of disease. But only some of what looks unusual statistically, truly is the result of abnormal circumstances.

With disease, one must consider how often we look for unusual rates. If we only look once at one small neighborhood in the entire United States, and we find a rate of cancer much higher than that of the nation overall, that would be reason for concern. The probability of finding such a town in one observation, given the variability of rates, is small. However, with the increased awareness of environmental disease, many residents in many neighborhoods within many communities across the country are looking at disease rates of their families and their neighbors. If we look at each community, and within each community at each neighborhood, occasional excesses are not only expected, but their absence would be unusual. And yet, some of them may be due to unnecessary exposures to toxic materials. We need additional information to be able to verify or discount the problem. In summary, the more often we look for an effect, the more often we will find one, but also the more often the effect will be artifactual, attributable to chance fluctuations.

In addition to increased awareness and reporting, it seems that the clusters of rare diseases, such as leukemia, are identified more often than the clusters of common diseases, such as lung cancer. The reason is we compare rates of incidence of disease in a particular subpopulation to background rates of disease of a "standard" population. In such comparisons, the incidence of a few cases of a rare disease is more unusual statistically than the occurrence of many cases of a common disease. For instance, consider a relatively rare disease, like cancer of the larynx, that accounts for three deaths per 100,000 people in the United States. In a neighborhood of 1,000 people, annually one would not expect to see this as a cause of death at all. If two cases occurred, this would be highly unusual ($P < 0.001$). Based on these data, odds of dying from disease in this community would be 67 times that for the entire United States (an increase of two cases over the expected number of cases). On the other hand, if a disease was the cause of death in 3 out of 1,000 people throughout the country, such as cardiovascular disease, and this occurred in 6 people in this same neighborhood, that would not be unusual (an increase of 3 over expected). The odds of dying from the disease in this community would be two times that for the entire nation, but not statistically significantly different from the entire United States. So, our attention is focused on rare diseases that affect a few people, rather than more common diseases which may affect a large portion

of our community. Two extra cases were more noticeable than three extra cases. In summary, the lower the background rate of incidence of a disease, the fewer cases needed to statistically verify an excess rate, or cluster.

A complementary problem is the detection of false negatives (type II errors). In these situations, data showing a suggestion of clustering are discounted because they are not statistically significant. In part, this may be due to the number of people considered in the subpopulation. As the number of people exposed to toxic material (the population at risk) increases, so the ease of statistically detecting a difference increases (as n increases, the standard error decreases). Consider cardiovascular disease again, with a mortality rate of 0.3 percent (three cases per 1,000 persons) for the United States. For a neighborhood of 100 people, there would have to be a mortality rate of at least 2 percent (two cases per 100 residents) for the neighborhood to be considered statistically unusual. If the neighborhood was defined to contain 1,000 residents, one would need only a mortality rate of at least 0.7 percent (seven cases per 1,000 residents, less than 1 per 100) to find the neighborhood unusual, statistically. The greater the number of people at risk, the smaller the effect that can be detected. Of course, if the study neighborhood is designed to include a large number of people not exposed, or not at risk, this effect will be diluted. In summary, the greater the sample size, the easier it is statistically to detect a specified excess of disease for the entire population, or the smaller change in disease rate that can be detected statistically.

INFERRING CAUSATION

Another problem in the investigation of clusters is inferring causation and the difficulties of relating a particular series of disease events to a particular exposure. Confounding the problem is the variation introduced from person to person and family to family by genetics and environment. Variation of age, socioeconomic status, smoking habits, drinking habits, occupational exposures, and other confounding variables all affect the total risk to which a person is subject. Epidemiologists try to isolate a particular risk factor and then determine if people are more likely to get a particular disease from exposure to that risk factor when the effects of all other risk factors have been removed. Unfortunately, the information on other risk factors is difficult to obtain and the methods of adjustment are complicated.

To verify clusters as regions of high risk rather than as statistical variation, corroborating evidence is necessary. Exposure data is needed. Is there evidence that the "diseased" population had an ex-

posure to a common toxin that is different from the exposure of most other residents? If so, is it possible toxicologically that the exposure caused the disease? Did exposure pre-date detection of the disease, and was there sufficient time to allow for latency, e.g. solid cancer usually takes a minimum of ten years to develop after exposure. Affirmative answers to these questions would suggest a problem. Additionally, disease specificity is checked. In other studies, has the particular disease outcome of concern been linked to a particular toxic agent? Or, have toxicological studies shown a plausible mechanism of action linking the exposure to the disease observed. Does increased exposure in a population correspond to increased rates of disease? Further, we can look at other disease outcomes in the same population. Does the town with a high leukemia rate in children also have a high rate of miscarriages and congenital anomalies? If so, a particular agent may be affecting fetuses and young children.

Finally, in evaluating reports of disease clusters, or their absence, one must consider the source of the report. Residents' reports are likely to be evaluations of crude rates with limited concern for the statistical issues of confounding, bias, and multiple comparisons. My experience with such reports often is that they are reliable within their own context (when people perceive a cluster, there is one, more often than not). But, further analysis to remove confounding variables, or to document exposure, may not identify an ongoing hazard. Lack of adjustment for confounding, inappropriate definition of the population at risk and other technical errors may explain the observation, as well as chance statistical fluctuations. But many clusters also are real and merit prompt attention. When an apparent disease excess is detected, expert analysis should be employed to determine whether there is reason for concern,

further study, or remediation.

Historically, most cases of confirmed clusters have arisen through the investigation of citizen and/or physician-based reports. In New Jersey, a group of physicians (later forming an organization known as Save Our Shores) noted the increased incidence of gastrointestinal problems of a number of their patients. They determined that these individuals had been swimming at the ocean beaches and urged the Health Department to study the problem. One study currently is underway and others are being contemplated. In general, health officials have not developed nor implemented surveillance programs that are as sophisticated as individual case reports reviewed routinely by physicians. Expectations of future computerized systems that routinely census disease registries, DRG, and hospital discharge files abound; until these systems are implemented and tested, we must rely on the astuteness and responsibility of physicians and citizens in the reporting of unusual case findings.

One caveat in seeking expert advice in the investigation of clusters is that public officials have incentives for minimizing the reporting of health risks and failing to identify environmental hazards in a timely fashion. Ozonoff and Boden point out that, for public health officials, consequences for overlooking a true hazard pale in comparison for those erroneously identifying a nonexistent hazard.¹⁰ Commercial, political, media, and public interest groups respond with vigor to officials' reports of clusters, a chain reaction that is difficult to defuse. Failure to identify a hazardous situation, however, does little other than to incite reaction from public interest groups. A tardy apology is the only penalty officials usually have to face. One should seek independent confirmation when concerns about disease clusters are dismissed by public health officials. ■

Death Rates in New Jersey

MICHAEL GREENBERG, PhD

Thirteen years ago, the National Cancer Institute's first atlas of cancer mortality¹ implied to many New Jersey residents that New Jersey is an unhealthy place in which to live. The legacy of hazardous materials left in abandoned dumps, of air pollution, and of radon supports their fears. Now, there is contrary evidence: for the past two generations, New Jersey's youthful white population has had some of the lowest death rates in the United States,² and New Jersey's cancer rates have decreased compared to the United States as a whole.³

As part of a larger, national time-series study of cancer and seven other major causes of death, mortality trends in middle-age, white New Jersey residents were compared to their counterparts in other states. Results show New Jersey is fast closing the mortality gap—that is, its middle-age population has average, not high, death rates.

DATA AND METHODS

The industrialization of the south and the deindustrialization of the north have transformed the American economy, along with the geography of occupational and environmental risk. Medical services have spread across the country, equalizing access to prevention and treatment. During the study period, 1939-1981, the European-born American population decreased, an important change because this population had higher rates of many diseases, including cancer. Most important, the 40-year period begins before the national highway system, airlines, tele-

vision, national magazines, and other mass media devices helped carry big city behavioral risk factors, such as drug use and smoking, to small cities, towns, and rural areas.

The research analyzed trends of eight major causes of death: heart disease, cancer, cerebrovascular diseases, accidents, suicide, homicide, influenza and pneumonia, and other causes. Finer breakdowns are not feasible because of International Classification of Disease (ICD) reclassifications.

The mortality data are all deaths for these eight categories for the periods 1939-1941, 1949-1951, 1959-1961, 1969-1971, and 1979-1981. The deaths are divided by the number of residents—called the population-at-risk. This population was estimated by extrapolating with a linear line between U.S. Bureau of the Census decennial census counts.^{1,3,4} The 1981 population was estimated by extending the 1970-1980 trend.

Young, middle age, and elderly populations have distinct mortality profiles. Trauma from homicide, suicide, and accidents account for about half of deaths among the under 35 population, compared to less than 3 percent of elderly deaths. Cause of death frequently is difficult to establish among the elderly, especially several decades ago, which is another reason for separate analyses of age groups. Another difficulty is that states, counties, and communities may have high death rates of one age group and low death rates of another, which obfuscates results of studies of all age groups. In fact, New Jersey has had among the lowest rates of youthful deaths and the highest rates of elderly deaths.^{2,3} For these reasons, researchers frequently study the middle-age population—35 to 64—as a barometer of changing mortality.

Requests for reprints can be addressed to Dr. Greenberg, Director of the Environmental Policy Division, Environmental and Occupational Health Center, Rutgers University, Livingston College, New Brunswick 08903.

*Ratio of New Jersey and United States rates. †Rank of New Jersey, 1 is highest rate and 48 the lowest.

The nonwhite population is not included because it is too heterogeneous as it includes blacks, Native Americans, Asians, and other subpopulations with markedly different death rates.⁵

To control for age differences between New Jersey and other states, the standard practice of age-adjusting the death rates was used—mathematically controlling for the fact that mortality increases with age. The 1960 population of the United States was used as the population standard. Age-adjusting means that New Jersey's death rates can be compared to rates of other states without age explaining any of the difference.

Two devices are used for displaying the results. Ratios of New Jersey/United States age-adjusted death rates replace actual rates because the ratios make it much easier to spot trends. A ratio of 1.0 means that New Jersey's rate is the same as the nation's; a ratio of 0.80 means that its rate is 20 percent less than the nation's; and a ratio of 1.33 means that New Jersey's rate is one-third higher than the nation's. New Jersey's residents are interested in comparing New Jersey's rates with those of other states. Historical data are available for the 48 contiguous states. New Jersey's rate for each cause of death is ranked 1 to 48; a rank of 1 represents the highest and 48 represents the lowest.

The use of state/national ratios and ranks has the disadvantage of obscuring mortality trends. A death rate could increase from 25 to 50/100,000 and would not be noticed, if the national rate also doubled. Therefore, mortality trends are described briefly.

RESULTS

The death rates for New Jersey's white, middle-age population now are comparable to national rates. New Jersey no longer has among the highest death rates. Numerical rates are presented in the Table, and the Figure compares the ratios in 1939-1941 and 1979-1981.

Heart, Cancer, and Cerebrovascular Diseases. Heart, cancer, and cerebrovascular diseases account for almost three-fourths of the deaths among middle-age New Jersey residents. Death rates from heart diseases have plunged in the 35- to 64-year-old age group. In New Jersey, the male and female rates dropped from over 500/100,000 and 250/100,000, to 316 and 95, respectively. New Jersey's decline was greater than the nation's; the New Jersey/United States ratios have decreased from 1.22 (rank 5) to 1.04 (rank 22) for white males, and from 1.38 (rank 2) to 1.02 (rank 17) for females.

New Jersey's male cancer mortality rate has hovered around 210 for two generations, while the na-

tional rate has increased; and the female rate gradually has decreased from 220 to 178, a greater decrease than the nation's. The result is that the male relative ratio has fallen gradually from 1.31 (rank 2) to 1.00 (rank 26). The female ratio has fallen from 1.13 (rank 7) to 1.09 (rank 7). New Jersey continues to have a relatively high white female cancer mortality rate, albeit the relative ratio has decreased and the age-adjusted rate declined more than 20 percent from 1939 to 1981.

About 4 percent of middle-age deaths are caused by cerebrovascular diseases, e.g. stroke. The death rate has declined to less than one-third of that in 1939-1941. Compared to heart diseases and cancer, cerebrovascular diseases are a major chronic disease that consistently has been characterized by relatively low rates in New Jersey. In 1939-1941, male and female ratios were 1.03 and 1.15 (ranks 15 and 5, respectively); these have declined to 0.94 and 0.91 (ranks 29 and 31, respectively).

Traumatic Causes of Death. Homicide, suicide,

and motor vehicle and other accidents are responsible for 6 percent of deaths in this age group. Homicide rates, especially female, increased during the 40-year study period. Suicide and accident death rates are about half of what they were two generations ago.

New Jersey has had the lowest or among the lowest traumatic death rates of all states for at least a generation. In 1939-1941 and 1949-1951, New Jersey's female suicide rates were higher than the nation's, and the female accident rate was slightly higher in 1939-1941. Now, New Jersey's traumatic death rates are at least 25 percent less than the nation's. This also is true among white youth ages 15 to 24.²

Influenza, Pneumonia, and Other Causes. The death rates for influenza, pneumonia, and other causes in New Jersey and the nation are less than one-third of what they were 40 years ago. Male ratios for the aggregate of all other causes have been low. Female ratios started high, and gradually have de-

Figure. Comparison of age-adjusted death rates; population 35 to 64 in New Jersey and the United States. 1939-1941 and 1979-1981.

creased to the level of male ratios.

All Causes. New Jersey's female death rate was 15 percent higher than the national rate in 1939-1941 and 1949-1951. New York and Pennsylvania had higher female death rates and eight states had higher male rates. Cancer and heart diseases were the reasons. New Jersey's female death rates were 13 and 38 percent higher than national rates, and male death rates were 31 and 22 percent higher. The relative decrease of these two figures (70 percent of deaths) accounts for New Jersey's decline from relatively high to its current average mortality rates.

Regional Context. Connecticut, Massachusetts, New York, and Rhode Island—New Jersey's northern neighbors—have followed the same path from high to average mortality. The south has replaced the northeast as the high mortality region.⁶ The average total mortality rate of West Virginia, Kentucky, Mississippi, and Arkansas has risen to 13 percent higher than the national rate.

DISCUSSION

Northeastern urban states, like New Jersey, no longer have the highest middle-age population mortality rates in the nation. The urban northeast probably had high heart, cancer, and diabetes rates because the northeastern cities were the starting point in America for many negative habits, i.e. smoking and drug abuse. Now, there is an emphasis on healthier lifestyles. The Centers for Disease Control data show that New Jersey is one of the states leading the nation in stopping smoking and using seat belts.^{7,8} About 35 percent of males aged 35 to 54 in New Jersey and Pennsylvania are reported as current smokers compared to about 55 percent of their counterparts in West Virginia and Kentucky, the states with the two highest mortality trends. Also, occupational and outdoor industrial pollution no longer are concentrated in the north. Finally, it takes two generations for a change from foreign to

native morbidity and mortality patterns; now, northeast mortality profiles resemble national patterns and not European profiles.

There are three explanations for New Jersey's consistently low traumatic death rates:² New Jersey's economy is oriented to services and final stage manufacturing; hence, fewer workers are exposed to the boom and bust stresses of the western extractive economies and the injuries associated with mining, agriculture, and primary manufacturing. Second, New Jersey's families are typically more stable and oriented to religion than their western counterparts—both of which seem to be protective against violence. Third, our monotonous straight roads and short driving trips apparently reduce the probability of fatal road accidents.

The typically healthier lifestyles of the northeast's middle-age population are reinforced by state government policies. New Jersey is one of the most progressive states: George Washington University's study of state cancer protection programs found that New Jersey and its neighbors, Connecticut, Massachusetts, and New York, averaged seven of the nine possible programs; West Virginia, Kentucky, Arkansas, and Mississippi averaged 2.5.⁹ The Conservation Foundation ranked environmental programs in the 50 states;¹⁰ the average rank of the 4 northern states was 7 (very strong); the rank of the four southern states was 30 (weak). In addition, New Jersey has taken a strong posture against drunken driving, speeding, drug abuse, and handgun use.

CONCLUSION

New Jersey is healthier than is commonly believed; yet we should not relax about protecting public health and the environment. If New Jersey is to remain a leader in this field, we must invest in government, industry, research, and educational programs that have helped overturn a legacy of sweatshops, smokestacks, pollution, and poor health. ■

Risk Communication

AUDREY R. GOTSCH, DPH
RICKIE G. KASHDAN, MEd

The following patient scenarios are risk communication problems. In each case, the patient has concerns or fears that need to be addressed, has inaccurate or incomplete information about a particular health risk, and has an understanding or perception of the risk that is different from that of an expert opinion.

- A 40 year-old teacher finds out that for the last seven years he has been teaching in a room with asbestos tiles in the ceiling. He says the asbestos tiles have been flaking off and he wants to know about his risk of lung cancer or asbestosis.

- A woman from northern New Jersey mentions that one of her neighbors recently tested her home for radon and the level was below the "safe level" set by the Environmental Protection Agency (EPA). She says she thinks all this stuff about radon is a big hoax, and wants to know if her physician thinks she should have her home tested.

- A 28 year-old woman has had three miscarriages in the last two years. She hears about the superfund toxic dump site a mile from her home and wants to know if her miscarriages could be the result of drinking contaminated well water.

- A radiator repairman says his wife has been complaining that he seems tired and moody. He says he has been having trouble sleeping and has had difficulty concentrating on the job. He also admits to having little interest in sex. An initial blood work-up is negative; however, more indepth testing reveals an elevated blood lead level of 40 mcg/dl. Could the elevated blood level be causing his symptoms? Could it be job-related?

Patients are becoming increasingly aware of environmental and occupational health hazards. Unfortunately, much of the information available to the public on these hazards is difficult to understand, inconclusive, contradictory, and/or unreliable. In order for individuals to select a protective action, they must be fully informed. Because physicians are perceived to be credible sources of information,¹ they have an important role in this vital process of informing patients about environmental and occupational health risks.

Physicians in New Jersey have the opportunity to be effective risk communicators by addressing the concerns of patients, providing accurate and understandable information about the possible consequences of the health risks, and motivating patients to use available resources and take appropriate action.

RISK ASSESSMENT: EXPERT PERSPECTIVE

Risk assessments utilize clinical studies, epidemiologic research, animal studies, toxicology research, and pharmacokinetic data to answer questions about potential risks, such as: Is a toxic dump site hazardous to the surrounding community? What are the least risky techniques for cleaning up a stream contaminated with PCBs? What is an acceptable minimum level of radon in homes? Is the spraying of pesticides to control gypsy moths a health threat to humans? Is a site contaminated with dioxin hazardous to the surrounding community? If so, what are the best methods of remediation? After a cleanup, what level of PCBs can be left in the soil without public health and the surrounding environment being compromised?

Risk assessment is a step-wise process used to evaluate the probability and magnitude of harm to public health, as well as the environment. While

Table 1. Public perspectives on risk.^{6,7,9}

Situation Perceived as Less Risky

- Voluntary
- Risk(s) known/familiar
- Controlled by self
- Fair
- Not immoral
- Not memorable/not dramatic
- Common hazard/not dreaded
- Consequences easily reduced
- Consequences reversible
- Not fatal

Reactor accidents—Rasmussen*	0.02
Radiation from nuclear industry*	0.02

*These items assume that all U.S. power is nuclear. UCS is Union of Concerned Scientists, the most prominent group of nuclear critics.

†Adapted from Reference 14.

there are several different risk assessment models,^{2,3} they generally include the following steps:

Step 1: Hazard identification involves the identification of the intrinsic hazard of the substance or substances to be evaluated. In addition, health effects related to exposure from the specified hazards are identified for evaluation, e.g. organ toxicity, cancer, reproductive effects, death.

Step 2: Dose response determination identifies the numerical relationship between the hazard and the adverse health effects and environmental impacts associated with exposure to the identified hazard(s).

Step 3: Exposure assessment is an evaluation of the extent of human exposure. This assessment includes route, dose, frequency, duration, and time of exposure. In addition, relevant characteristics of the at-risk population are evaluated, such as the number of people likely to be exposed, proximity of the population to the hazard(s), and potential for increased risk of adverse effects due to factors such as advanced age or pregnancy.

Step 4: Overall risk characterization is the con-

clusion based on the hazard identification, dose-response determination, and exposure assessment steps. This summary usually is a quantitative statement of the likelihood of disease or injury and the magnitude or severity of the health effects resulting from exposure. Information obtained from the risk assessment process can be used to eliminate or control known or suspected health risks, to prevent future potential exposures, or to take other actions to protect the public health.

The risk assessment process is limited by a number of factors including: lack of human and animal toxicology data, limited exposure data, necessary extrapolations from animals to humans, and the use of various mathematical models to extrapolate from high to low dose exposures. Because of the uncertainties involved in the risk assessment process, the overall risk determination often is given as a range.^{2,4} For example, the EPA estimates that between 5,000 and 20,000 lung cancer deaths per year in the United States result from indoor radon levels.⁵ At other times, the conservatism built into the risk assessment process by our prudent regulatory approach, particularly for cancer-causing agents, leads to the provision of a plausible upper bound as a single risk number. When discussing health risks, it is important for risk communicators to recognize the limitations and uncertainties involved in the risk assessment process, and to make these limitations known.

RISK PERCEPTION: PUBLIC PERSPECTIVE

Expert evaluations of the magnitude of a health risk tend to be based primarily on annual mortality or morbidity rates. The public, however, has a more comprehensive view of what a risk entails, focusing less attention on statistics. In their evaluation of riskiness, lay people include a number of factors usually omitted from expert assessments of risk: Are the risks known? Does the risk appear uncontrollable? Is there a potential for global catastrophe? Effective communication about environmental health risks begins with the recognition that while the expert perspective on risk often is different from the public perspective, both points of view are legitimate.^{6,7}

When experts evaluate risk, their responses are related directly to statistical estimates of annual morbidity and mortality rates. Research shows that lay people can estimate annual mortality rates that somewhat are related to the statistical estimates. However, the public's overall evaluation of "riskiness" is determined not only by annual mortality rates or accident probabilities, but also by a variety of other characteristics. As a result, public estimates of risk often are quite different from their own (and

experts) assessment of annual mortality rates.^{6,8} Table 1 lists some of the major characteristics that have been identified as important in the public's definition of risk.^{6,7,9}

People tend to be less concerned about health risks that primarily fall into the "less risky" category and more concerned about health risks that primarily fall into the "more risky" category. For example, household use and disposal of pesticides fall largely into the "less risky category." Household pesticide use is voluntary, familiar, and not dreaded. However, the spraying of a large area with a pesticide or having a toxic dump site in close proximity are of great public concern. Both fall largely into the "more risky category" and are seen as involuntary, controlled by others, and dreaded. Conversely, expert perceptions of risk do not take into account the risk characteristics or factors in Table 1. As a result, there often is misunderstanding and miscommunication between experts and the public.

EFFECTIVE RISK COMMUNICATION

Effective risk communication is a two-way process between the patient and the physician, and involves addressing patient concerns, providing information,^{6,8} and motivating patients to use available resources and take appropriate actions.

Addressing patient concerns. An essential step in risk communication is to recognize that patient feelings are valid. Acknowledgement of the feelings (fear, anger, frustration, and sadness) is an important first step; supporting the patient's concerns when warranted, and providing reassurances otherwise. Statements such as, "You must be very frustrated," or "I understand that you are frightened," can be useful. Find out what the patient cares about and attempt to address those concerns first.^{7,10-12} For example, a patient who wants to know whether or

not to test his home for radon, wants a yes or no answer, not a complex answer explaining the potential risk of lung cancer. It is important to separate the factual issues from the patient's feelings. Until the feelings are addressed, the patient will not be able to pay attention to the facts.

Making complex information understandable.

In risk communication, a major difficulty is presenting information clearly and accurately. Information concerning environmental and occupational health risks often is complex and contains probability statements and uncertainties, which are difficult to explain. There is general agreement that it is not very helpful to warn a patient that he or she has between 10^{-7} and 10^{-8} chance of developing lung cancer from an environmental hazard. Some people

Table 4. Annual fatality rates per 100,000 persons at risk.*

Risk	Rate
Motorcycling	2000
All ages	1000
Aerial acrobatics (planes)	500
Smoking (all causes)	300
Sport parachuting	200
Smoking (cancer)	120
Fire fighting	80

4 Tbs peanut butter/day (aflatoxin)	0.8
Floods	0.06
Lightning	0.05
Meteorite	0.000006

*From Reference 8, adapted from Reference 15.

Table 5. Risks which increase chance of death by 0.000001 (1 chance in 1 million).*

Risk	Cause of Death
Smoking 1.4 cigarettes	Cancer, heart disease
Drinking 1/2 liter of wine	Cirrhosis of the liver
Spending 1 hour in a coal mine	Black lung disease
Living 2 days in New York or Boston	Air pollution
Travelling 10 miles by bicycle	Accident
Travelling 300 miles by car	Accident
Flying 1000 miles by jet	Accident
Flying 6000 miles by jet	Cancer caused by cosmic radiation
Living 2 months in Denver on vacation from New York	Cancer caused by cosmic radiation
Living 2 months in average stone or brick building	Cancer caused by natural radioactivity (radon)
One chest x-ray taken in a good hospital	Cancer caused by radiation
Living 2 months with a cigarette smoker	Cancer, heart disease
Eating 40 tablespoons of peanut butter	Liver cancer caused by aflatoxin B
Eating 100 charcoal broiled steaks	Cancer from benzopyrene
Risk of accident by living within 5 miles of a nuclear reactor for 50 years	Cancer caused by radiation

*Adapted from Reference 16.

have attempted to explain the meaning of such low probabilities by using analogies such as the likelihood of being hit by lightning and of being struck by a meteorite at the same time. While such explanations may appear to be useful at first, research indicates that explanations of this sort actually can make the problem seem even worse by making it easier to visualize.⁸ Psychological research indicates that information is not very successful in changing people's beliefs when the beliefs are strongly held. Once the individual has developed an opinion, all new information is seen either as supporting that opinion or conflicting with that opinion. Conflicting evidence often is considered to be factually incorrect or unreliable.⁸ In contrast, people lacking strong prior opinions are easily influenced and manipulated by seemingly insignificant factors, such as how the information is presented. For example, an occupational hazard that would double the risk of getting cancer on the job sounds much more serious than an occupational hazard increasing the risk from one in a million to two in a million. In reality, there is not a completely neutral way to present risk information. In fact, the very act of discussing a particular environmental hazard can increase the public's perception of its riskiness.^{4,7,9}

Another problem in communicating about risk is that the public and the media have a tendency to see environmental risk as a dichotomy: Is it risky? Is it safe?⁷ Unfortunately, there is no risk dichotomy. The more appropriate question is, How safe is it?

Recommendations for making complex risk information understandable include:

- Pay attention to how much the patient already knows and relate any new information back to what already is known.
- Use simple, nontechnical language.

- Pictures, graphs, and charts are useful in explaining concepts of risk and probability.

- To explain how dangerous something is, ask the patient to give an example of something they think is extremely dangerous and would never do. Then ask for an example of something they know is a little risky, but they do it all the time anyway. Explain the original danger in relation to what the patient has told you.¹³

- Use risk comparisons to put risks into perspective. (Tables 2 to 5).

PHYSICIAN RESOURCES

Within this special issue, a number of resources at the New Jersey State Department of Environmental Protection and the New Jersey State Department of Health are described. Access to these studies and educational materials can provide critical background information regarding specific health hazards in New Jersey.

Another important resource in this state is the Environmental and Occupational Health Sciences Institute described by Dr. Goldstein in his articles in this issue. One of the six divisions of the Institute, the Public Education and Risk Communication Division, has developed a variety of educational materials that would be suited for patients on such topics as radon, asbestos, reproductive hazards, and children's art supplies. In addition, a wide-range of continuing education courses are offered through this Division that would be of interest to physicians seeking the most recent data regarding environmental and occupational topics. Through *NEW JERSEY MEDICINE*, physicians will continue to be updated regarding future environmental and occupational health initiatives that may impact on the practice of medicine in New Jersey. ■

When asked by patients about exposure to toxic chemicals in the environment or on the job, to whom can a physician turn? The New Jersey State Department of Environmental Protection (NJDEP) and the New Jersey State Department of Health (NJDOH) actively are developing information and expertise doctors can use to evaluate exposure and answer their patients' concerns. In addition, the Environmental and Occupational Health Sciences Institute at Robert Wood Johnson Medical School is helping to develop this information base.

New Jersey health care professionals are on the frontline in their need to understand the prevalence of toxic chemicals in our environment and the effects of these substances on human health. Accurate and timely information on exposure and on health effects are crucial. New Jersey often is cited as the first-ranked state in potential for exposure to hazardous

substances because it has the nation's oldest and most concentrated chemical industry, coupled with the national lead in population density. Moreover, the close proximity of industrial activities to dense population centers has increased the awareness of New Jersey citizens to environmental health issues. These factors have led to the enactment of strict state environmental legislation as well as to the increased concern of citizens about how environmental hazards relate to them on a personal level. Citizen participation in environmental decision making has become a jealously guarded prerogative in New Jersey, and rightly so, as pointed out by Justice David Bazelon of the United States 11th circuit court.¹

Extensive research is needed to provide information to the public and for understanding that will impact regulatory actions as well as personal care provided by health care professionals.

To begin answering questions about human health effects, NJDEP and NJDOH have undertaken a unique cooperative approach in order to promote better coordination between the agencies that, in turn, will lead to improved protection of public

NJDOH	Workplace Right To Know	Enforces workplace provisions in public agencies; development and distribution of fact sheets on over 2,000 chemicals	(609) 984-2202
NJDOH	Smoking	Implements state program on smoking in public and private buildings and businesses	(609) 588-7494
NJDOH	Chronic Illness Prevention Program	General information or referrals to other programs regarding specific chronic illnesses	(609) 588-7503
NJDOH	AIDS	General information and educational material on AIDS prevention	(609) 292-1008
NJDOH	Immunization	General information on immunization programs for children	(609) 588-7512
NJDOH	Communicable Disease Program	General information and investigations on communicable diseases and prevention	(609) 588-7500

health statewide. Part of this approach involves research to develop innovative tools and methods with which to correlate the various information and data bases managed by, or available to, these two agencies. This research will create a better understanding of the impact of human exposure to toxic pollution and also will generate a framework for resolution of potential environmental health problems.

The cooperative approach between NJDOH and NJDEP is part of the overall New Jersey Environmental Health Assessment Program (EHAP), an initiative announced by Governor Kean in 1986.²

The NJDEP component is housed within the Division of Science and Research; the NJDOH component is managed through its Division of Occupational and Environmental Health. Both programs have individual, longstanding histories of investigating the links between toxic environmental pollution and human health effects. The NJDEP Division of Science and Research began tracking the occurrence and fate of toxic substances in New Jersey's air, groundwater, drinking water, and aquatic resources more than a decade ago, and was instrumental in identifying many of the abandoned waste sites now

on the National Priority List under Superfund.^{3,5} The NJDOH Division of Environmental and Occupational Health has investigated environmental and workplace health concerns through monitoring of health indicators, occupational health risk assessments, community health screening, epidemiologic investigations, and health education. Unifying the resources and expertise of the NJDEP and NJDOH programs through the Environmental Health Assessment program promises to be the catalyst New Jersey needs to better protect its environmental resources and the health of its citizens.

SOURCES OF INFORMATION

The common bond necessary for both NJDEP and NJDOH to understand and manage environmental and public health problems is quality scientific monitoring and surveillance data.

Within NJDEP, environmental data, such as ambient air and water monitoring values, are collected for a variety of purposes: enforcement of environmental laws and regulations; compliance with environmental permits; response to emergencies or spills; and performance of research investigations. Examples of NJDEP's major sources of data are summarized in the Table.

Managed by the Division of Science and Research, the NJDEP Information Resource Center serves scientists and policymakers of both departments, as well as outside professionals upon request, through computer search services from a variety of data bases including: DIALOG, MEDLARS (Medical Literature and Retrieval System), and OCLC (Online Computer Library Center).

DIALOG contains over 280 files which can be

searched through a variety of indexes using different search strategies. Although the files span all disciplines, those most often used are found in the categories of the environment, energy, medicine, biosciences, science, and technology. A search can be run simultaneously in a number of files, maximizing the system's capability while minimizing time spent in the system. Search results may be provided as data displays, or in bibliographic formats including abstracts.

The files TOXLINE, MEDLINE, and HSDB (Hazardous Substance Data Bank) are all held in the MEDLARS data base. Of these, the HSDB is used most frequently within NJDEP. HSDB is a data bank that contains toxicological information along with information pertaining to the environment, emergency situations, safety and handling, and regulatory concerns. HSDB searches done by the Information Resource Center are chemical specific and location is made through CAS (Chemical Abstract Service) number of compound name. A chemical reference file is maintained by the Information Resource Center to provide pertinent information, such as results of HSDB searches and safety data sheets.

The Division of Science and Research's Information Research Center is a member of OCLC, a national cooperative of libraries that created and maintains a data base of catalogued records. Records in the OCLC file can be searched through an alphabetic code based on author or title, or by a numerical code that is unique for each work. OCLC is used by the Information Resource Center both for cataloging and for determining interlibrary loan suppliers.

Another data base available through the NJDEP Office of Science and Research is IRIS (Integrated Risk Information System) developed by Dr. Peter Preuss and his colleagues at the United States Environmental Protection Agency (USEPA) Office of Research and Development. IRIS is a computerized catalog of chemical specific EPA risk assessment and risk management information that provides the latest information on EPA health assessments and regulatory decisions for a limited number of chemicals. IRIS files particularly are useful in that they include rationales for regulatory activities.

A unique collection maintained by the Information Resource Center, and often used within the DEP and by members of the public is the Division of Science and Research publication file. Reports, papers, and other publications authored by the staff of OSR are housed separately and indexed by subject and title. In the future, OSR intends to expand this collection to include publications by all divisions of NJDEP, and relevant NJDOH papers. ■

LOCATION MAP

SHERATON MEADOWLANDS HOTEL

Sheraton Plaza Drive—Two Meadowlands Plaza—East Rutherford, NJ 07073

Tel: (201) 896-0500

How to get to the Sheraton Meadowlands

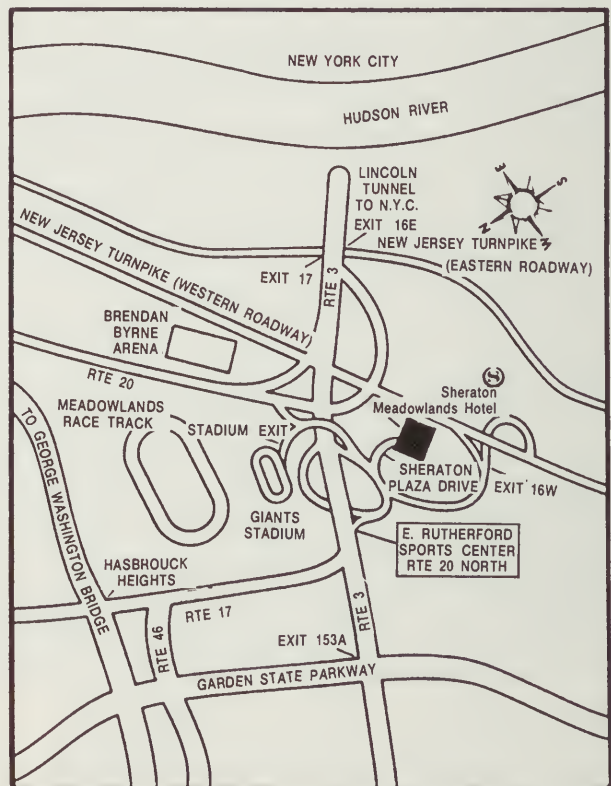

From New York via Lincoln Tunnel: Route 3 W to Sheraton Plaza Drive exit; follow signs to hotel.

From New Jersey Turnpike (N or S): Exit 16 W; follow signs to Route 3 E; stay on service road and follow signs for Sheraton Plaza Drive.

From New York via G. W. Bridge: Take I-95 (N.J. Turnpike) S; exit 16 W and follow as above.

From Garden State Parkway (N or S): Exit 153A to Route 3 E to Route 20 N (Arena) exit; follow signs for Sheraton Plaza Drive.

From Route 17 (N or S): Exit Route 3 E and follow as above.

223rd ANNUAL MEETING

MEDICAL SOCIETY OF NEW JERSEY

Thursday, April 27, to Sunday, April 30, 1989

_____ Single _____ Double Other _____

Please print or type the following information:

NAME _____

ADDRESS _____

CITY _____

STATE _____ ZIP _____

TELEPHONE NUMBER (_____) _____

ARRIVAL DATE _____ DAY _____

DEPARTURE DATE _____ DAY _____

NAME OF SHARING GUEST _____

CHECK IF OFFICIAL DELEGATE ☐ COUNTY: _____

**\$95/Single
\$95/Double
6% NJ State
Sales Tax**

CHECK-IN: 3 p.m.

CHECK-OUT: 1 p.m.

All reservations will be held until 4 P.M. unless guaranteed with a credit card number or first night's deposit.

Card # _____ Type _____ Exp. Date _____

Sheraton Club International Member Number _____

VISA, MASTERCARD, CARTE BLANCHE, AMERICAN EXPRESS, DINERS CLUB & EN ROUTE
CREDIT CARDS ARE ACCEPTED.

MAIL THIS APPLICATION TO:

Reservations

Sheraton Meadowlands Hotel

Sheraton Plaza Drive, Two Meadowlands Plaza

East Rutherford, NJ 07073

Tel: (201) 896-0500

Reservations must be received by April 5, 1989. Those received after cutoff date will be accepted on a space available basis only.

DOCTORS' NOTEBOOK

Trustees' Minutes; UMDNJ Notes; AMNJ Report; New Members; Physicians Seeking Location in New Jersey

Trustees' Minutes September 18, 1988

A regular meeting of the Board of Trustees was held on Sunday, September 18, 1988, at the Executive Offices in Lawrenceville. Detailed minutes of the meeting are on file with the secretary of your county society. A summary of significant actions follows:

George L. Triebenbacher, M.D. . . . Observed a moment of silence in tribute to the memory of Dr. Triebenbacher and adopted the following memorial resolution:

Whereas, the Almighty has called to His presence, our beloved colleague, George L. Triebenbacher, M.D.; and

Whereas, as a trustee, delegate, and member of the Medical Society of New Jersey, Doctor Triebenbacher served the Medical Society of New Jersey and the people of New Jersey; and

Whereas, he consistently demonstrated the attributes of good citizenship, community service, a dedicated, thoughtful and caring physician, and a loving husband and father; now therefore be it

Resolved, that the Medical Society of New Jersey expresses its profound grief and sorrow at the death of Doctor Triebenbacher and extends its sympathy to his beloved family; and be it further

Resolved, that this resolution be spread upon the minutes of this meeting and a copy presented to his bereaved family in heartfelt sympathy.

Report of the President . . .

1. MSNJ Special Assessment . . .

Voted to have the Executive Committee meet with Mr. Maressa to investigate an alternative means that might be offered through which those members who object to paying the special assessment can satisfy their obligation. Also, voted to continue sending letters to members who have not paid the special assessment.

2. NJ State Nurses Association Representation at Board Meetings . . .

Agreed to extend an invitation to the president and executive director of the New Jersey State Nurses Association to attend monthly board meetings.

Audit Review Committee . . . Will review the report of Ernst & Whinney, MSNJ auditors.

Report of Executive Director . . .

(1) MSNJ Paid Membership . . . Noted there were 7,418 paid members as of August 31, 1988.

(2) AMA 1988 Membership . . . Noted that for the Society there were over 9,000 dues-paying AMA members.

(3) MSNJ Financial Statements . . . Approved the financial statements for the periods ending May, June, July, and August 1988.

(4) License Reform Legislation Update . . . Noted that Mr. Maressa will meet with Judge Herbert J. Stern, representing MSNJ in the matter of the SCI report, to review draft legislation and the legislative format.

(5) Malpractice Reinsurance Association Surcharge . . . Approved the recommendation that Judge Herbert J. Stern be retained as MSNJ's external counsel in the federal court suit.

(6) MSNJ 1989 Membership Directory . . . Noted that the following changes will appear in the printed format for the 1989 *Directory*: retired physicians will be listed by name and address only and only members of MSNJ will be listed by name and specialty in the hospital section.

(7) Boyd versus St. Joseph's Hospital . . . Voted unanimously to reaffirm its previous position, and declined to enter the case amicus.

firm its previous position, and declined to enter the case amicus.

(8) Amicus Request in Appellate Division Appeal . . . Declined to enter this case amicus (an appeal in a malpractice case, in which the issue is specialty designation).

(9) Consultants to the State Board of Medical Examiners . . . Agreed to continue the policy of providing the State Board with a list of physician consultants for peer review.

(10) State Board of Physical Therapy Preproposed New Rule . . . Concurred with Mr. Maressa's suggestion that MSNJ not appear at a hearing on the preproposed new rule on October 6; at such time as a proposed regulation is put forth, MSNJ then would take action and oppose the regulation through a requesting hearing process.

(11) Computerized Severity Index . . . Noted that Robert J. Weierman, M.D., chairman of the Committee on Utilization Review Systems, will inform the Board of developments of the computerized severity index by the Department of Health in answer to physician complaints that the DRG program does not account for the severity of a patient's illness.

UMDNJ Report . . . Received a report from Dr. Stanley S. Bergen, Jr., with comments on the following: the higher education bond issue on the November ballot will provide monies to upgrade the higher education system in the state; resident work hours and supervision in New York State are being monitored; and Dr. Frank J. Malta, chairman of the State Board of Medical Examiners, will restudy the Board ruling that deals with students writing on patient hospital charts.

Pennsylvania Blue Shield . . . Noted that Patrick M. Kiley, director of Medicare, Part B, New Jersey, will direct the New Jersey operation, and he or his designee will attend MSNJ Board meetings. Also, noted that information packets, training sessions, booklets listing codes and terminology, education billing materials, and a toll-free telephone number are being compiled for New Jersey physicians.

AMA Annual Meeting . . . Noted the following from the AMA Annual Meeting:

1. Doctors Karl T. Franzoni and

Joseph A. Riggs, respectively, were appointed chairman and vice-chairman of the AMA delegation.

2. Dr. Robert J. Weierman was elected to the position of member-at-large of the governing council, AMA Hospital Medical Staff Section.

3. Dr. Henry J. Mineur was unsuccessful in his bid for the position on the AMA Council on Constitution and Bylaws.

4. Dr. Palma Formica was elected chairperson of the AMA Council on Long-Range Planning and Development.

5. There is a new internal operating handbook from the AMA delegation.

6. The following resolutions were introduced by New Jersey:

a. Location of Leadership Conferences: Report AAA of the Board of Trustees was adopted stating that an evaluation of the location of the leadership conference will be conducted after a conference held in Chicago in 1989 and conferences held in favorable climates in the east and west in 1990 and 1991.

b. Medicare Reimbursement Categories for Social Admissions and Continued Hospital Stays... Resolution was referred back to the Board of Trustees for report back to the House of Delegates at the 1988 Interim Meeting.

c. Repeal of PRO... Did not adopt this resolution calling for the AMA to actively seek repeal of the federal PRO law.

d. Freedom of Choice for Residency Program Directors... A resolution concerning the selection of candidates for residency programs was not adopted.

e. Medicare Deductibles and Copayments... The following amended resolution was adopted: "Resolved, that the AMA request the federal government to inform the public that physicians accepting Medicare assignment are required to make a reasonable attempt to bill and collect deductible and copayment amounts."

f. Equality of Testing... The resolution requesting the National Board of Medical Examiners and the Educational Commission for Foreign Medical Graduates to administer a single test was not adopted.

g. Graduates of Non-United States Medical Schools... The following substitute resolution was adopted: "Resolved, that the American Medi-

cal Association continue to support the policy that all physicians and medical students be evaluated for purposes of entry into graduate medical education programs, licensure, and hospital medical staff privileges on the basis of their individual qualifications, skills, and character.

Committee on Membership Services... Noted that MSNJ has withdrawn endorsement of the Medical Payment Systems, a telecommunications system that electronically files insurance claims.

Committee on Utilization Review Systems... Adopted as amended the following resolution and directed that it be referred to the American Medical Association:

Whereas, various organizations have published reports regarding morbidity and mortality rates of hospitals; and

Whereas, none of the studies were conducted with scientifically accurate or meaningful parameters; and

Whereas, the reports which have been released are misleading and subject to wild speculation; now therefore be it

Resolved, that the Medical Society of New Jersey request the AMA to memorialize the executive and legislative branches of the United States government to refrain

from publishing morbidity and mortality data related to hospitals or physicians unless the information released has resulted from a study that had both meaningful and logically defined parameters and was based upon clinical information that was consistent and verifiable regarding severity of illness issues.

Senior Citizens Task Force...

(1) **State Legislation...** Referred the following recommendation, concerning legislation that would appropriate a grant of \$82,700 to the Central Jersey Health Planning Council, Inc. for the operation of a one-year statewide Medicare toll-free information service, to the Council on Legislation:

That the Medical Society of New Jersey withhold support for A-2597 and S-2458.

(2) Pennsylvania Blue Shield...

Noted that the carrier already has agreed to provide 800 numbers for New Jersey physicians and beneficiaries.

New Business...

(1) **Memo from Abdol H. Islami, M.D., President, Essex County Medical Society...** Referred to the Council on Membership Services and the Committee on Long-Range Planning and Development, a letter from Dr. Islami concerning loss of insurance coverage by New Jersey

CANDIDATES FOR MSNJ OFFICES

If you are interested in becoming an Officer, Trustee, or member of the AMA Delegation, a new opportunity exists for you.

The Nominating Committee will meet several times this year to consider candidates. We will consider members other than those recommended by county medical societies and nominating delegates for any of these offices.

If you wish to be considered, please contact your county medical society or the Medical Society of New Jersey for the necessary forms.

This is a real opportunity for grassroots candidate development and we urge you to use it.

physicians who have had their licenses revoked or suspended.

(2) Vacancies—George L. Triebenbacher, M.D. . . . Noted that the President appointed a screening committee (Drs. Hirsch, Carnes, and Costabile) to solicit nominees to fill vacancies due to the untimely death of Dr. Triebenbacher.

Correspondence . . .

(1) From C. Ross Anthony, Ph.D., associate administrator for program development, Department of Health and Human Services . . . Noted the following response concerning notification of state medical societies six months in advance of anticipated revenue-saving reimbursement changes:

"This is simply not always possible. For example, the Omnibus Budget Reconciliation Act (OBRA) of 1987 included many significant changes in physician reimbursement under Medicare. OBRA was passed on December 21, 1987 and signed into law by the president the next day. Some of the provisions were effective upon enactment, some on January 1, 1988, and although most were effective on April 1, 1988, this was only three months after enactment. Such short time periods make it nearly impossible in some cases to study the legislation and issue instructions to implement the new law in a timely fashion.

As to the request that all physicians be notified three months in advance of any regulatory changes in reimbursement policies, "Medicare law (section 1871 of the Social Security Act) requires that, in general, before issuing a regulation in final form the Secretary of Health and Human Services shall publish the proposed regulation in the *Federal Register* and allow at least 60 days for comment. When the final regulation is published, there usually is a delayed effective date of 30 days. These time periods can be shortened only if authorized by Congress or under very unusual circumstances." Thus, the normal regulations process usually takes at least the three-month period you are requesting.

We sympathize with the difficulty of the physician community in keeping up with the continuing changes in the Medicare program. HCFA and its agents, the Medicare carriers, make every effort to keep physicians abreast of these changes. The complexity and unpredictability of statutory changes do not always allow us to give as much advance notice as we would like.

(2) From James A. Ware, assistant commissioner, New Jersey State Department of Health . . . Noted this response to the suggestion that practicing physicians treating pa-

tients covered under disability, worker's compensation, etc., who receive requests for medical reports, be entitled to reasonable compensation for these additional requests:

The Division of Unemployment and Disability Insurance, and the Division of Workers' Compensation are required by statute to base their benefit determinations on firm medical evidence of disability. These determinations are based upon reports by physicians under whose medical care the individual has been placed. While the statute requires that the claimant submit such medical evidence, it does not have any provisions which relate to the payment of physicians for their services or for their providing reports to the various state agencies.

UMDNJ Notes

Stanley S. Bergen, Jr., M.D., President

The first clinical study of radiation therapy aimed at suppressing the immune system of multiple sclerosis sufferers has shown promising early results at UMDNJ-New Jersey Medical School.

In a controlled study, the research team found the use of total lymphoid irradiation (TLI) will suppress a patient's immune system, allowing for the stabilization of the disease for up to four years.

The study, still in formative stages, is being carried out by a team of neurologists and radiologists led by Dr. Stuart Cook. Dr. Cook, acting dean of our Newark-based school, chairs its Department of Neurosciences.

In a report on the project published in the July supplement of *Neurology*, Dr. Cook and his colleagues reported that there were few serious complications during or after the radiation treatments.

In the study, the investigators treated 27 multiple sclerosis (MS) victims with TLI, while exposing 21 other MS patients to placebo irradiation.

Almost two-thirds of the patients receiving TLI stabilized after therapy and their disease has not worsened during the subsequent four years. In contrast, half the placebo-treated patients worsened within six months of the therapy, 75 percent worsened within 18 months, and 90 percent worsened in 30 months.

Dr. Cook's study showed that those patients with blood-lymphocyte levels below 900 per cubic milli-

meter three months after TLI therapy had a much better prognosis than the controls. According to Dr. Cook, this seems to be a critical blood lymphocyte level. The patients who had placebo irradiation continued to deteriorate, as did those who got TLI, but kept a high lymphocyte count. But the group of TLI patients whose counts went below 900 did not deteriorate significantly during the time they were followed.

Another key factor, Dr. Cook reported, is those patients who received less radiation to the spleen tended to develop lower lymphocyte counts.

Dr. Cook points out that the lymphocyte count may represent a simple, inexpensive barometer for predicting which chronic progressive patients will remain stable or will regress after TLI treatment.

Dr. Cook's study was based on the growing acceptance that MS is an autoimmune disease in which lymphocytes circulating in the blood are thought to attack, directly or through antibodies, the myelin sheaths surrounding the nerve fibers of the brain and spinal cord. Destruction of the myelin blocks transmission of nerve impulses causing the recognized symptoms—loss of coordination, weakness, blurred vision, and others—and the steady decline of the patient over the years.

In the past, TLI therapy has been used to treat patients with lupus erythematosus, rheumatoid arthritis, kidney transplants, and Hodgkin's disease. As the study continues, Dr. Cook and his colleagues will be comparing the results with those of several other immunosuppressive therapies now being tested for MS including cyclophosphamide, azathioprine, cyclosporine, plasma exchange, and lymphocytapheresis.

Congratulations are in order for two members of our faculty:

Benjamin F. Rush, Jr., M.D., professor and chairman of the Department of Surgery at New Jersey Medical School, has been named the first recipient of a special chair in trauma surgery created to advance the study of critical emergency care.

Beckton Dickinson and Company endowed the \$1 million chair at the Newark-based school in honor of Wesley J. Howe, the Franklin Lakes health care company's chairman

and chief executive officer. The endowment was a gift to the Foundation of UMDNJ's \$27.5 million campaign to support key programs at the University.

Raymond A. Adelizzi, D.O., director of the rheumatology division at the School of Osteopathic Medicine, has been elected president of the Lupus Foundation of America, Southern New Jersey Chapter. Dr. Adelizzi, who had been a member of the chapter's board of directors and medical advisory board, also is acting director of the New Jersey Osteoporosis Society. Founded last year, the Stratford-based organization is one of the nation's first self-help groups for osteoporosis sufferers.

AMNJ Report

Benjamin F. Rush, Jr., M.D. President

The Academy's Education Committee under the chairmanship of Dr. Alfred Alessi held a retreat on October 13, 1988. The event was held at the Manor in West Orange; in addition to the Committee, members of the Board of Trustees and Section Officers participated. The agenda included a review of ongoing educational activities as well as a discussion of future initiatives.

The Academy and the Department of Surgery of UMDNJ-New Jersey Medical School sponsored: A General Surgery Review Course on September 30 and October 1, 1988, at the Hilton at Short Hills. The course, under the chairmanship of Dr. George W. Machiedo, provided an extensive review of the topics in general surgery and the surgical specialties, which are likely to be covered on the American Board of Surgery Recertification Examination as well as the Qualifying (written) Examination of the Board.

The Academy of Medicine's Annual Awards Dinner will be held on May 24, 1989, at the Chanticleer in Short Hills. Please reserve the date now and note that nominations for the Edward J. Ill and Citizen's Awards presently are being accepted.

The 13th Annual New Jersey Orthopaedic Symposium cosponsored by the New Jersey Orthopaedic Society was held on October 28 and 29, 1988, at the Hyatt Regency in New Brunswick, with Dr. Napoleon Val-

dez as program chairman, and Dr. Steven Berkowitz, as co-chair. The all-day program featured guest speakers: Dr. Sherman Coleman, University of Utah; Dr. Edward Craig, University of Minnesota; Dr. James Fox, Southern California Orthopaedic Institute; Dr. John Fulkerson, University of Connecticut; Dr. Robert Protzman, Orthopaedic Surgery Department of the John Peter Smith Hospital in Fort Worth, Texas; and Dr. Franklin Sim, Mayo Clinic. The symposium was designed to provide an opportunity for orthopaedists in the tristate area to hear timely topics of current interest presented by national leaders in various fields.

Dr. Robert Eisinger again will chair this year's *Internal Medicine Review Course*, scheduled to begin in mid-January and run for 19 Wednesdays from 4:00 P.M.-7:00 P.M. The course will be held at the Robert Wood Johnson University Hospital in New Brunswick. The course is cosponsored with UMDNJ-Robert Wood Johnson Medical School as well as Robert Wood Johnson University Hospital.

The course is designed to provide a comprehensive review of contemporary concepts in internal medicine. It is designed for practicing internists and family practitioners. The review also will be useful for residents in preparation for the ABIM examination. Syllabus material will be distributed during the course which, when compiled, will provide an extremely useful reference.

New Members

The Medical Society of New Jersey would like to welcome the following new members:

Atlantic County

Lawrence J. Anastasi, D.O., Margate City
John T. Bannon, M.D., Somers Point
Reva Dubin, M.D., Ventnor
Paul M. Kirschenfeld, M.D., Linwood
John A. Saia, D.O., Hammonton
Scott W. Strenger, M.D., Margate

Bergen County

Grace L. Adofa, M.D., Englewood
Gregory V. Babigian, M.D., Paramus
Herve M. Byron, M.D., Englewood
Zinaida Z. Chachashvili, M.D., Fair Lawn
John G. DeGhetto, Jr., D.O., Paramus
Serge Dumay, M.D., Bergenfield
Michael R. Gentile, M.D., Teaneck
Russell F. Guba, Jr., M.D., Cresskill
Jeffrey R. Lefkowitz, M.D., Fair Lawn
Kildeen E. Moore, M.D., Ramsey

Anthony P. Nicosia, M.D., Cliffside Park
Jonathan Smith, M.D., Ridgewood
Sunilkumar J. Vaidya, M.D., Lodi

Burlington County

Lewis M. Judy, M.D., Vincentown
Jesus Sosa, M.D., Willingboro

Camden County

Robert J. Biester, M.D., Collingswood
Donald L. Brody, M.D., Voorhees
Peter D. Buckman, M.D., Haddonfield
Anita P. Bulei, M.D., Upper Darby, PA
Linda R. DeGaeta, M.D., Camden
Norman J. Doherty, M.D., Voorhees
Marietta L. Galvez, M.D., Voorhees
Alan D. Kramer, M.D., Voorhees
Richard C. Laucks, M.D., Haddon Heights
Wendy Martinez, M.D., Cherry Hill
Kathleen M. Meehan, M.D., Voorhees
Cyrus Mohazzebi, M.D., Cherry Hill
Robin L. Perry, M.D., Blackwood
George J. Petruncio, M.D., Sewell
Barbara A. Rabb, M.D., Cherry Hill
Ping-An Tjoa, M.D., Cherry Hill

Cumberland County

Bernard E. Benson, M.D., Millville

Essex County

Alan W. Dunton, M.D., Newark
Robert J. Fieldman, M.D., West Orange
Thomas C. Hall, M.D., Newark
David J. Lange, M.D., West Orange
Stuart P. Leitner, M.D., Livingston
Patrick D. Manze, M.D., Chatham
Raphael S. Paisner, M.D., Verona
Ruby J. Sampson, M.D., Orange
Surekha U. Shah, M.D., Maplewood
Najam Wasty, M.D., Newark
Mathias Zemel, M.D., Newark

Hudson County

Gary P. Cardiello, M.D., Jersey City
Teofilo A. Dauhajre, M.D., Union City
John T. Dedousis, Jr., M.D., Bayonne
Adolfo C. Fernandez-Obregon, M.D., Hoboken
Karen L. Omilian, D.O., Union City
William F. Oser, Jr., M.D., Jersey City
Edwin P. Schulhafer, M.D., Hoboken
Gayle Shulman, M.D., Bayonne

Mercer County

Michael Y. Baaklini, M.D., Cranbury
Adolfo R. DeSandre, M.D., Lawrenceville
Robert R. Ford, M.D., Princeton
Steven R. Gecha, M.D., Princeton
Rene S. Gomez, M.D., Lawrenceville
Douglas R. Hough, M.D., Princeton
Daniel K. Jass, M.D., Pennington
Michael N. Jolley, M.D., Princeton
C. Alexander Moskwa, Jr., M.D., Princeton
Gregg S. Pressman, M.D., Mercerville
Ernest T. Roman, M.D., Mercerville
Moshe M. Rothkopf, M.D., Lakewood
David J. Sand, M.D., Lawrenceville
Michael A. Schiavone, M.D., Pennington
Alicia C. Tayao-Tesoro, M.D., Trenton
Arnold S. Witte, M.D., Trenton

Middlesex County

Charles H. Brown, M.D., Perth Amboy
Alieta R. Eck, M.D., Piscataway
David S. Goldstein, M.D., Iselin
Diane J. Kmec, M.D., Somerset
Joseph J. Perosi, M.D., Milltown
Dorothy M. Quail, M.D., North Brunswick

Audrey M. Weissman, M.D.,
North Brunswick
Donald W. Zarfes, M.D., Edison

Monmouth County

Jeffrey M. Beal, M.D., Ocean Grove
Steven G. Crawford, M.D., Neptune
Thomas C. Fiest, D.O., Ocean
Nasir H. Gardezi, M.D., Long Branch
Dominick A. Grosso, D.O.,
Atlantic Highlands
Marcus Hanfling, D.O., Red Bank
Margaret A. Lambert-Wooley, M.D.,
Long Branch
Nilesh J. Patel, M.D., West Long Branch
John Pelligra, M.D., Haledon
Robert J. Schuman, M.D., Valhalla, NY
Richard J. Scott, M.D., Red Bank
Stefano R. Tarantolo, M.D., South Amboy
Charles Valases, M.D., Long Branch
Louis J. Zinterhofer, M.D., Long Branch

Morris County

Irvin M. Bonder, M.D., Denville
Mitchell C. Chasin, M.D., Summit
Mary V. Daly, M.D., Morristown
Michael D. Dick, M.D., Morristown
Robert W. Dickson, M.D., Bridgeton
Pahirathi E. Haran, M.D., Morris Plains
Jory G. Magidson, M.D., Morristown
Shyamala Parimi, M.D., Dover
Patricia M. Renz, M.D., Rockaway
Richard S. Rosenberg, M.D., Morristown
Noel R. Sorvino, M.D., Mendham

Ocean County

Kevin F. Clancy, M.D., Toms River
James F. Clyde, M.D., Toms River
Cathleen O. Doane-Wilson, M.D.,
Fort Monmouth
Joseph E. Domanski, M.D.,
Point Pleasant
Rudolph E. Gronsky, D.O., Brick
Francis J. Kelly, M.D., Toms River

Physicians Seeking Location in New Jersey

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. If you are interested in any further information concerning these physicians, we suggest you make inquiries directly to them.

ALLERGY—Grant H. Greeley, M.D., 6305 Snow Heights Ct., El Paso, TX 79912. SUNY Downstate 1979. Also, internal medicine. Board certified. Also, board certified (IM). Partnership or multi-specialty group within commuting distance of New York City. Available May 1989.

ANESTHESIOLOGY—Michael Silverberg, M.D., 2020 Walnut St., Apt. 29K, Philadelphia, PA 19103. Yale 1983. Board eligible. Available. July 1989.

FAMILY PRACTICE—Neil S. Skolnik, M.D., 1114 Spruce St., Philadelphia, PA 19107. Emory 1984. Board certified. Group or partnership. Available.

GASTROENTEROLOGY—Howard P. Fritz, M.D., 14 Baldwin Ct., Newington, CT 06111. St. Louis 1984. Also, internal medicine. Board eligible. Board certified (IM). Available July 1989.

K. Suresh Reddy, M.D., 280 Henderson St., #16J, Jersey City, NJ 07302. Kakatiya Medical College (India). Also, internal medicine. Board eligible. Board certified (IM). Solo or group. Available June 1989.

INTERNAL MEDICINE—Diane Barton, M.D., Village of Stoney Run, Apt. 571,

Maple Shade, NJ 08052. Temple 1984. Board eligible. Group, partnership, solo. Available July 1989.

Howard P. Fritz, M.D., 14 Baldwin Ct., Newington, CT 06111. St. Louis 1984. Also, gastroenterology. Board certified. Available July 1989.

Grant H. Greeley, M.D., 6305 Snow Heights Ct., El Paso, TX 79912. SUNY Downstate 1979. Also, allergy. Board certified. Also, board certified (ALLERGY). Partnership or multispecialty group within commuting distance of New York City. Available May 1989.

K. Suresh Reddy, M.D., 280 Henderson St., #16J, Jersey City, NJ 07302. Kakatiya Medical College (India). Also, gastroenterology. Board certified. Solo or group. Available June 1989.

NEURORADIOLOGY—Jerome G. Wiot, M.D., 803 East 6th St., #401, Newport, KY 41071. Cincinnati 1982. Board certified. Group or academic. Available July 1989.

NEUROSURGERY—Hae Dong Jho, M.D., Ph.D., 8327 Elaine Dr., Pittsburgh, PA 15237. Chonnam University 1971. Board eligible. Group, partnership, solo. Available June 1989.

OPHTHALMOLOGY—William Brian Neusidl, M.D., 200 Riverfront Pk., Apt. 13C, Detroit, MI 48226. Temple 1984. Board eligible. Available July 1989.

ORTHOPEDIC SURGERY—Paul Bizzigotti, M.D., 230 E. 12 St., #7A, New York, NY 10003. NYU 1981. Board eligible. Group or partnership. Available. Joseph M. Grant, M.D., Naval Hospital, Box 8, FPO, San Francisco, CA. UMDNJ 1980. Board eligible. Group or partnership. Available July 1989.

PEDIATRICS—Elizabeth Lubas, M.D., 508 Third St., Lyndhurst, NJ 07071. Boston University 1986. Board eligible. Group or partnership. Available.

RADIOLOGY—Joseph M. Ullman, M.D., 148 Chestnut Crossing Dr., Apt. 1, Newark, DE 19713. George Washington 1984. Board eligible. Group, partnership, community hospital, outpatient imaging center. Available July 1989.

SURGERY—M. Amawi, M.D., 1904 Barham Blvd., Dodge City, KS 67801. Board certified. Group or partnership. Available.

Approved for CME, AOA and AAFP credits.

CLINICAL UPDATE PULMONARY MEDICINE

COURSE DESCRIPTION:

December 7, 1988

The 5th Annual Clinical Update is designed to provide family practitioners, general internists, pulmonologists and other interested physicians with an updated review of pulmonary disorders which are commonly encountered in clinical practice as well as certain disorders which are of current topical interest. The program has been carefully selected to ensure a good blend of established and new methods and approaches to pulmonary diseases.

The morning session will provide participants with systematic approaches to chest x-ray interpretation, pleural effusion, atypical pneumonias (*Legionella*, *Mycoplasma*, *Chlamydia*, viral, fungal) and pulmonary disorders produced by cardiovascular disease.

The afternoon session will present current concepts in the diagnosis and management of idiopathic pulmonary fibrosis and lung cancer. A special lecture will focus on the current status of lung transplantation for end-stage pulmonary disease. This session will conclude with a discussion of the pulmonary assessment and management of the surgical patient with lung disease.

Throughout the day, emphasis will be placed on risk factors, natural history, early detection, prognosis, newer diagnostic techniques and new methods of therapy.

A.M.	MORNING SESSION	P.M.	AFTERNOON SESSION
8:00	Registration	12:30	Luncheon
8:50	Welcome— <i>Vladir Maranhao, M.D.</i>	1:30	Clara Falk Franks Lecture—Clinical Decisions in Idiopathic Pulmonary Fibrosis <i>J.A. Peter Paré, M.D.</i>
9:00	A Practical Guide to Chest X-Ray Interpretation <i>Wallace T. Miller, M.D.</i>	2:20	Lung Transplantation for End-Stage Pulmonary Disease <i>Joel D. Cooper, M.D.</i>
9:50	Differential Diagnosis of Pleural Effusions <i>Steven A. Sahn, M.D.</i>	3:10	Coffee Break
10:40	Coffee Break	3:25	Lung Cancer in 1988—Staging and Expectations of Surgery <i>Joel D. Cooper, M.D.</i>
10:55	Pulmonary Disorders Produced by Cardiac Disease <i>David M.F. Murphy, M.D.</i>	4:15	Reducing the Risk of Postoperative Pulmonary Complications <i>Mervyn Feierstein, M.D.</i>
11:45	The Spectrum of Atypical Pneumonias <i>Steven A. Sahn, M.D.</i>	5:00	Adjourn

Tuition: All participants, fee includes luncheon and refreshments—\$80.00.

A check in the amount of \$80.00 payable to Deborah Heart and Lung Center should accompany this application. Mail to Pulmonary Department, Deborah Heart and Lung Center, Browns Mills, N.J. 08015.

Due to limited seating capacity, early registration is strongly advised.

For Program Information please call: Mrs. Diane Colby (609) 893-6611.

Registration deadline—Wednesday, November 23, 1988.

Accreditation: Deborah Heart and Lung Center designates that this continuing education offering meets the criteria for 6.5 credit hours in category 1 of the Physician's Recognition Award of the American Medical Association.

This program has been reviewed and is acceptable for 6.5 prescribed hours by the American Academy of Family Physicians.

CME CALENDAR

The following is a list of continuing medical education courses for the next two months. Contact the sponsoring organization (indicated in italics) for further information.

ALLERGY

December

- 9- **Allergy and Nutrition**
11 7:30 A.M.-4:30 P.M.—The Pointe at Tapatio Cliffs, Phoenix, Arizona (*Holy Name Hospital*)

ANESTHESIOLOGY

January

- 17 **Postanesthetic Apnea in the Former Premature Infant**
6-10 P.M.—Ramada Inn, Clark (*NJSSA*)

CARDIOLOGY

December

- 1 **Valvuloplasty**
11 A.M.—St. Joseph's Hospital and Medical Center, Paterson (*St. Joseph's Hospital and Medical Center*)
- 8 **How To Decide on Therapy for Acute Myocardial Infarction**
12 noon-1:30 P.M.—Somerset Medical Center, Somerville (*AMNJ*)
- 20 **Advances in the Treatment of Arrhythmias**
9-10 A.M.—Holy Name Hospital, Teaneck (*Holy Name Hospital*)

January

- 13 **Angioplasty**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (*Bridgeton Hospital*)

- 18 **Cardiology**
10:30-11:30 A.M.—Christ Hospital, Jersey City (*Christ Hospital*)
- 27 **Thromboembolism and Thrombolytic Therapy**
7:30-8:30 A.M.—Atlantic City Medical Center, Atlantic City (*AMNJ*)

DERMATOLOGY

January

- 10 **Dermatological Society of New Jersey**
7-10 P.M.—Shering-Plough Corporation, Kenilworth (*Dermatological Society of New Jersey*)
- 12 **Principles of Dermatologic Therapy**
1:30-2:30 P.M.—Vineland Developmental Center, Vineland (*AMNJ*)

INFECTIOUS DISEASES

December

- 6 **Clinical Management of HIV Infection**
8-9 A.M.—Underwood Memorial Hospital, Woodbury (*AMNJ and NJSDOH*)
- 7 **Clinical Management of HIV Infection**
11:30 A.M.-12:30 P.M.—Hamilton Hospital, Trenton (*AMNJ and NJSDOH*)
- 7 **Counseling and Testing for HIV Infection**
1-2 P.M.—VA Medical Center, Lyons (*AMNJ and NJSDOH*)
- 7 **Clinical Management of HIV Infection**
1:30-2:30 P.M.—Essex County Hospital Center, Cedar Grove (*AMNJ and NJSDOH*)
- 13 **Counseling and Testing for HIV Infection**
8-9 A.M.—Underwood Memorial Hospital, Woodbury (*AMNJ and NJSDOH*)
- 14 **Counseling and Testing for HIV Infection**
8-9 A.M.—Passaic County Medical Society, Clifton (*AMNJ and NJSDOH*)
- 21 **Clinical Management of HIV Infection**
11:30 A.M.-12:30 P.M.—Rahway Hospital, Rahway (*AMNJ and NJSDOH*)

January

- 11 **Counseling and Testing for HIV Infection**
11:30 A.M.-12:30 P.M.—Rahway Hospital, Rahway (*AMNJ and NJSDOH*)
- 11 **Clinical Management of HIV Infection**
1:30-2:30 P.M.—Roosevelt Hospital, Metuchen (*AMNJ and NJSDOH*)
- 20 **Counseling and Testing for HIV Infection**
9-10 A.M.—Union Hospital, Union (*AMNJ and NJSDOH*)

MEDICINE

December

- 2 **Thermography**
11:30 A.M.-12:30 P.M.—St. Lawrence Rehabilitation Center, Lawrenceville (*St. Lawrence Rehabilitation Center*)
- 2 **Hyperlipidemia**
12 noon-1 A.M.—Bridgeton Hospital, Bridgeton (*Bridgeton Hospital*)
- 2 **Developmental Disabilities: Specific Dysfunctions**
1-2 P.M.—Woodbine Developmental Center, Woodbine (*AMNJ*)
- 6 **Antibiotics and Renal Disease**
9-10 A.M.—Holy Name Hospital, Teaneck (*Holy Name Hospital*)
- 6 **Problems in Neoplastic Management**
7-8 P.M.—West Hudson Hospital, Kearny (*West Hudson Hospital*)
- 7 **Living Wills**
10:30-11:30 A.M.—Christ Hospital, Jersey City (*AMNJ*)
- 7 **Early Office Recognition of Depression**
1:30-2:30 P.M.—Essex County Hospital Center, Cedar Grove (*AMNJ*)
- 7 **New Dimensions in Medical Education**
Learning Center, Englewood Hospital, Englewood (*Association for Hospital Medical Education of New Jersey*)
- 8 **Conservative Management of Osteoarthritis and Indications for Total Joint Arthroplasty**
11 A.M.—St. Joseph's Hospital and Medical Center, Paterson (*St. Joseph's Hospital and Medical Center*)
- 9 **How To Live To Be 106**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (*Bridgeton Hospital*)
- 13 **The Pharmacologic Management of Pain**
9-10 A.M.—Holy Name Hospital, Teaneck (*Holy Name Hospital*)
- 13 **Nutritional Support**
12 noon-1 P.M.—Hospital Center at Orange, Orange (*AMNJ*)
- 14 **Emphasis on Significant Length and Quality of Life as Preconditions for Approval for Organ Transplantation**
1-2 P.M.—West Hudson Hospital, Kearny (*West Hudson Hospital*)
- 14 **Organ Procurement—Clinical Aspects**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (*AMNJ*)
- 14 **How To Heal a Broken Heart**
6:15-9 P.M.—Perona Farms,

THE PHILADELPHIA HEART INSTITUTE
of Presbyterian—University of Pennsylvania Medical Center

CARDIOLOGY UPDATE

designed for the physician and provides an intensive survey of the
current status of clinical cardiology

Wednesday
December 7, 1988
3:00-5:00 PM

**Prevention and Management of
Acquired Heart Disease**

Moderator
Bernard L. Segal, M.D.

- 3:00-3:30** Which lipid lowering agents are appropriate for patients with
hyperlipidemia and when? Garo S. Garibian, M.D.
3:30-4:00 When is cardiac catheterization not indicated before surgery
in acquired cardiac disease? Jan R. Weber, M.D.
4:00-5:00 Case Presentations Barbara Kong, M.D.
Panel Discussion Jai B. Agarwal, M.D.
Harold R. Kay, M.D., Peter G. Lavine, M.D.
J. David Ogilby, M.D.

LETTERS TO THE EDITOR

Carotid Vascular Disease; Hospital Corridor Prescribing; Not Just for Laughs

Carotid Vascular Disease

September 7, 1988

Dear Doctor Slobodien:

Drs. Bazewicz, Sandler, and Cohn make an important statement when they indicate that noninvasive cerebrovascular studies are of sufficient accuracy that they may preclude the need for diagnostic contrast imaging of internal carotid artery lesions in the June issue of *New Jersey Medicine*.¹ They utilized oculoplethysmography (OPG), doppler spectral analysis (SA), supraorbital bidirectional doppler flow studies (SOF), and B-mode imaging for evaluations. Our laboratory has supplemented these studies with carotid phonangiography (CPA). CPA utilizes an electronic stethoscope with a graphic analysis to evaluate carotid bruits.² The degree of stenosis can be estimated by the characteristics of the bruits. Diastolic bruits indicate a stenosis of greater than 85 percent. Pan-systolic bruits indicate a stenosis of 40 to 85 percent, depending upon the pitch of the bruits, the higher pitched bruits correlating with a greater stenosis. Short systolic bruits usually indicate a lesser degree of stenosis. We have found that CPA provides important supplemental information in the nonin-

vasive evaluation of the carotid circulation.

Hospital Corridor Prescribing

August 22, 1988

Dear Doctor Slobodien:

As president of the New Jersey State Board of Medical Examiners, I wish to echo the advice and concern expressed in the August issue of *NEW JERSEY MEDICINE* concerning hospital corridor prescribing (page 644).

This Board has had to investigate physicians who have prescribed controlled dangerous substances to hospital personnel during corridor meetings. The investigations have revealed that the prescribing is done without proper physical or history examination, and patient records are not prepared. The physician later has discovered that he was duped in that the "patient" also was receiving medication in a familiar manner from other physicians in the hospital. Physicians should avoid the temptation of accommodating a colleague or other health care professionals by prescribing contrary to good medical practice. Such corridor encounters should alert physicians to this problem which might lead to the aiding and abetting of a drug-dependent person.

(signed) Frank J. Malta, M.D.

Not Just for Laughs

Dear Doctor Slobodien:

One of the greatest problems that we face in promoting our good intentions is the limited attention span of our busy colleagues.

With this in mind, I have long striven to develop one-liners, which would "say it all." Some of those attempts have endeared me to those who shared my viewpoint, and

further antagonized the targets of my barbs. In either case, it got their attention!

We live in a world of acronyms. In our patient education duties we should explain that while chicken soup may have a therapeutic value, alphabet soup can often be hazardous to their health.

Making up alternative definitions for the multitude of initials with which we daily deal can be a relaxing diversion. I intend to write a book on the subject, but I do not mind sharing a few of them with you.

There have been numerous twists on DRGs, but my original version, "danger of regulation by government," sounds better as time goes by.

You must all be familiar with the recent flap over including the RAPs (radiologists, anesthesiologists, and pathologists) under hospital DRG payments. Emergency room (ER) physicians originally were included as part of the package. They were eventually excluded, not because of any benevolent consideration, but more likely because that acronym would have more accurately described the process as RAPE.

As second, third, and fourth generation derivatives of HMOs have evolved, but listing them all, with the inevitable "etc." to cover those which surfaced between writing and publication, has wasted a lot of space. My solution is to refer to all as HMOs and OOPs. OOPs are defined as "other objectionable programs." OOPs, as a word, is defined in the dictionary as an expression, used typically to express mild apology, surprise, or dismay. I find that most fitting.

The latest entry, SHMOs, supposedly stands for social health maintenance organizations. They had me fooled for awhile, since I thought the program had been named for its originators.

My major project, in this vein, is to encourage people to refer to socialized medicine as S&M. To any of you who are unfamiliar with kinky sex or psychiatry, S&M is the abbreviation for sadism and masochism. Think about it. What better or clearer way is there to characterize this impending atrocity?

If you have any personal favorites, please pass them along to me.

Current Trends in Urology; Dentistry, A Historical Perspective; Interventional Radiology; Magnetic Resonance Annual; Magnetic Resonance Imaging; Management of Ocular, Orbital, and Adnexal Trauma; Sports Science Perspectives for Women

Current Trends in Urology, Volume 4

Martin I. Resnick, M.D., (ed). Baltimore, MD, Williams and Wilkins, 1988 Pp. 190. (\$48.50)

It is hard to believe another book dealing with new problems in urology could serve a useful purpose, but this text does. Dr. Resnick and outstanding experts have written about ten of the major problems in urology. Tom Lue summarizes the current thought on impotence therapy. Barry Stein discusses the laser. Donald Bodner writes about spinal cord injuries. William Catalona describes the nerve sparing radical prostatectomy. Drs. Zekan and Muss give us the current thinking on systemic chemotherapy, and Drs. Kowalkowski and Lamm do the same for intravesical chemotherapy. Edward McGuire writes about female incontinence. Drs. Hursey, Doornbos, and Jani describe radiation therapy for cancer of the prostate (in rather too much detail for most urologists). Drs. Olssen, Benson, Sawczuk, and Blaivas give their views and techniques of bladder substitution, and Paul Lange comments on testicular tumors.

Much of the literature is summarized here in a generally practical and common sense way. I felt I learned something from this book, and I think other urologists will, too.

Robert Zufall, M.D.

Dentistry, A Historical Perspective

Milton B. Asbell. Bryn Mawr, PA, Dorrance & Company, 1988. (\$24.95)

Written by a scholar who is the dean of dental historians in New Jersey and a recognized national authority, this book marks the culmination of many years of study devoted to the rise of dentistry throughout the ages. Although primarily interested in the dental history of our own country, Dr. Asbell takes us back to antiquity and through the Middle Ages and Renaissance, down to modern times.

By the 17th century, teeth already were becoming the subject of increasing scientific scrutiny and the qualifications of the surgeon-dentist as opposed to the barber and quack were being supervised carefully by the College de Saint-Come in Paris. But the rise of dentistry as a modern specialty can be traced to the work of Pierre Fouchard whose pivotal work, *Le Chirurgien Dentiste*, (1728) was widely translated and became the classic approach to the subject.

The major portion of the book is devoted to a highly detailed account of the development of dental science in our own country. Beginning with the colonial period, the author traces the progress in dental care; the opening of the first school in the world devoted to this specialty in Baltimore in 1840; the use of nitrous oxide in extractions (1840); and other major improvements. We can all take pride in the enormous advances in dentistry resulting from Yankee ingenuity. This book is highly recommended to everyone who would like to know more about American contributions to the preservation of the teeth.

Morris H. Saffron, M.D., Ph.D.

Interventional Radiology

Wilfredo Castañeda-Zuinga and S. Murthy Tadovarthi. Baltimore, MD, Williams & Wilkins, 1988. Pp. 1,250. (\$125)

This volume, the latest addition to the extensive series known as the

golden diagnostic series, places more emphasis on the philosophy of interventional radiology than on its specific techniques; however, those techniques do receive attention.

After opening with a discussion of the use of extracranial embolization and ablative therapy in the body, the text reviews both angioplasty and fibrolytic techniques. IVC filters and the intravascular removal of foreign bodies figure in the discussion of the vascular system. The discussion of interventional genitourinary radiology is thorough and especially good. Newer areas such as the use of ferromagnetic microembolization, laser angioplasty, and dilation of gastrointestinal strictures are included.

The very well-written text is accompanied by excellent radiographs, photographs of equipment (catheters and guidewires), and line drawings. Each well-researched topic provides background descriptions about the design as well as brief accounts of the related techniques and their followup, noting possible complications.

Overall, the book does fulfill its purpose admirably. Although the physician who wishes to learn the techniques in greater detail may wish to consult its bibliography, *Interventional Radiology* plays an essential role for the physician in search of greater understanding of the field as a whole.

Neil B. Horner, M.D.

Magnetic Resonance Annual 1988

Herbert Y. Kressel, M.D., (ed). New York, NY, Raven Press, 1988. Pp. 357. (\$73)

This volume is fourth in an annual series of monographs providing excellent reviews of the field of magnetic resonance imaging (MRI). The series has continued to present clinical as well as theoretical developments of MRI.

The clinically oriented chapters discuss diseases of the knee joint, hip joint, temporomandibular joint (TMJ), and the heart. The format is similar for all these areas; a review of normal anatomy is followed by a description of pathological entities. The section about TMJ especially is well done and includes many high-quality illustrations. One of the chapters gives focus to gadolinium,

which recently won approval as a contrast agent; herein is a presentation of its pharmacokinetic properties, its appearance at different pulse sequences, and its use for the entire body.

In addition to describing technical innovations, this consistently well-written text takes up the topic of MR artifacts, rapid MR techniques, and cerebrospinal fluid flow-physiology.

The book is highly recommended to the physician who wishes both clear and concise discussions of the advances in the field.

Neil B. Horner, M.D.

Magnetic Resonance Imaging

David D. Stark, M.D., William G. Bradley, Jr., M.D., Ph.D., (eds). St. Louis, MO, C.V. Mosby, 1988. Pp. 1,546. (\$140)

The editors of this large text have produced a superior book, encompassing the wide scope of current magnetic resonance imaging (MRI). The review of the physical principles, for example, spans 20 chapters and includes a discussion that ranges from flow principles to safety considerations. Although they are presented with clarity, several chapters are expressed in a more complex manner than the average physician might desire in the way of introduction.

The imaging of the body is approached in a two-part manner; the central nervous system and the remainder of the body. The brain and spine are reviewed extensively in terms of different disease entities including ischemia, multiple sclerosis, and hemorrhage; a separate chapter is devoted to pediatric disorders.

The "body" section includes head

and neck disorders; it discusses cardiac imaging as well as diagnostic study and obstetrics; again, a chapter is set aside for pediatric disorders.

The chapters are impressive for their thorough research and for their range. The high-quality scans make liberal use of line drawings and computed tomography scans.

To best describe this text, one must say that it is excellent encyclopedia, and a boon to the physician involved in the field.

Neil B. Horner, M.D.

Management of Ocular, Orbital, and Adnexal Trauma

Thomas C. Spoor, M.D., and Frank A. Nesi, M.D., (eds). New York, NY, Raven Press, 1988. Pp. 445. (\$88.50)

Management of ocular trauma certainly is an important topic in ophthalmology. Effective management often is a multidisciplinary task. The authors of this text bridge the gap between specialties. Consistent with the background of the editors, a major part of the book deals with orbital and neuro-ophthalmologic trauma. Extremely important is the chapter on neuro-ophthalmologic manifestations. Dr. Spoor's diagrams of the neural pathways and visual fields are excellent.

In general, the text contains excellent diagrams, but some of the photographs lack proper contrast. The chapter on ultrasonography in trauma especially is informative. The only drawback is that found in any multiauthored text: many of the sections contain repetitive material. This may cause the reader to skip over important sections.

In summary, the editors of this

text make an important contribution to the ophthalmic literature by presenting an updated, multidisciplinary approach to the management of ocular trauma. This book is a good addition to any reference library, and is useful for anyone dealing with ocular and orbital trauma.

Donald J. Cinotti, M.D.

Alfonse A. Cinotti, M.D.

Sports Science Perspectives for Women

Jacqueline L. Puhl, Ph.D., C. Harmon Brown, M.D., Robert O. Voy, M.D., (eds). Champaign, IL, Human Kinetics Books, 1988. Pp. 248. (\$28)

For the neophyte in sports medicine or the medical specialist unfamiliar with aspects of the field not normally encountered in practice, *Sports Science Perspectives for Women* is an excellent text. It concisely covers the physiological, psychological, physical therapy, and training and conditioning aspects of sports medicine as well as reviews such topics as injuries, pregnancy, and menstrual disorders seen specifically in the female athlete.

The nutritional concerns of the athlete with special emphasis on the eating disorders and obesity problems in the female athlete also are addressed in some detail.

Although familiar with most of the topics in the text, the reviewer found the book to be a good update on the topics discussed and gleaned some new material of note.

The book is worth having on the shelf in any physician's office who deals with active, athletic females, as a quick reference and as an aid in problem solving for patients.

Christine E. Haycock, M.D.

***Drs. Del Guercio;
Dell'Aquila; Dimun; Duty;
Hawes; Inge; Sawchuck;
Seymour; Stewart***

Medicine, Italy, in 1960. He completed an internship at Presbyterian Hospital, Newark, in 1962. Dr. Dell'Aquila was a member of our Essex County component; he was affiliated with West Hudson Hospital, Kearny.

Dr. John T. Dimun

John Theodore Dimun, M.D., 82, died on August 18, 1988. Born in 1906 in Trenton, Dr. Dimun received his medical degree from the University of Pennsylvania Medical School in 1931. He completed his residency training at St. Francis Hospital, Trenton, and in 1957 became chief of medical services for the hospital. He had a private practice in his hometown since 1932, and was a consultant for the Department of Medicine at St. Francis Hospital until 1986. Dr. Dimun was a member of our Mercer County component and of the American Medical Association.

Dr. Edward R. Duty

Edward Richard Duty, M.D., a psychiatrist from Morristown, died on August 16, 1988. Born in 1925 in Arkansas, Dr. Duty received his medical degree from the University of Arkansas School of Medicine in 1948. He was director of psychiatry at Bergen Pines County Hospital, and affiliated with Fair Oaks, Inc., as clinical director. Dr. Duty was a member of our Morris County component, of the American Psychiatric Association, of the American Medical Association, and of the Arkansas Medical Society.

Dr. Vernon L. Hawes

Retired Ramsey family physician Vernon Lee Hawes, M.D., 82, died on June 18, 1988. Born in Rose Hill, North Carolina, Dr. Hawes received his medical degree from Jefferson Medical College of Philadelphia, Pennsylvania, in 1929. He practiced medicine in Ramsey from 1930 until 1970, and was the borough's school and sports physician. Dr. Hawes also maintained affiliations with The Valley Hospital, Ridgewood, and Hackensack Medical Center. He was a U.S. Army veteran of World War II, having served in the medical corps as a major. Dr. Hawes was a member of our Bergen County component and of the AMA. He was a 1979 recipient of the Golden Merit Award.

Dr. Theodore R. Inge

Theodore R. Inge, M.D., a member of our Essex County component, died on August 8, 1988. Born in 1901, Dr. Inge was graduated from University of Minnesota Medical School in 1928. A surgeon and family practitioner, Dr. Inge was a member of the American Medical Association, and was the first black physician appointed to the staffs of General Hospital, East Orange, and Newark Beth Israel Medical Center. During his career, Dr. Inge was the police surgeon for the city of Orange, and senior attending physician of the Essex County Geriatrics Center. He received MSNJ's Golden Merit Award.

Dr. Steven Sawchuck

Word has been received of the death of Steven Sawchuck, M.D., a member of our Middlesex County component. Born in 1916, Dr. Sawchuck received his medical degree from Temple University School of Medicine, Philadelphia, in 1943. During his career, Dr. Sawchuck was affiliated with Johnson and Johnson, in New Brunswick. Dr. Sawchuck was a member of the American Medical Association, a diplomate of the American Board of Pediatrics, and a clinical assistant professor at Temple University.

Dr. Edward T. Seymour

Edward Thomas Seymour, M.D., died at the age of 88. Dr. Seymour received his medical degree in 1926 from Ohio State University Medical School. A family practitioner from Tenafly, Dr. Seymour was affiliated with Englewood Hospital; he was a member of our Bergen County component and of the American Medical Association. At the time of his death, Dr. Seymour was retired and residing in Nashville, Tennessee.

Dr. Robert G. Stewart

Robert George Stewart, M.D., a retired member of our Essex County component died in February 1988. Born in 1895, Dr. Stewart received his medical degree from Cornell Medical School, New York, in 1921. During his career, Dr. Stewart was affiliated with The Mountainside Hospital, Montclair, as a surgeon; he was a member of the American Medical Association.

Dr. Olindo Del Guercio

Retired for 20 years from gynecology practice, Olindo Del Guercio, M.D., 89, died on June 7, 1988. Born in Teora, Italy, Dr. Del Guercio received his medical degree in 1923 from the Faculty of Medicine, University of Naples, Italy. He emigrated to the United States in 1926, and became affiliated with St. Michael's Medical Center, Newark. Dr. Del Guercio was a veteran of both World Wars, serving in the Italian army during World War I, and the United States Army during World War II. He was a member of our Essex County component and of the AMA. In 1973, Dr. Del Guercio received the Medical Society of New Jersey's Golden Merit Award, in recognition of his 50 years of medical practice.

Dr. Richard N. Dell'Aquila

Word has been received of the death of family practitioner Richard Nicholas Dell'Aquila, M.D. Born in 1932 in Newark, Dr. Dell'Aquila was awarded a medical degree from the University of Bologna School of

STATEMENT OF OWNERSHIP, MANAGEMENT, AND CIRCULATION

(Required by 39 U.S.C. 3685)

1. Title of Publication: NEW JERSEY MEDICINE.

1A. Publication No.: 00257524.

2. Date of Filing: October 7, 1988.

3. Frequency of Issue: Monthly.

3A. No. of Issues Published Annually: 12.

3B. Annual Subscription Price: \$35.00.

4. Location of Known Office of Publication: 2 Princess Road, Lawrenceville, Mercer County, NJ 08648.

5. Location of Headquarters or General Business Office of the Publisher: 2 Princess Road, Lawrenceville, Mercer County, NJ 08648.

6. Names and addresses of publisher, editor, and managing editor: Publisher, Medical Society of New Jersey, 2 Princess Road, Lawrenceville, NJ 08648. Editor, Howard D. Slobodien, M.D., 2 Princess Road, Lawrenceville, NJ 08648. Managing Editor, Geraldine R. Hutner, 2 Princess Road, Lawrenceville, NJ 08648.

7. Owner (if owned by a corporation, its name and address must be stated and also immediately thereunder the names and addresses of stockholders owning or holding 1 percent or more of total amount of stock. If not owned by a corporation, the names and addresses of the individual owners must be given. Director of Finance and Administrative Services

12. For completion by publishers mailing at the regular rates (Section 132.121, Postal Service Manual). 39 U.S.C. 3626 provides in pertinent part: "No person who would have been entitled to mail matter under former section 4359 of this title shall mail such matter at the rates provided under this subsection unless he files annually with the Postal Service a written request for permission to mail matters at such rates." In accordance with the provisions of this statute, I hereby request permission to mail the publication named in Item 1 at the phased postage rate presently authorized by 39 U.S.C. 3626 (signed).

AUTHOR INFORMATION

NEW JERSEY MEDICINE is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in NEW JERSEY MEDICINE is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

Feel helpless about the high cost of health care? *There are some things you can do!*

Your doctor shares your concerns. The latest Health Care Financing Administration figures based on the cost for National Health Expenditures in 1986 totaled 458.2 billion dollars. Physicians' services accounted for 92.0 billion dollars of the total expenditure (approximately 20%).

The rest was expended on other health services and supplies. While the cost of medical care has continued to escalate since 1986, physicians have had a freeze on their Medicare fees for the last three years. Doctors are doing their part to help control the upward spiral of medical costs.

You are the silent majority — now is the time to speak up. Bureaucratic constraints on the

budgeting of funds for the delivery of health care may look good in an election year but they are devastating to the quality of health care.

Ask your legislators to review the DRG and Medicare payment programs.

You can help — write for a list of 10 Ways to Cut Your Medical Bills.

AIR FORCE MEDICINE— AN ATTRACTIVE ALTERNATIVE TO PRIVATE PRACTICE.

Are you sick of the paperwork battle? Are you more familiar with the latest computer technologies instead of those of your specialty? Are supply and equipment problems getting you down? Join the Air Force medical team. Concentrate on your medical practice. Leave the paperwork hassle to others. We use the group practice system of health care. It allows maximum patient/physician contact with a minimum of administrative responsibilities. You'll get to use those skills you've gained through the years of education; to stay up with new methods and techniques; and, if qualified, to specialize. Our superior employment and benefits package make Air Force medicine an attractive alternative to private practice. Find out how you can be a part of the Air Force health care team. Without obligation, call

1-800-423-USAF

STAFF PSYCHIATRIST

Tired of breathing polluted air? Irritated at having to pay private school tuition in addition to taxes for your children's education? Weary of spending two hours a day commuting? Unhappy having to triple lock your doors and still be concerned for your family's safety? Then strongly consider moving to Knoxville, Iowa. Contemporary hospital based psychiatry with friendly colleagues who keep up with their medical fields. All the advantages of working for VAMC with paid vacation, sick leave, reasonable workload, appreciative patients and staff. Day Care Center on station available to VAMC working parents. (You may have lunch with your child.) Iowa Public High School students consistently score higher than other 49 states on S.A.T.'s. All cultural opportunities available in Chicago or Minneapolis (4-5 hours by car). Knoxville is a friendly, up-to-date town with contemporary stores. Des Moines (state capital) is less than one hour away by car. If you think this is too good to be true, call Dr. Lynn Huebler, 515-842-3101, Ext. 6003, and arrange to visit for an interview.

Equal Opportunity Employer.

"SELLING PRACTICES IS OUR BUSINESS"

Want to maximize the return on your investment? Before you buy or sell, call for an appraisal to assure the best financial and transfer terms. We are a full service practice broker, not simply a listing service. Since 1981, Countrywide has been instrumental in helping hundreds of doctors like yourself buy and sell their practices. We guide you through the entire sales process from initial meeting to closing. Our offices serve New Jersey, New York and New England.

For the brain/bowel conflict of IBS*

Specify
Adjunctive

LIBRAX®

THE PEACEMAKER.

Antianxiety
Antisecretory
Antispasmodic

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows: "Possibly" effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis. Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur. Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such

as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. After extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

be sure to initial
line of your prescription.

When it's brain versus bowel,

IT'S TIME FOR THE PEACEMAKER.

In irritable bowel syndrome,* intestinal discomfort will often erupt in tandem with anxiety—launching a cycle of brain/bowel conflict. Make peace with Librax. Because of possible CNS effects, caution patients about activities requiring complete mental alertness.

*Librax has been evaluated as possibly effective as adjunctive therapy in the treatment of peptic ulcer and IBS.

**"Medical training taught
me how to cure.
Senior Patient helps
me to care."**

Introducing a new "how to" publication for treating senior patients.

Senior Patient provides practical information designed to help you manage the care of your senior patients.

Its fresh approach in medical journalism presents short, easy-to-read, original articles on a broad range of subjects including emotions and coping, family relationships, death and dying, sleep disorders, community services, relations with institutions, and financial problems and their relation to health.

Each issue also offers "Pearls" from the personal experiences of other physicians, "Quick Currents" about what is happening in legislation relating to senior care, and an "Open Forum" in which readers can react and interact.

It's a concise, informative, "how to" approach in caring.

The appearance of advertising in *NEW JERSEY MEDICINE* is not a Medical Society of New Jersey guarantee or endorsement of the product or service, or the claims made for the product or service, by the advertiser. When MSNJ has endorsed a product or program, that will be expressly noted.

We'll put your patients up on a pedestal.

The Stone Center of New Jersey, the leader nationwide in lithotripsy advancement, is the premier center in the country to offer the bath-free Dornier HM-4 lithotripter.

At the Stone Center your patients rest comfortably on a water filled cushion...

utilizing the most advanced lithotripsy technology available.

Because they are not submerged in a tub, the procedure is less stressful and easier to perform.

Your patients are treated in a sophisticated atmosphere by the state's top lithotripsy professionals. From our convenient

valet parking to our helpful and efficient patient representative who will schedule your cases...you'll rate our service second to none.

So contact Arlyn Rayfield, Executive Director, today and schedule an appointment for machine demonstrations or to receive additional information on ESWL[®] treatment.

Because your patients deserve to be put up on a pedestal.

The Stone Center of New Jersey. For the new wave in kidney stone treatment.

DALE L. TIPTON, M.D.

Associate Clinical Professor, Department of Otolaryngology, Head and Neck Surgery, University of California School of Medicine, San Francisco, California.
Chairman, Division of Otolaryngology, Franklin Hospital, San Francisco, California.
Lieutenant Colonel, U.S. Army Reserve.

EDUCATION University of California at Berkeley, A.B. Physiology; University of California School of Medicine, San Francisco, M.D. and Master of Science, Pharmacology.

RESIDENCY University of California School of Medicine, San Francisco: General Surgery—2 years; Otolaryngology—3 years.

FELLOWSHIPS National Institute of Health Fellow; Cancer Research Institute, University of California, San Francisco.

OUTSTANDING ACHIEVEMENTS Freshman Medical Student Research Award; Class President—2nd year medical school; Student Body President—senior year medical school; Special Award by National Institute of Health to attend and present paper at International Congress of Otolaryngology in Tokyo, Japan; Chairman, Department of Otolaryngology, San Francisco General Hospital 1970-76; Chief of Medical Staff, Franklin Hospital 1982-84.

Dr. Tipton and residents examining post-operative patient in recovery room.

“I joined the Army Reserve shortly after completing my responsibilities as Chief of Staff of Franklin Hospital in San Francisco. I was intrigued with the idea of trying something different, such as Army Medicine.

“I find that the challenges and rewards of serving as an Army Reserve physician complement my civilian practice. For a number of years, I’ve been teaching as a member of the Clinical Faculty at the University of California School of Medicine, and I thoroughly enjoy the many teaching opportunities available to me in the Reserve. It is a rewarding experience to be involved in the training of Army medical students, interns, and residents. I also enjoy interacting and exchanging information with full-time Army physicians and seeing a wide variety of interesting clinical cases.

“After 18 years of private practice, I find it stimulating to be able to use my experience and expertise in a totally different medical setting. I highly recommend Army Medicine to any interested physician.”

Find out more about the medical opportunities in the Army Reserve. Call toll free 1-800-USA-ARMY.

**ARMY RESERVE MEDICINE.
BE ALL YOU CAN BE.**

We're putting lives back together.

As a physician you've probably seen it. A family's struggle against alcohol or drugs. A man or woman afraid to ask for help in dealing with depression. A young girl hiding an eating disorder behind a smiling face or popular personality.

At the Carrier Foundation, we work with physicians in treating troubled adolescents and adults. Unlike most general hospitals, all our resources are dedicated to this mission. And have been for more than seventy-five years.

Recognized by all major insurance companies, Carrier is a private, non-profit psychiatric hospital providing both inpatient and outpatient programs. Some of Carrier's specialized programs include: addiction recovery service, adolescent program, affective disorders program, behavioral therapy, eating disorders program, family therapy, geriatric program and women's program.

For more information, call the Carrier Foundation at 1-800-223-0207. The Carrier Foundation. We're putting lives back together.

PHYSICIAN PAYMENT REVIEW COMMISSION

Physician Data Survey

The Physician Payment Review Commission is an advisory body to the U.S. Congress composed of prominent physicians and health policy experts. It was created by Congress in 1986 to make recommen-

dations to reform Part B of Medicare. The Commission is conducting a survey of physicians to obtain data that will be used in the preparation of the Commission's March 1989 report to Congress. We are writing to state and county medical societies, as well as to national specialty societies, to briefly describe this study.

The main purpose of the survey is to obtain data not available from other studies on practice costs, Medicare assignment patterns, the use of certain diagnostic services, and the allocation of physicians' time. The data then will be used to develop recommendations on Medicare reimbursement and other issues. This survey is one of the ways in which physicians will have direct input into the process of reforming the Medicare program.

Westat, Inc., the company selected to perform this study, will contact a random sample of approximately 6,000 physicians and request their participation in this study. Each physician will receive a copy of the survey and an explanation of its purpose. Physicians who respond will have the option of mailing back the completed survey or providing information over the telephone to trained interviewers. We have worked with Westat to minimize the burden of responding to this survey.

AMERICAN BOARD OF MEDICAL SPECIALTIES

FMG Residents Provide Service

A study by Policy Analysis, Inc. as reported in *Hospitals* suggests that FMG residents provide services which would be expensive to replace. The study examined the cost of replacing FMG residents at 15 FMG-dependent teaching hospitals and estimated that it would cost between \$10,000 and \$75,000 per resident to replace them. Residency programs with more than ten physicians of which 25 percent or more are FMGs were so classified. The average hospital surveyed would stand to lose from \$2 million to \$5 million a year in Medicare funds which represent funding for the percent of lost Medicare patient days and the Medicare resident per bed add-on which teaching hospitals receive. The question raised by this study is, of course, whether the residency programs are designed specifically for training or whether this is an additional bit of evidence that residency programs are to provide "cheap" labor in public funded hospitals.

POSITION OF THE AMERICAN MEDICAL ASSOCIATION
Saving Human Life Through Animal Research

Background. The AMA has supported the proper and humane use of animals in research for more than 100 years. The Association opposes legislative and regulatory initiatives that inappropriately would restrict biomedical research.

An estimated 12 to 15 million animals are used each year in research projects. Some 75 percent to 90 percent of those animals are rodents, many used in studies of blood substances, such as hormone production, neurotransmitter regulation, and other substances involved in maintaining homeostasis.

Despite the judicious use of animals in research, many groups of "animal rights" activists urge an end to all scientific investigation that involves animals. Animal welfare and humane societies promote research limitations aimed at reducing the number of animals used, or at exempting certain animals from research projects.

These efforts have resulted in the destruction or termination of many valid investigations. They also have promoted passage of federal and state laws that regulate or restrict the use of animals in research.

Position. The AMA maintains that the loss of biomedical animal research would hamper severely the remarkable growth of knowledge this nation has experienced in recent decades. Medical breakthroughs in diagnosis, treatment, and prevention of heart disease, cancer, diabetes, measles, and many other diseases can be traced directly to the use of animals in research.

Procedures once beyond imagination are commonplace today: open-heart surgery, blood transfusions, organ transplantation, and laser neurosurgery. All were made possible by animal investigations. Crucial to control of the AIDS epidemic will be animals used in research.

While cases of abuse have been documented, the evidence demonstrates that the overwhelming use of animals in investigations complies with federal, state, local, and institutional guidelines, and is conducted with strict compliance to ethical guidelines.

POSITION OF THE AMERICAN MEDICAL ASSOCIATION
Caring for the Needy Elderly

Background. The AMA strongly encourages physicians to accept Medicare's approved payment as payment-in-full for needy beneficiaries. Indeed, the physician acceptance rate in the third quarter of last year was 74.6 percent of claims. Three-fourths of the claims were accepted at Medicare's reimbursement level rather than at the private reimbursement level.

Despite this positive evidence of physician responsibility in caring for the needy elderly, several states have introduced legislation that would force physicians to accept Medicare's reimbursement level as payment-in-full. One state, Massachusetts, has made Medicare mandatory assignment for all beneficiaries a condition of licensure for physicians.

Position. The AMA supports a voluntary program for caring for the needy elderly. The Association has assisted medical societies across the nation in launching such programs. They help beneficiaries locate physicians who will accept assignment, and each program is designed to meet local needs and circumstances. The programs build upon community resources already in place.

AMA data indicate that physicians are responding positively. Since 1982, the percentage of physicians caring for Medicare beneficiaries has climbed 30 percent, from 56 percent to 86 percent. Acceptance of assignment of claims increased from 52.8 percent to 74.6 percent during the same period.

Furthermore, it should be noted that not all elderly are needy. Approximately 12 percent of the elderly lived below the poverty level in 1985, compared with 14 percent of the rest of the population.

Thus, the AMA believes it is unnecessary and unfair to require assignment of all Medicare claims. The more affluent elderly clearly can afford to pay the difference between Medicare reimbursement and the full amount charged to private patients.

**AMERICAN BOARD OF MEDICAL SPECIALTIES
AMA Position on Licensing FMGs**

An AMA policy adopted at the 1988 annual meeting states that "all physicians and medical students should be evaluated for purposes of entry into graduate medical education programs, licensure, and hospital medical staff privileges on the basis of their individual qualifications, skills, and character," and not the country in which the medical school they attended is located (*Health Professions Report*, July 1, 1988).

**AMERICAN MEDICAL ASSOCIATION
Medical Practice Arrangements**

AMA survey data show that physician participation in alternative delivery systems, i.e. HMOs, PPOs, ACCs, is increasing. Growth has been observed in the proportion of physicians having contracts with alternative delivery systems and in the importance of such contracts to physicians' practice revenues. The proportion of physicians choosing to join alternative delivery systems should continue to grow.

POSITION OF THE AMERICAN MEDICAL ASSOCIATION
Assuring an Adequate Supply of Physicians

Background. The AMA supports a wide array of financial aid programs for qualified medical students to assure equal opportunity for all. The high costs of medical education are making it increasingly difficult for any other than the wealthy to gain training. The Association believes that this is not good for the health of the nation.

Right now three major federal loan programs provide financial assistance to medical students: The Health Professions Student Loan (HPSL); Health Education Assistance Loan (HEAL); and Guaranteed Student Loan (GSL) programs. They provide subsidized loans from funds capitalized by the government; federal insurance for market-rate loans; and direct loans at subsidized rates.

The Higher Education Act Amendments of 1986 (P.L. 99-498) assured continued federal support for five years. GSL limits were raised from \$2,500 to \$2,625 for the first two years; from \$2,500 to \$4,000 for the second two years; and from \$5,000 to \$7,500 for postgraduate study. However, now applicants must demonstrate financial need. In addition, deferment provisions are provided for full residency training only for physicians in institution-based programs and not in community-based programs.

Position. The AMA believes that loan deferments should be provided to all medical residents for the duration of their postgraduate training. The deferment should be provided regardless of where or when loans were received, where residency training occurred, or how long the training lasted.

It is not uncommon for medical school tuition to exceed \$10,000 per year. Residents typically are paid modest salaries. Thus, with the large amount of debt usually accumulated, it is financially burdensome for most residents to begin loan repayment before completion of residency training.

AMA Research. Traditionally, physicians have practiced in solo, sole proprietorship, fee-for-service practices. With the emergence of alternative delivery systems and the restructuring of the health care finance system, the traditional motivating forces for entering into a given type of practice arrangement have changed. AMA's Center for Health Policy Research examined these changes by utilizing data generated from the Association's Socioeconomic Monitoring System (SMS) to delineate the changes in physicians' practice arrangements across three dimensions: delivery system—ambulatory care centers (ACC), health maintenance organizations (HMO), and preferred provider organizations (PPO); form of legal organization of the practice; and practice size (in terms of the number of physicians in the practice).

The research was conducted by David W. Emmons, Ph.D. The study focused on the changes in the type of medical practice arrangements being entered into by physicians between the years 1983 and 1986. Some of the factors discussed which may influence how a physician establishes his practice include the legal and financial responsibility that the physician will bear, the capital costs associated with a practice, and access to patient bases.

Research Findings. In general, the research findings document the nature and extent of the change in physicians' practices:

The percentage of physicians receiving revenues from HMOs or IPAs increased from 27.3 percent in 1984 to 34.8 percent in 1986. In addition, the survey indicated that in 1986, 42.2 percent of the physicians had HMO contracts.

Among those receiving IPA or HMO revenues, the proportion of such revenues to total practice revenues also increased. Between 1984 and 1986, the number of physicians who received less than 5.0 percent of their revenues from HMOs dropped from 48.6 percent to 35.3 percent. The number of physicians who re-

ceived more than 10.0 percent from HMOs increased from 3.7 percent to 6.7 percent.

The percentage of physicians with PPO contracts has increased: from 10.9 percent in 1983 to 38.3 percent in 1986. Past numbers regarding this statistic were deceiving, as a measure of physician involvement, due to the frequency with which physicians contracted with a PPO yet did not receive any PPO revenues. This no longer is the case: the percentage of physicians who had contracts with a PPO but received no revenue from the PPO decreased from 26.1 percent in 1984 to 12.4 percent in 1986.

The growth in the percentage of physicians in incorporated practices has been reversed as a result of measures like the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA): the percentage of physicians who were incorporated decreased from 55.3 percent in 1983 to 49.6 percent in 1986. TEFRA eliminated several important tax advantages which previously had been afforded incorporated practices.

Despite the growth in group practice arrangements, and the perception held by some individuals that solo practices are becoming extinct, almost half of those surveyed still are in solo practices: 47.7 percent in 1986.

A number of conclusions is warranted based on the assembled data and its analysis. First, there is increasing physician participation in ACCs, HMOs, and PPOs. In addition, female physicians are playing relatively larger roles in these delivery systems than males. Second, the passage of TEFRA appears to have altered the trend toward incorporated practice. Finally, the shift from solo practice to group practice has stabilized, though the average size of group practices continues to increase.

If you have any questions, please contact: Office of Socioeconomic Research Information, American Medical Association, 535 North Dearborn Street, Chicago, IL 60610.

SINGLE PEOPLE

Total Income Including Social Security	Basic Premium*	Supplemental Income-Based Premium	Total Premium Per Enrollee
\$10,000 or less	\$48	\$0	\$48
\$20,000	\$48	\$180	\$228
\$30,000	\$48	\$405	\$453
\$40,000	\$48	\$720	\$768
\$50,000+	\$48	\$800	\$848

MARRIED COUPLES

Total Income Including Social Security	Basic Premium*	Supplemental Income-Based Premium	Total Premium Per Couple
\$20,000 or less	\$96	\$0	\$96
\$30,000	\$96	\$225	\$321
\$40,000	\$96	\$428	\$524
\$60,000	\$96	\$945	\$1,041
\$80,000	\$96	\$1,575	\$1,671
\$90,000+	\$96	\$1,600	\$1,696

*All enrollees pay the basic premium. Only those with incomes above certain levels pay an income-based "supplemental" premium.

NOTE: AARP estimates that 56% of Medicare enrollees would pay only the basic premium of \$48 per year. Other enrollees would pay the basic premium plus a supplemental premium; 24.4% would pay a total of less than \$250; 7% would pay \$250 to \$500. Only the remaining 12% would pay a total of over \$500 annually.

Source: AARP.

CATASTROPHIC COVERAGE

Medicare

January 1, 1989

■ Medicare provides unlimited hospital coverage after payment of an annual deductible, estimated at \$564 in 1989.

■ Coverage of acute care in skilled nursing home expands from 100 to 150 days a year.

■ Medicare beneficiaries begin paying extra \$4 monthly for catastrophic coverage; amount rises yearly but not expected to exceed \$10.20 by 1993.

Those enrollees who owe taxes will be assessed a 15 percent surtax, up to a maximum of \$800, on each \$150 of federal tax liability for 1989, payable in 1990. Surtax increases annually to 28 percent in 1993, with ceiling of \$1,050.

■ Medicaid starts paying Medicare deductibles, premiums, and coinsurance for those with incomes up to 85 percent of federal poverty level, gradually rising to 100 percent in 1992.

September 30, 1989

■ Spouses of Medicaid nursing home residents may now keep \$786 in monthly income and \$12,000 or half the couple's assets, whichever is greater. Monthly income allowance increases yearly until it reaches about \$950 a month in 1992.

January 1, 1990

■ The maximum a person would have to pay out of pocket for Part B physician services becomes \$1,370 a year.

■ Annual coverage for home health services increases

from 15 days to 38 days. Also, Medicare pays for health aides to provide up to 80 hours of respite care for relatives attending to patients at home.

January 1, 1991

■ Medicare starts paying 50 percent of outpatient prescription drug expenses exceeding \$600 a year. This share increases to 60 percent in 1992, 80 percent in 1993.

EDITOR'S COMMENT

The Right Question

We should be pleased that a legislator, particularly one as eminent as Chuck Hardwick, has focused on the "right question," a question that has not been given enough attention by others, including most of us in medicine (page 1035). Why should other groups, like the tobacco industry and Chrysler Corporation, be entitled to kudos for economic growth and to governmental subsidies when our health care system, the best in the world and one that has had the fat wrung out of it, continues to suffer from increasing governmental regulation and opprobrium? A sneaking suspicion is that the pursuit of pleasure is more rewarding than the rendering of service. (Howard D. Slobodien, M.D., Editor-in-Chief, *NEW JERSEY MEDICINE*)

A new non-surgical procedure, called gallstone lithotripsy, uses shock waves to reduce gallstones to sand-like particles, which can then be passed or dissolved. Compared to surgery, this treatment is less painful and less costly and can allow your patient to return to work in a few days.

Penn Medical Center, one of the nation's premier academic medical centers and a pioneer in kidney stone lithotripsy, was among the first 10 hospitals nationwide authorized to use the Dornier gallstone lithotripter as part of an FDA-approved study to test the safety and efficacy of the procedure. The procedures that we refine through our research will eventually become part of gallstone treatment options at hospitals across the country.

At Penn's Gallstone Evaluation and Treatment Center, a comprehensive and multidisciplinary program, the full range of gallstone treatment options are available. Our gastroenterologists, radiologists and surgeons can determine whether *Lithotripsy, Oral Medication, Interventional Radiology, or Surgery* is the best treatment option for your patient.

Forced Medicare Bill Stays Put; Malpractice Surcharge: To the Courts?

FORCED MEDICARE BILL STAYS PUT

Big victories can come in small packages. That's the case with the Society's latest triumph over A-2305, the forced Medicare bill.

After an Assembly debate which lasted fewer than five minutes—too short to be reported in the newspapers—Assemblyman Alan Karcher failed in his October 27 attempt to relieve the Health Committee of A-2305. Had the effort succeeded, the bill would be in position for a floor vote.

Intensive grassroots lobbying and face-to-face contacts with legislators in Trenton produced results. The brevity of the debate reflected that Mr. Karcher had fallen short of the 41 votes he needed to pry the bill out of committee.

The Assembly action consisted of Mr. Karcher's moving to relieve the Committee, followed by a rebuttal from Committee Chairman Harold Colburn. Majority Leader Chuck Haytaian then moved to table Karcher's motion—a parliamentary procedure which shuts off debate and requires an immediate vote.

The motion to table carried by a vote of 40 "yes," 26 "no," and 12 abstentions. A number of the 26 assemblymen who voted against tabling had told us privately that they will oppose forced Medicare if the bill itself is ever brought to a floor vote.

Assemblyman Karcher set the stage for our battle against A-2305 in a Trenton press conference a week prior to the October 27 debate.

Speaking to some 150 senior citizens at the conference, Mr. Karcher, who has announced that he will run for governor next year, said, "While Medicare is designed to remove a tremendous health care cost shouldered by the elderly, recipients still have to pay billions of dollars every year to physicians who charge

over and above Medicare assignment. It's time for this overcharging to cease."

Saying that his bill has been "languishing" in the Health Committee ever since it was introduced last January, Mr. Karcher told the seniors, "We have the power together to do this. Find out who represents you and call them on the phone and tell them how you feel."

"The health care cost system has been permeated by gross inequities. While senior citizens' income has remained at levels ranging from \$6,000 to \$11,000 per year, medical costs have been rising at two to three times the rate of general inflation. This bill would ensure that the elderly who need care will be able to afford it through the Medicare system. Delay of legislative action is inexcusable."

The press conference was organized by United Senior Action, an East Windsor-based umbrella organization which draws support from a number of labor unions and senior groups throughout the state.

The coalition's president, Joe Riordan, issued an inflammatory press release which railed against "the raw display of political muscle of the medical profession when they (sic) announced that they raised \$196,000 to kill this bill and to move against Assemblyman Karcher when he runs for reelection." (Mr. Riordan's reference is to medicine's political contributions in the 1987 legislative elections. Support was given to Democrats and Republicans in both houses, and never was directed against Assemblyman Karcher.)

"There are times when one has to wonder if some doctors ever had parents," said Riordan.

United Senior Action said it would present Governor Kean and legislative leaders with petitions signed by 10,000 seniors supporting forced Medicare. The coalition also announced plans for a future mass demonstration in support of the bill.

The coalition claims that the forced Medicare law has not hurt physicians in Massachusetts. As proof, it says that the number of physicians practicing there has increased from 16,550 in 1984 to 22,250 today.

(The Massachusetts Medical Society (MMS), however, points out that the current number of licenses does not take into account physicians who are inactive, retired, deceased, or practicing in other states. MMS says that only about 70 percent of the licenses are held by physicians actively practicing in the state.)

Despite the outcome of the Assembly debate, forced Medicare obviously will remain a volatile issue. With that in mind, it is important for physicians throughout the state to know where their assemblymen stand on A-2305.

Following is a breakdown of the vote on the "motion to table." When the vote was recorded, 2 of the 40 legislators who voted "yes" had changed to abstentions. For our purposes, an abstention is as good as a "yes." Bear in mind that not all 26 of the assemblymen who voted against the motion are supporters of A-2305.

Absent: Naples (D-Trenton), and Watson (D-Trenton).

MALPRACTICE SURCHARGE: TO THE COURTS?

If the Society's campaign against the Insurance Department's proposed surcharge on malpractice premiums ends up in the courts, its cause will be well-served by testimony presented at an October 24 hearing in Trenton.

Some 150 physicians from across the state crowded an Insurance Department hearing room in an impressive display of opposition to the 5 percent annual surcharge proposed by the Department to make good a \$60 million debt run up by the Medical Malpractice Reinsurance Association. The Association, established by the state in 1976, sold underpriced malpractice insurance to 3,300 physicians and 450 podiatrists for six years.

Although the Association acted when it realized its rates were unsound in 1977, the requested 41.4 percent rate hike was rejected by then-Commissioner James Sheeran.

The Association, deactivated in 1982, currently holds \$22 million in reserves, but faces an estimated

\$82 million in claims over the next decade. The proposed surcharge would raise about \$9.15 million a year.

Testimony at the hearing focused on two issues: Is the surcharge legal, and is it fair?

On the question of legality, Hearing Officer Holly Bakke admitted that the law which created the Medical Malpractice Reinsurance Association is "extraordinarily vague" about whom should be surcharged to make up a deficit.

The law authorizes the insurance commissioner to "establish reasonable provisions through additional premium charges" in order to provide "an amount sufficient to meet the requirements of this act."

But the law also says the Association is to recoup its losses "through surcharges on *insureds*" (emphasis added).

Physicians who testified at the hearing—many of them directors of the Medical Inter-Insurance Exchange of New Jersey—reviewed the legislative history of the malpractice reinsurance law, pointed out that the Association was supposed to be activated only if malpractice insurance was not "readily available," underscored the Department's rejection of the requested rate hike, and spoke from the heart about the unfairness of surcharging physicians who did not purchase the Association's "bargain" insurance.

Said Society President Palma E. Formica, M.D., "The commissioner of insurance, representing the very agency that charged less and lost more, now is suggesting that physicians who were prudent and diligent in seeking a sound insurance vehicle should pay to vindicate those that took the easy way, at the request and urging of the state.

"Surely it is also unfair to ask doctors who were not even present in the state when these losses were incurred, or in practice at that time, to pay this debt. It is unfair to require the physicians not yet licensed to pay this debt. It is irresponsible to permit those that received the benefit which caused the loss to avoid the responsibility."

No organization testified in favor of the surcharge at the public hearing, but the American Insurance Association (AIA) submitted a supportive statement for the record. Possibly because the hearing record was so heavily weighted with the physician's viewpoint, the Insurance Department subsequently took an extraordinary step: it extended for one month the time for written comments to be submitted.

The AIA statement reads, in part, "The commissioner has developed a regulation that assesses insurance on the broadest possible basis, i.e. all physicians. The basis for this assessment is consistent not only with the legislation, but with the basic principle of insurance, i.e. that a risk be spread among the largest number of people."

YOCON[®]

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon[®] is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon[®] 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

LEVOXINE®

(LEVOTHYROXINE SODIUM TABLETS, USP)

FOR ORAL ADMINISTRATION

DESCRIPTION:

Each LEVOXINE (Levothyroxine Sodium, USP) tablet contains synthetic crystalline levothyroxine sodium (L-thyroxine). L-thyroxine is the principal hormone secreted by the normal thyroid gland. Chemically, L-thyroxine is designated as L-tyrosine, O-(4-hydroxy-3, 5-diiodophenyl) - 3,5-diiodo-... monosodium salt, hydrate. The molecular formula is $C_{15}H_{10}I_4NNa$ and the structural formula is:

CLINICAL PHARMACOLOGY:

The principal effect of thyroid hormones is to increase the metabolic rate of body tissues.

The thyroid hormones are also concerned with growth and development of tissues in the young.

The major thyroid hormones are L-thyroxine (T_4) and L-triiodothyronine (T_3). The amounts of T_4 and T_3 released from the normally functioning thyroid gland are regulated by the amount of thyrotropin (TSH) secreted from the anterior pituitary gland. T_4 is the major component of normal thyroid gland excretions and is therefore the primary determinant of normal thyroid functions. T_4 acts as a substrate for physiologic deiodination to T_3 in the peripheral tissues. The physiologic effects of thyroid hormones are mediated at the cellular level primarily by T_3 .

LEVOXINE (L-thyroxine) tablets taken orally provide T_4 which upon absorption can not be distinguished from T_4 that is secreted endogenously.

INDICATIONS AND USAGE:

LEVOXINE (L-thyroxine) tablets are indicated as replacement or supplemental therapy for diminished or absent thyroid function (e.g., cretinism, myxedema, nontoxic goiter or hypothyroidism generally, including the hypothyroid state in children, in pregnancy and in the elderly) resulting from functional deficiency, primary atrophy, from partial or complete absence of the gland or from the effects of surgery, radiation or antithyroid agents. Therapy must be maintained continuously to control the symptoms of hypothyroidism.

CONTRAINDICATIONS:

L-thyroxine therapy is contraindicated in thyrotoxicosis, acute myocardial infarction and uncorrected adrenal insufficiency.

WARNINGS:

Drugs with thyroid hormone activity, alone or together with other therapeutic agents, have been used for the treatment of obesity. In euthyroid patients, doses within the range of daily hormonal requirements are ineffective for weight reduction. Larger doses may produce serious or even life-threatening manifestations of toxicity, particularly when given in association with sympathomimetic amines such as those used for the anorectic effects.

PRECAUTIONS:

General — Caution must be exercised in the administration of this drug to patients with cardiovascular disease. Development of chest pains or other aggravation of the cardiovascular disease requires a reduction of dosage.

Information For The Patient — Patients on thyroid preparations and parents of children on thyroid therapy should be informed that:

1. Replacement therapy is to be taken essentially for life, with the exception of cases of transient hypothyroidism, usually associated with thyroiditis, and in those patients receiving a therapeutic trial of the drug.
2. They should immediately report during the course of therapy any signs or symptoms of thyroid hormone toxicity, e.g., chest pain, increased pulse rate, palpitations, excessive sweating, heat intolerance, nervousness, or any other unusual event.
3. In case of concomitant diabetes mellitus, the daily dosage of antidiabetic medication may need readjustment as thyroid hormone replacement is achieved. If thyroid medication is stopped, a downward readjustment of the dosage of insulin or oral hypoglycemic agent may be necessary to avoid hypoglycemia. At all times, close monitoring of urinary glucose levels is mandatory in such patients.
4. In case of concomitant oral anticoagulant therapy, the prothrombin time should be measured frequently to determine if the dosage of oral anticoagulants is to be readjusted.
5. Partial loss of hair may be experienced by children in the first few months of thyroid therapy, but this is usually a transient phenomenon and later recovery is usually the rule.

Laboratory Tests — The patient's response to thyroid replacement may be followed by laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels.

Drug Interactions — In patients with diabetes mellitus, addition of thyroid hormone therapy may cause an increase in the required dosage of insulin or oral hypoglycemic agents. Therefore, patients with diabetes mellitus should be observed closely for possible changes in antidiabetic drug dosage requirements.

Patients stabilized on oral anticoagulants who are found to require thyroid replacement therapy should be watched very closely when therapy is started. If a patient is truly hypothyroid, it is likely that a reduction in anticoagulant dosage will be required. No special precautions appear to be necessary when oral anticoagulant therapy is begun in a patient already stabilized on maintenance thyroid replacement therapy.

Cholestyramine binds both T_4 and T_3 in the intestine, thus impairing absorption of these thyroid hormones. In vitro studies indicate that the binding is not easily removed. Therefore, four to five hours should elapse between administration of cholestyramine and thyroid hormones.

Estrogens tend to increase serum thyroxine-binding globulin (TBG). In a patient with a non-functioning thyroid gland who is receiving thyroid replacement therapy, free thyroxine may be decreased when estrogens are started thus increasing thyroid requirements. However, if the patient's thyroid gland has sufficient function the decreased free thyroxine will result in a compensatory increase in thyroxine output by the thyroid. Therefore, patients without a functioning thyroid gland who are on thyroid replacement therapy may need to increase their thyroid dose if estrogens or estrogen containing oral contraceptives are given.

Drug/Laboratory Test Interactions — The following drugs or moieties are known to interfere with laboratory tests performed on patients taking thyroid hormone: androgens, corticosteroids, estrogens, oral contraceptives containing estrogens, iodine-containing preparations, and the numerous preparations containing salicylates.

1. Changes in TBG concentration should be taken into consideration in the interpretation of T_4 and T_3 values. In such cases, the unbound (free) hormone should be measured. Pregnancy, estrogens, and estrogen-containing oral contraceptives increase TBG concentrations. TBG may also be increased during infectious hepatitis. Decreases in TBG concentrations are observed in nephrosis, acromegaly, and after androgen or corticosteroid therapy. Familial hyper- or hypo-thyroxine-binding-globulinemias have been described. The incidence of TBG deficiency approximates 1 in 9000. The binding of thyroxine by thyroid-binding prealbumin (TBPA) is inhibited by salicylates.
2. Medical or dietary iodine interferes with all in vivo tests of radio-iodine uptake, producing low uptakes which may not be reflective of a true decrease in hormone synthesis.
3. The persistence of clinical and laboratory evidence of hypothyroidism in spite of adequate dosage replacement indicates either poor patient compliance, poor absorption, excessive fecal loss, or inactivity of the preparation. Intracellular resistance to thyroid hormone is quite rare.

Carcinogenesis, Mutagenesis, And Impairment

Of Fertility — A reportedly apparent association between prolonged thyroid therapy and breast cancer has not been confirmed and patients on thyroid for established indications should not discontinue therapy. No confirmatory long-term studies in animals have been performed to evaluate carcinogenic potential, mutagenicity, or impairment of fertility in either males or females.

Pregnancy — Category A — Thyroid hormones do not readily cross the placental barrier. The clinical experience to date does not indicate any adverse effect on fetuses when thyroid hormones are administered to pregnant women. On the basis of current knowledge, thyroid replacement therapy to hypothyroid women should not be discontinued during pregnancy.

Nursing Mothers — Minimal amounts of thyroid hormones are excreted in human milk. Thyroid is not associated with serious adverse reactions and does not have a known tumorigenic potential. However, caution should be exercised when thyroid is administered to a nursing woman.

Pediatric Use — Pregnant mothers provide little or no thyroid hormone to the fetus. The incidence of congenital hypothyroidism is relatively high (1:4,000) and the hypothyroid fetus would not derive any benefit from the small amounts of hormone crossing the placental barrier. Routine determinations of serum (T_4) and/or TSH is strongly advised in neonates in view of the deleterious effects of thyroid deficiency on growth and development.

Treatment should be initiated immediately upon diagnosis, and maintained for life, unless transient hypothyroidism is suspected; in which case, therapy may be interrupted for 2 to 8 weeks after the age of 3 years to reassess the condition. Cessation of therapy is justified in patients who have maintained a normal TSH during those 2 to 8 weeks.

ADVERSE REACTIONS:

Adverse reactions are due to overdosage and are those of induced hyperthyroidism.

OVERDOSAGE — Excessive dosage of thyroid medication may result in symptoms of hyperthyroidism. Since, however, the effects do not appear at once, the symptoms may not appear for one to three weeks after the dosage regimen is begun. The most common signs and symptoms of overdosage are weight loss, palpitation, nervousness, diarrhea or abdominal cramps, sweating, tachycardia, cardiac arrhythmias, angina pectoris, tremors, headache, insomnia, intolerance to heat and fever. If symptoms of overdosage appear, discontinue medication for several days and reinstitute treatment at a lower dosage level.

Laboratory tests such as serum T_4 , serum T_3 and the free thyroxine index will be elevated during the period of overdosage.

Complications as a result of the induced hypermetabolic state may include cardiac failure and death due to arrhythmia or failure.

TREATMENT OF OVERDOSAGE — Dosage should be reduced or therapy temporarily discontinued if signs and symptoms of overdosage appear. Treatment may be reinstituted at a lower dosage. In normal individuals, normal hypothalamic-pituitary-thyroid axis function is restored in 6 to 8 weeks after thyroid suppression.

Treatment of acute massive thyroid hormone overdosage is aimed at reducing gastrointestinal absorption of the drugs and counteracting central and peripheral effects, mainly those of increased sympathetic activity. Vomiting may be induced initially to further gastrointestinal absorption can reasonably be prevented and barring contraindications such as coma, convulsions, or loss of the gagging reflex. Treatment is symptomatic and supportive. Oxygen may be administered and ventilation maintained. Cardiac glycosides may be indicated if congestive heart failure develops. Measures to control fever, hypoglycemia, or fluid loss should be instituted if needed. Antiadrenergic agents, particularly propranolol, have been used advantageously in the treatment of increased sympathetic activity. Propranolol may be administered intravenously at a dosage of 1 to 3 mg over a 10 minute period orally, 80 to 160 mg/day, especially when no contraindications exist for its use.

DOSAGE AND ADMINISTRATION:

The goal of therapy should be the restoration of euthyroidism as judged by clinical response and confirmed by appropriate laboratory tests such as serum thyroxine (T_4), serum triiodothyronine (T_3), free thyroxine index and thyroid stimulating hormone (TSH) blood levels. The age and general condition of the patient and the severity and duration of hypothyroid symptoms determine the starting dosage and the rate of incremental dosage increase leading to a final maintenance dosage.

In otherwise healthy adults, the recommended initial dose is 25 to 100 mcg (0.025 to 0.1 mg) daily, while the predicted full maintenance dose of 100 to 200 mcg (0.1 to 0.2 mg) daily may be achieved in two to three weeks.

In the elderly patient with long standing disease, evidence of myxedema, or evidence of cardiovascular dysfunction, the initial dose may be as little as 12½ mcg (0.0125 mg) per day. Incremental increases of 25 mcg (0.025 mg) per day at 3 to 4 week intervals may be instituted depending on patient response. It is the physician's judgement of the severity of the disease and close observation of patient response which determine the rate and extent of dosage increase.

In infants and children there is a great urgency to achieve full thyroid replacement because of the critical importance of thyroid hormone in sustaining growth and maturation. Despite the smaller body size, the dosage needed to sustain a full rate of growth, development and general thriving is higher in the child than in the adult. The recommended daily replacement dosage of L-thyroxine in childhood is: 0-1 years: 5-6 mcg/kg; 1-5 years: 3-5 mcg/kg; 6-12 years: 4-5 mcg/kg of body weight daily.

DOSAGE FORMS AVAILABLE:

LEVOXINE (L-thyroxine) tablets are supplied as oval, color-coded, potency marked tablets in eleven strengths: 12½ mcg (0.0125 mg)—maroon, 25 mcg (0.025 mg)—orange, 50 mcg (0.05 mg)—white, 75 mcg (0.075 mg)—purple, 100 mcg (0.1 mg)—yellow, 112 mcg (0.112 mg)—rose, 125 mcg (0.125 mg)—brown, 150 mcg (0.15 mg)—blue, 175 mcg (0.175 mg)—turquoise, 200 mcg (0.2 mg)—pink and 300 mcg (0.3 mg)—green, in bottles of 100, 1000, unit dose cartons of 100 (10 strips of 10 each), and 500 mcg injectable (See injectable package insert).

Levoxine[®]

(Levothyroxine Sodium Tablets, USP)

NOW FOR MORE PRECISE DOSING
NEW 12½ mcg

**Finally, a bioequivalent replacement
for Synthroid[®]
that's reasonably priced.**

Introducing Levoxine from Daniels Pharmaceuticals — a breakthrough in quality manufactured Levothyroxine Sodium Tablets, USP. Levoxine is now available in a 12½ mcg tablet for more precise dosing.

Randomized crossover studies comparing the bioequivalency of Levoxine tablets to Synthroid tablets showed no significant difference in thyroxine (T₄), triiodothyronine (T₃) or free thyroxine index (T_f).

Levoxine is available in eleven color-coded strengths to assure prescription compliance and patient acceptance. Each strength is put through extensive quality control measures to ensure the highest quality. Prescribe Levoxine, and give your patients exactly what they need at a price that's more affordable.

Reducing Malpractice Claims

Vacation Coverage Tips; Physician Insurers Float New Proposal for Fault-Based Alternative System

VACATION COVERAGE TIPS

Pre-vacation arrangements for practice coverage are vital to assure trouble-free continuation of optimal medical care to your patients in your absence. Coverage plans that are complete and well thought out, coupled with good communication with the covering physician and your patients, will help to guarantee that your patients' needs are being met adequately.

In selecting a physician to cover your practice, try to find a physician in your specialty whose treatment philosophies are compatible with your own. A longtime patient will be comfortable with your methods and treatment style, and any radical departure or change from this by a covering physician may be met with resistance and noncompliance on the part of your patient. It is important that the physician covering your practice is aware of all aspects of coverage prior to your departure—your expectations, your needs and those of your patients, "on-call" duties, emergency coverage, answering service information, and in-hospital patient requirements. Additionally, confirm that the physician providing your vacation coverage has professional liability insurance applicable to this locum tenens activity.

In its routine review of cases, the Pennsylvania Medical Society Liability Insurance Company's Claims Committee continues to see problems develop because of flaws in a physician's vacation coverage, especially with regard to in-hospital practice. It often is wise to postpone elective surgical procedures until your return, rather than have a covering physician be required to step in during the immediate postoperative period. Inform the patient of your vacation plans so

that he knows you will not be available for the entire postoperative course before his decision regarding the date of elective surgery. If you have surgical patients in the hospital at the time you begin your leave, relaying information on the care of these patients especially is important. Make sure your covering physician is aware of postoperative patients' needs with regard to dressings, drains, physical therapy, suture removal, and allergies.

If you receive a consult request prior to your departure, make sure someone will followup in your absence, especially on surgical consults. The Pennsylvania Medical Society Liability Insurance Company has seen malpractice cases arise out of communication breakdowns in the consultation process. For example: you are called in as a surgical consultant on a patient in acute abdominal pain; you decide that the patient is not a candidate for surgery at that time; note your findings and impressions to that effect in the patient's chart; and then leave for vacation. Prior to leaving, you, as the consultant, have to be sure that the attending physician who requested the consult is aware of its results, is aware that you are going on vacation, and is aware of the physician covering the practice in your absence. Additionally, it is important that the covering physician is aware of the consult and can followup should the patient's condition worsen or require re-evaluation. Effective communication between all parties involved is essential to the success of any consultation.

Give your patients advance notice of your plans to be away and let them know who will be taking care of them in your absence. When possible, introduce your replacement to them and express your confidence in his competence and ability to meet their medical needs while you are away.

Make sure your answering service received complete instructions regarding your absence and your coverage arrangements. Patients who call should be informed of your absence, who is covering your practice, and how to reach your replacement easily. Having the answering service keep a written log of all patient calls may be helpful to you for postvacation followup.

On your return, get a complete report from the covering physician regarding what transpired with your practice and your patients while you were away. Additionally, try to get feedback from your patients regarding their experiences with your replacement. If there were any problems or patient dissatisfaction, these should be discussed with the patients and the covering physician immediately to help your next absence go more smoothly.

Taking the time to work out practice coverage details before you leave will help make your vacation less traumatic for all concerned—you, your patients, your covering physician, your colleagues, and your staff—and will help ensure the continued delivery of optimal patient care. (Pennsylvania Medical Society Liability Insurance Company, *Patient Rx Newsletter*, Volume 10, No. 4, July 1988.)

*This item from the Department of Professional Liability Control, MSNJ, was prepared by James E. George, M.D., J.D., and A. Ronald Rouse, who are Director of the Department and Director of Special Projects.

PHYSICIAN INSURERS FLOAT NEW PROPOSAL FOR FAULT-BASED ALTERNATIVE SYSTEM

The conceptual framework for a new plan for resolving medical malpractice claims was unveiled at the annual meeting of the Physician Insurers Association of America (PIAA) in San Diego. The proposal, which a committee of PIAA is refining, combines a fault-based administrative system for determining fault with a fixed schedule of benefits.

Modeled in some respects after workers' compensation programs, the plan envisioned would offer incentives to encourage plaintiffs to resolve claims through an optional administrative system rather than the courts. A three-person commission, composed of a judge, physician, and layperson, would be appointed by a state's governor to handle determinations of fault. The commission would have rule-making power and would function much as do screening panels already operating in a number of states.

All medical costs, including rehabilitation and rehabilitation services, would be paid without limitation. Wage losses would be computed as a function of the plaintiff's actual wage loss, but with a cap based on some multiple of the average weekly wage in the state. All these costs would be paid as incurred, and all would be subject to a collateral source offset.

All awards for noneconomic damages would be paid according to a fixed schedule of benefits, again following the workers' compensation model.

There would be a set base amount for permanent total disability, from which payments for other injuries and losses would be calculated on a percentage basis.

Although the plan would impose some restrictions on attorneys' contingency fees, it also would provide for part payment to attorneys who use the administrative system even when a case is lost.

A PIAA legal counsel said one of four basic principles that the association's committee to study alternatives to the present system wanted to incorporate in any proposal was that attorneys' fees bear a closer relationship to the actual work involved on a case.

"Attorneys should be primarily paid on the basis of their time," the PIAA attorney said. "However, as an incentive for selection of the administrative system for determining liability, we would propose that at least for those who select the system, that attorneys' fees be paid over and above the other elements of loss."

"Most controversial is our proposal that if cases with some reasonable basis come through the administrative system and are lost, that some portion of attorney's fees be paid. Attorneys might be paid one-third of their reasonable number of hours in these cases," the PIAA attorney said.

This provision counters arguments for the contingency fee system from plaintiffs' attorneys who say they take many cases for which they are paid nothing.

"We also believe some element for pain and suffering should be included in the plan," the PIAA attorney said. "We did not feel it was politically feasible, and perhaps neither constitutional nor fair, to eliminate such payments entirely."

The purpose of a fixed benefit schedule was to design a system providing for "fair, quick, uniform com-

pensation," the PIAA attorney said. "Certainly there should be some savings, but not necessarily drastically reduced awards across the board. The principal goal is to establish some uniformity in the process of resolving claims and get a handle on the trend for future cost increases."

Comparisons of the PIAA proposal now being developed with the alternative system introduced by the American Medical Association and 32 national medical specialty societies last January were inevitable during the session at which the work of the PIAA Alternatives Committee was reported. The AMA plan, which would move claims resolution out of the courts to an administrative body—either an existing, expanded state board of medical examiners or a separate entity—also calls for a tougher, escape-proof net for identifying, disciplining and/or sidelining negligent physicians.

The Committee chairman, legal counsel for Pennsylvania Medical Society Liability Insurance Company, praised the AMA plan as innovative and one that should operate faster and less expensively, and should bring some uniformity and predictability to the claims resolution process. She also commended the provisions calling for risk management and quality assurance as "novel" and appropriate.

The PIAA Alternatives Committee did express concerns about some provisions in the AMA plan. Said the chairman, "The various levels of appeal associated with the step-by-step process could cause it to bog down. However, the dual function—performance of both disciplinary and claims resolution by a single entity—is most troubling in many ways."

Program costs eventually could be passed along to medical malpractice insurers and health care providers, "making it very expensive to a small group of people," the chairman said.

The senior attorney in the AMA Office of the General Counsel and coordinator of the special task force on professional liability and insurance, said that AMA's program offer states two options: creation of a separate administrative agency or expansion of the existing medical licensing board to handle claims.

"Virtually every state I have talked to is interested in establishing a separate agency," the attorney said. "The dual function may appeal to some medical boards, but it certainly does not appeal to many medical societies."

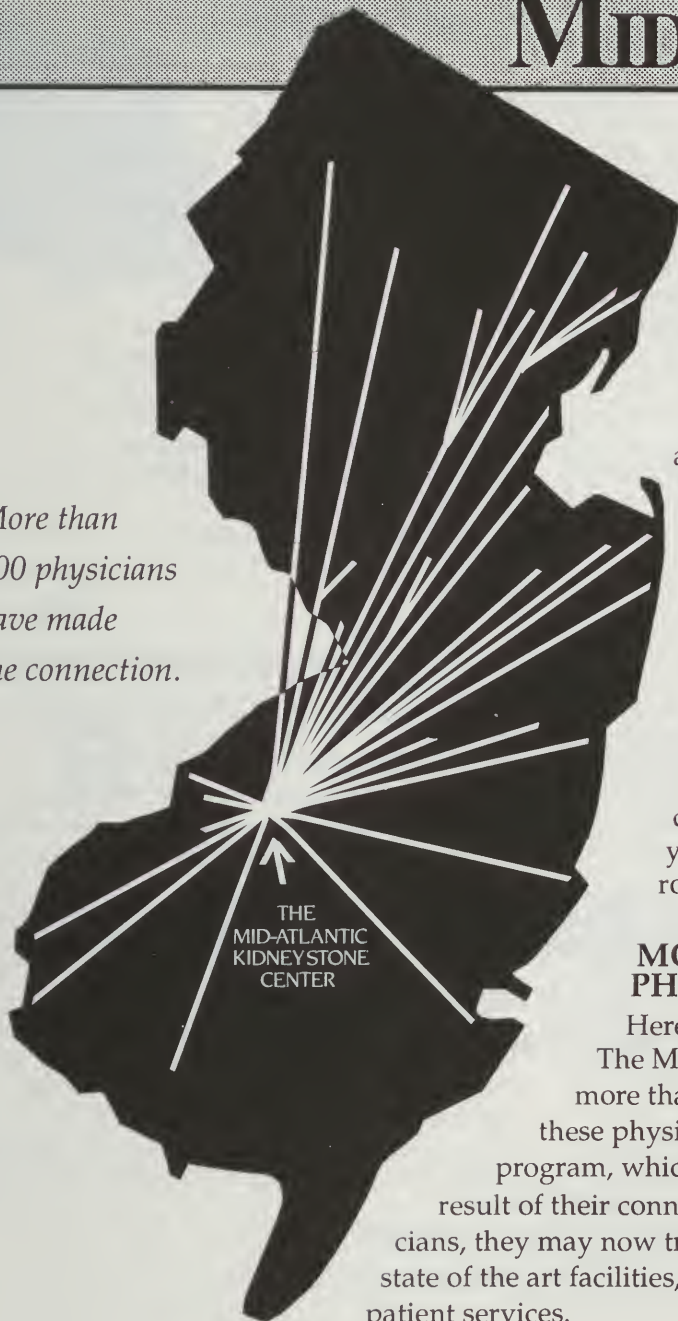

The attorney said that the AMA/specialty society program continues to be refined. Several states are considering taking the proposal to their legislatures, Utah in particular.

The chairman of the committee to study alternatives said it is encouraging that several different solutions are being proposed and may be tested. The PIAA legal counsel noted the AMA and PIAA's proposals were similar in many respects and shared the same goals.

The PIAA proposal has not been formally endorsed by the alternatives committee or the organization's board. It should be finalized later in the year when the committee, chaired by Peter Sweetland, president, Medical Inter-Insurance Exchange of New Jersey, issues its final report. (*Medical Liability Monitor*, Vol. 13, Number 6, June 17, 1988)

EXPERIENCE & MID-ATLANTIC

*More than
100 physicians
have made
the connection.*

For physicians throughout New Jersey and from as far away as eastern Pennsylvania, metropolitan New York and Delaware, *Mid-Atlantic* is synonymous with *experience*. Consider the following: we recently treated our 4,000th patient, a milestone for lithotripter units in the eastern region. Reading between the numbers, we see an unparalleled depth of experience that enables us to deliver the clinical excellence and full-service support you demand.

Additionally, we recently celebrated our third year of operation. Through this experience we have developed a unique sensitivity to your patients, your concerns and the role that we play as a service to both.

MORE THAN 100 STAFF PHYSICIANS AND GROWING

Here's another fact we're proud of: The Mid-Atlantic Kidney Stone Center has more than 100 physicians on staff. Many of these physicians learned lithotripsy through our program, which is now AUA and ALS certified. As a result of their connection to Mid-Atlantic as staff physicians, they may now treat their patients here, enjoying our state of the art facilities, full support staff and comprehensive patient services.

MAKE THE CONNECTION TODAY

Mid-Atlantic's experience is yours for the asking. To find out more about Mid-Atlantic's services and our physician training program, call us at 1-800-53-LITHO or (609) 983-7337.

Gift Giving

PALMA E. FORMICA, M.D.*

Happy holidays! In this season of giving and expressing wishes for good health, happiness, and

hope for the new year, I take this opportunity to thank you for the many gifts, as physicians, you give to the people of New Jersey.

To the thousands of you who serve the poor and the disadvantaged, a heartfelt thanks. Every time you see a Medicaid patient or accept assignment, you give a special gift of caring—of time and money. Government officials and some senior citizens forget that accepting assignment is a gift from each of you. What other segment of this nation gives so much, yet is acknowledged so little. Every time you treat a "service" patient in the hospital, you alone are uncompensated for the time, effort, and caring. Still, you do it because you are a physician.

How many hours have been given to hospital committees for peer review, quality assurance programs, educational seminars, and other committees to make the hospital environment a better place? Financial contributions for building projects and fundraising activities are supported by staff members. Does anyone remember to say "thank you"?

Your gift of friendship and support is most meaningful to our colleagues who are struggling with impairment. The first evidence of your love and concern comes by helping the afflicted physician face reality and by assisting in efforts for rehabilitation. Thank you for supporting the "Adopt a Family Program" which helps our own through bleak financial times. Each physician who has made it back to wellness is a testimony to each of you. I am overwhelmed by the generosity of service of the recovering. For this gift of love, I salute you.

Your efforts on behalf of clean air, safe shores and highways, toxic wastes, nuclear power hazards, and environmental protection predated the political bandwagon. Your actions and commitment for change led the way, even when the issues were not popular. We thank each of you for your advocacy for the health of the state.

Who led the way in the fight against AIDS in treatment and research? You, the doctors of this state responded with compassion and in a manner worthy of the highest ideals of the profession. For this gift, we thank you.

In hundreds of ways, doctors are involved in promoting cultural activities of the visual and performing arts as supporters and patrons. These, too, are gifts of service. What church, synagogue, or temple does not call upon the service and involvement of its physicians? The gifts physicians give are legion. We have all benefited from your involvement. You are the support and underpinning which makes our dedication meaningful and worthwhile.

For these many gifts, the Medical Society of New Jersey is grateful and proud. Giving is 365 days a year.

May you enjoy the rewards of your gifts by knowing you made a difference.

**“A big insurance company
that’s really listening to me?”**

**I don’t
believe it.”**

Believe it! Medallion. From Blue Cross and Blue Shield.

We listened to you because we all share a common concern—the welfare of your patients.

After listening to your needs, we've developed the best insurance for a healthy practice...and your patients.

The result is Medallion.

Comprehensive fee-for-service.

The fee-for-service insurance program you want, with comprehensive medical coverage your patients need. Including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. And, once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

Patient referral.

Our Blue Cross and Blue Shield referrals can help build your practice. Over 40,000 prospective patients will call us this year, asking about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you.

Superior programs like Medallion are proof that Blue Cross and Blue Shield is responding to the changing needs of New Jersey's medical professionals, and offering advantages to the more than 10,000 physicians throughout the state who participate in the Blue Cross and Blue Shield network.

If you're not yet a participating physician with Blue Cross and Blue Shield, why not find out how we can help your practice. Just call 1-800-842-BLUE for more information. Of course, there's no obligation.

The best insurance for a healthy practice.

About Nurses and Nursing

HOWARD D. SLOBODIEN, M.D.*

The relationship between physicians and nurses in recent years has been far from ideal, despite the obvious need for the two professions to work as a team in the delivery of patient care.

Many reasons for this schism can be cited. Nurses have expressed resentment at the attitude of physicians toward them—as second class citizens in treating patients. They also have resented physician “interference” in the determination of the proper education needed to produce a fully qualified nurse, whether it should involve two, three, or four years of training.

On the other hand, physicians have expressed repeatedly the dicta, “If you want to be a physician, go to medical school. There can be only one captain of the ship.” We also have suggested that baccalaureate degreed nurses have shown a firm grasp of theory, but have not demonstrated equivalent clinical skills.

The present, and continuing, shortage of nurses has compounded the problem. As a partial answer, the AMA has proposed the establishment of a new category

of health care worker, the registered care technologist. What a furor this has raised! The registered nurse (RN) thinks it is inappropriate, unwise, and dangerous. The licensed nurse practitioner (LPN), faced with a trend by some hospitals toward all RN staffs, also considers it imprudent, but also worries even more about the job. Both of these groups also feel this type of practitioner would be performing nursing duties and that the training program should be run by nurses, not by physicians, although appropriate physician input would be welcomed.

Physicians in New Jersey probably have had a better relationship with nurses than have those in other states. New Jersey has been the only state not to license physician assistants (PAs) and physicians have been joined by nurses in maintaining opposition to the PA. Perhaps this common effort can continue as we try to insure proper care for our patients.

The Medical Society of New Jersey Task Force on the Shortage of Nurses and Technical Personnel is wrestling with the problem. It has recommended that the AMA's registered care technologist proposal not be implemented in New Jersey; the MSNJ Board of Trustees agrees. The Task Force also has considered most carefully a proposal by the University of Medicine and Dentistry of New Jersey to establish a certificate program for ancillary nursing personnel, to be implemented by the Department of Nursing Education. This proposal has received approval. And the Task Force will continue to explore these and other important matters, such as scholarships for nurses and nurse-physician interpersonal relationships. We should applaud and encourage this effort.

It would be worthwhile for us to reflect on the medical aspects of nursing care. And vice versa. Even if we were to eliminate the coronary care nurse, the intensive care nurse, the nurse-midwife, the nurse-anesthetist, and others in special-care situations from consideration, the average good “floor nurse” must practice medicine in order to be effective. After all, we expect “appropriate” calls about our hospitalized patients at 2:00 A.M.; the difference between being appropriate or inappropriate certainly involves the exercising of medical judgment. Finally, we should remember why the patient is in the hospital. We may leave the orders, but the patient is there for nursing care. Same-day surgery may have removed many individuals from hospital beds, but the ones who remain require even more dedicated care by the nurses. Let us work together.

THE LOWER RESPIRATORY TRACT— More vulnerable to infection in smokers and older adults

Experience counts

Cecilor® Pulvules®
250 mg
cefactor

think of it first

For respiratory tract infections due to susceptible strains of indicated organisms.

Summary.

Consult the package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A β -hemolytic streptococci).

Contraindication: Known allergy to cephalosporins.

Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Cecilor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Cecilor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in

moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.

- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.

- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Cecilor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] and toxic epidermal necrolysis or the above skin manifestations accompanied by arthritis/arthralgia, and frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Cecilor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.

- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%, and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology

- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistest® tablets but not with Tes-Tape® (glucose enzymatic test strip, Lilly).

Bayonne Pediatrician Honored

Dr. Harold Perkel, a member of our Hudson County component, was honored as Health Care Professional of the Year.

A Bayonne physician whose 40-year practice has focused on patients with developmental disabilities was honored by the Association for Retarded Citizens/New Jersey (ARC/NJ).

Dr. Harold Perkel

Harold Perkel, M.D., received the Association's first Health Care Professional of the Year award at ARC's annual convention. Dr. Perkel began his clinical practice in pediatrics in Bayonne in 1949, the same year that the ARC incorporated in New Jersey.

The award, initiated by the Association through its special project, Mainstreaming Medical Care for Community Residents, is designed to offer recognition to those medical or dental professionals with exceptional records of providing health or dental care services for people with developmental disabilities and/or mental retardation.

Dr. Perkel has been serving the handicapped population for many years and has contributed to expanding access to primary medical care for people with developmental disabilities.

A respected lecturer on developmental disabilities, Dr. Perkel founded (in 1968) and served as its medical director until 1981 the Hudson Pre-School Class for Children with Learning Disabilities.

He was school physician in the Bayonne public school district from 1974 to 1983, where he served as coordinator of a screening program he established for all kindergarten and first-grade children for the early identification of children with learning disabilities.

Dr. Perkel was founder, coordinator, and still is medical director of the state and county funded specialized program for developmentally disabled children at Jewish Hospital and Rehabilitation Center in Jersey City.

The distinctive award was presented to Dr. Perkel before 300 convention participants by Patricia O'Donnell, ARC/NJ regional vice-president and parent of a child with Down's syndrome. She said: "His medical credentials aside ... and they are prodigious ... Dr. Perkel receives this honor for more valuable reasons. He is a pediatrician of outstanding reputation and distinction because of his exceptional diagnostic skills and because of the deep sensitivity and understanding with which he treats his patients who have developmental disabilities and their families.

"Dr. Perkel often encourages parents to reach for the stars, even as he urges them to accept their child's limitations. He is a caring professional who sets a fine example for others to emulate in treating our special populations."

In accepting the new award, Dr. Perkel suggested how all of us, working with the handicapped, would best meet the challenges ahead of us. He said: "We must identify the developmentally disabled early on; better still, we must tackle the problem of prevention. We must work with a pregnant teenager toward the prevention of prematurity and low birth weight.

"We all must have compassion and empathy in every aspect of our involvement with the handicapped.

"We must all be advocates for the handicapped, working with them, their families, their educators, their medical and para-medical professionals, and the community around them.

"Perhaps the most handicapping aspect of any disability is not necessarily the cognitive problem, the hyperactivity, or the emotional coloring, but the reaction of society to the disability and the inability of society to accept the child or the adult with his or her handicap."

PIC. It stands for Princeton Insurance Company.

And it stands for what Princeton Insurance Company is all about as well.

Protection, Innovation, and Commitment.

P

Protection

More than 5,500 of your colleagues have chosen Princeton Insurance Company for their practice-related insurance protection. Our Med-Pak Plus policy combines *Occurrence Plus* professional liability coverage with 20 other important coverages for your practice, all in one cost-effective package.

I

Innovation

Our *Occurrence Plus* policy responds to claims with your policy's limits in effect when the claim is reported, not your limit at the time the incident occurred. And *Occurrence Plus* includes an extended reporting endorsement ("tail" coverage). If you retire or relocate, you won't need to pay more for this essential protection.

C

Commitment

At Princeton, we believe we have an obligation to protect the professional reputations of our policyholders. That's the cornerstone of our defense philosophy and the reason we defend policyholders against claims which should be defended. It sounds simple, but the results are impressive — 89 percent of the cases we manage which go to court are resolved in favor of the insured.

Call your independent insurance agent to learn more about our coverages.

COMMENTARY: THE CARDIAC REHABILITATION CENTER

THEODORE H. GOLDBERG, M.D., AND MARY DAMKEN, R.N., WESTWOOD*

Cardiac rehabilitation is an important part of the total management of the cardiac patient. A hospital-based program designed to meet that need is safe and effective, and an appropriate service for a community hospital.

The Cardiac Rehabilitation Center at Pascack Valley Hospital, Westwood, was initiated in 1978, offering exclusively a phase II monitored program. Since its inception, phases I and III also have been developed. The program now includes the three basic areas of rehabilitation: phase I—inpatient—early postmyocardial infarction; phase II—telemetry monitored exercise program; and phase III—supervised, nonmonitored exercise program.

Over 476 patients have been supervised through the program, averaging 90 percent male and 10 percent female; ages ranged from 35 to 73 years with an average of 56.5 years. Statistically, patients' medical diagnoses upon entering the Center were: 49 percent s/p myocardial infarction (MI); 31 percent s/p coronary artery bypass grafting (CABG); 2 percent s/p angioplasty; and 10 percent high-risk patients.

Pascack Valley Hospital is a nonprofit, voluntary hospital with a primary service area encompassing a suburban community of 250,000. The current bed capacity is 309, with 9 coronary care unit beds, a telemetry stepdown unit, and a medical intensive care unit. The hospital does not have a catheterization laboratory, and regularly transfers patients for coronary angiography, angioplasty, and coronary bypass surgery to a tertiary care center seven miles away. The patients return to the care of their own physicians following

interventional therapy. There is, therefore, a steady flow of patients needing cardiac rehabilitation services, including postinfarction patients, postbypass and angioplasty, as well as high-risk or symptomatic patients needing exercise in a supervised setting. It is of interest, that although patterns of coronary care have changed, with many more patients receiving aggressive interventional treatment, two aspects of cardiac care remain focused in the community hospital—early acute care and late rehabilitative care.

The cardiac rehabilitation program was established as a cooperative effort with Valley Hospital in Ridgewood. This hospital, approximately five miles away, serves a similar socioeconomic population. A joint committee of the hospitals was formed to avoid the unnecessary duplication of facilities, or staff in supervising the operation of the Center. Although the staff of Valley Hospital continues to send a moderate number of referrals, the bulk of the patients are referred by the staff of Pascack Valley Hospital.

PHASE II

The patient is referred to the phase II program by

*From Pascack Valley Hospital where Dr. Goldberg is director, Department of Cardiology, and Ms. Damken is director, Center for Health and Fitness. Correspondence may be addressed to Dr. Goldberg, Westwood Cardiology Associates, P.A., 336 Westwood Avenue, Westwood, NJ 07675.

his cardiologist, primary physician, or community hospital. A patient enters the program at two to four weeks' postevent or postsurgery. During the interim, a patient may have been advised to begin an at-home walking program. A patient who is exercised in the phase II program is a potentially unstable patient. Exercise sessions are supervised by an exercise physiologist with coronary care unit nursing background and advanced cardiac life support (ACLS) training. In order to minimize liability, maximize observation, and obviate the need for direct physician presence during the exercise sessions, it was felt that telemetry monitoring should be used.

The program begins with the initial interview and consultation with the patient by the medical director (a cardiologist), and by the exercise physiologist. Patient history, exercise stress test, and electrocardiogram are reviewed and an individual exercise prescription then is determined. Realistic goals are developed further regarding exercise accomplishments, and recommendations are offered to modify lifestyle behaviors of diet, medication, smoking, and stress management.

Patient progress is reviewed by the exercise physiologist and is discussed further with the medical director and primary physician as is appropriate.

Exercise training prescriptions are developed and based upon the exercise stress test utilizing the Bruce protocol. Target heart rates are developed and adjusted accordingly for medication, fitness level, medical history, and anginal threshold history. A patient is exercised at approximately 70 to 85 percent of his maximum heart rate as demonstrated on the graded exercise test. A patient is seen four times per week for 30 to 45 minute sessions over eight weeks to equal 32 sessions. A patient is monitored continuously by telemetry, and blood pressure checks are taken during warmup, peak exercise, and cool-down phases and a patient is encouraged to subsequently check pulse and to utilize the concept of perceived exertion to modify exercise intensities for any given day.

Exercise is carried out through the various equipment utilizing circuit training. A patient is advised to build up to one 15-minute endurance bout on one chosen piece of equipment consisting of four Monarch™ bicycle ergometers, one Quinton™ treadmill, one Monarch™ arm ergometer, and two Tunturi™ rowing machines. Intervals of 5 to 10 minutes then are utilized for the duration of the session on the other equipment. Participation of the patient with all pieces of equipment also is encouraged to foster a total body workout, as well as a cardiovascular workout. The introduction of light weights (one to ten pounds) takes place in the second half of the program. Weights are utilized to increase upper body range of motion and flexibility, as well as improve strength. Light weights are encouraged with high repetitions performed. The circuit of exercise includes bicep curl, tricep extension, lateral raise and shoulder press for the deltoid muscle, butterfly extension for the pectoralis major, French curl for the tricep, and upright rowing for the total shoulder girdle.

Near the completion of the program, a patient who is not found to be at risk for dysrhythmias is removed from the telemetry monitors and is supervised further through use of pulse checks and quick rhythm checks using paddles from the Life Pak emergency unit. Workload levels are increased progressively according to patient tolerance. Patient progress is reviewed by the exercise physiologist and is discussed further with the medical director and primary physician as is appropriate. Monthly progress reports are generated for the physician as well as the patient.

All sessions are conducted in a designed room: large windows provide copious sunlight, pastel colors create a calming influence, and location of mirrors is such that a patient receives positive reinforcement of his own exercise. In addition, the room has access to a television and video cassette recorder which offer the opportunity to view educational topics on all aspects of rehabilitation. Various topics are presented that are related to benefits of aerobic exercise, risk factors, cardiovascular disease, hypertension, stress management, smoking cessation, and nutrition.

The patient is encouraged to participate in nutritional counselling by a registered dietician at the hospital and to develop new and healthful ways to implement a healthy diet; the spouse is encouraged to attend these sessions. Dietary lipid profiles are taken at the beginning and end of the program.

PHASE III

Upon completion of the phase II program, the patient is advised to continue with the newly acquired exercise routines and to meet with the exercise physiologist to update progress and new goals. The patient who continues to be at a higher risk due to poor ventricular function, dysrhythmias, or poor functional capacities is encouraged to continue exercising under supervision at the Center with the phase III program. Very often a patient without any such factors also will choose the option of continuing at the Center. The patient who does not join the phase III program is encouraged to return occasionally for a reassessment of their home-exercise program.

The 12-week phase III program consists of three sessions per week to include 5 minutes of warmup exercises (stretching, flexibility, and range of motion), 30 to 40 minutes of aerobic activity, 5 minutes of hand weights, and 5 to 10 minutes of active cool-down. Exercise prescription again is based on the factors mentioned for a phase II patient. Telemetry monitors are removed and a patient independently checks pulses and perceived exertion levels. Circuit interval training still is utilized, with the patient encouraged to increase endurance to 20 minutes on one exercise unit and shorter interval sessions of 5 to 10 minutes on the other equipment. Repetition and resistance exercise levels again are increased accordingly.

At the end of the 12-week course, exercise capacity

and cardiac performance are re-evaluated. At this point, the patient may graduate into the phase IV program which is a continuation of phase III, utilizing similar guidelines, but carried out over a prolonged period. Exercise prescriptions are reviewed, and bimonthly progress reports are generated. The patient is involved with assessment and development of new goals or reaffirmation of existing goals.

Since its inception, no incident leading to death of a patient has occurred, and no noted myocardial infarction as a result of exercise has been reported. Incidents including chest pain and hypotension have occurred. However, they too have been infrequent. The dropout rate also has been very low, approximately 10 percent. The current adherence rate is at 90 percent, with 28 percent of patients opting to continue on from phase II into phases III/IV.

SUMMARY

The Cardiac Rehabilitation Program at Pascack Valley Hospital has served 476 patients successfully over the past nine years. Although first established to serve the cardiovascular needs of the patient in a phase II program, it now includes phases I, II, and III of rehabilitation. The program includes physical reconditioning, lifestyle adjustments such as dietary modification, smoking cessation, stress management, psychological

counselling, and patient and family education. All of these efforts are designed to increase patient self-confidence, sense of well-being, and ability to function independently despite the presence of cardiac disease. Through such a program, the community hospital is able to provide services beyond the acute care setting and to offer an invaluable service of rehabilitation and education to the patient and the community.

CONCLUSIONS

1. A hospital-based cardiac rehabilitation program can meet an important community need in cardiac management.

2. The program is safe as organized.

3. Monitoring allows for another parameter of observation during the phase II program. It detects unsuspected arrhythmias, and provides an increased sense of patient security. The safety perceived by the patient enables one to progress.

4. Cooperative effort between two hospitals can reduce unnecessary duplication of facilities.

5. Although patients may be sent from our community hospital to another facility for interventional therapy, they return to the community hospital for rehabilitation. Therefore, rehabilitation remains the major responsibility of the local community hospital in the care of the cardiac patient.

MATERNAL DEATHS IN NEW JERSEY*

GERARD F. HANSEN, M.D., M.P.H., AND THOMAS A. NOONE, M.D., NEWARK**

Seventeen maternal deaths were reported in 1986. Ectopic pregnancy, AIDS, sepsis, and amniotic fluid embolism were the major causes of maternal demise. Patients' lack of obstetrical knowledge, preventing them from participating in their own care, was a significant contributing factor to maternal mortality.

The Maternal Mortality Committee, a subcommittee of the Maternal and Infant Care Committee of the Medical Society of New Jersey, in conjunction with the Maternal and Child Health Program, investigates annually all maternal deaths that occur in New Jersey. Details of each maternal death are obtained from death certificates, maternity service reports, and direct reporting from health care institutions. Such reporting is mandatory under state regulation and all information reported to the New Jersey State Department of Health regarding specific individuals and cases is held confidential and is not open to subpoena as stated in NJSA 26:1A-37(a).

Each member of the subcommittee reviews one or two cases and summarizes the circumstances of each death based on the material available. Each summary then is presented to the entire committee and consultant staff at an annual meeting at the Medical Society of New Jersey; the meeting is open to interested members of the health professions.

A decision is made by consensus as to cause of death from an obstetrical standpoint and the degree of physician and/or patient responsibility for such an occurrence. With the luxury of hindsight, recommendations are suggested as to what action, if any, could be taken to decrease maternal mortality.

RESULTS

There were 108,446 live births in New Jersey in 1986.¹ Twenty-one deaths, which occurred in or out of the hospital to women who were pregnant or had been pregnant within 90 days of death, were reported to the New Jersey State Department of Health for evaluation.

Table 1 lists the classification and mortality rates using the format suggested by the American College of Obstetricians and Gynecologists.² The remaining statistical data are summarized in Tables 2 through 5.

A nonmaternal death is defined as the death of a gravid or recently gravid woman from causes not related to the pregnancy or its management. Of the four deaths reported, two were the result of traffic acci-

dents. Both accidents were violent in nature and the use or nonuse of seat belts was immaterial. A third woman, 4 weeks postpartum, committed suicide with a revolver; this action was not related to her recent pregnancy. The fourth pregnant woman died in an accidental fall at home; no satisfactory cause of death was discovered.

An indirect maternal death is one resulting from a previously existing disease or a disease that develops during pregnancy, labor, or the puerperium which is

not directly due to obstetrical causes, but is aggravated by the physiological effects of pregnancy. There were 11 such deaths, 4 of which were deemed nonpreventable by present day standards of care.

One woman, three months pregnant, was found dead at home. An autopsy report revealed bilateral pulmonary embolism secondary to pelvic phlebotrombosis. A second woman, five months pregnant, died of viral pneumonia after a protracted hospital course. A third woman died of sickle cell crisis, 13 days after abortion and sterilization despite pre- and postoperative care. The fourth woman died of primary pulmonary hypertension following a caesarean section for cephalopelvic disproportion. Demise occurred several weeks postoperatively during evaluation at a tertiary care center.

Two women died of endocarditis during the second trimester.³ Both were intravenous drug users who failed to cooperate with their physicians. A third woman died of lobar pneumonia while six weeks pregnant; she had a history of fever, chills, and a cough for four days prior to her emergency room visit. Cardiac arrest occurred 25 minutes after admission to the emergency room. A physician factor was suggested in the death of the fourth woman who had an aortic valve replacement (porcine); antibiotic therapy was not continued for a sufficient period following a caesarean section complicated by endometritis and, subsequently, by endocarditis. A fifth woman died of sickle cell crisis at term; she refused blood transfusions based on religious beliefs. Two women died of AIDS, one after a delivery of twins in which the patient extubated herself while on a respirator; the other patient concealed delivery of a seven-month fetus in a hospital bathroom and shortly thereafter experienced cardiovascular collapse. These last two tragedies reflect the devastation of AIDS and the difficulty in caring for these patients.

A direct maternal death is an obstetrical death usually from complications of pregnancy, labor, or puerperium and from their intercessions, omissions, incorrect treatment, or a chain of events resulting from any of these complications.

Of the two deaths felt to be nonpreventable, one death was due to an amniotic fluid embolism post-caesarean section properly managed.⁴ She died 2 hours after delivery. The second patient died of a bleeding diathesis 20 hours after an amniotic fluid embolism following a spontaneous vaginal delivery.

Four potentially preventable deaths were investigated. The first death was due to the inability to effectively and efficiently intubate a patient with a retained placenta who required general anesthesia. In this instance, there was a failure to insure that the endotracheal tube was in the correct position after insertion.

One woman died of overwhelming sepsis 14 days after a second trimester abortion. Attempts by the patient to contact her primary obstetrician were unsuccessful. The patient also was seen in two separate emergency rooms but no appropriate treatment was started; on the patient's third encounter with physicians, antibiotics were prescribed.

A 17-year old black woman and a 19 year-old black woman died of ruptured ectopic pregnancies. Failure

of these women to be knowledgeable about the possibility of this serious condition was the major factor in their demise.

RECOMMENDATIONS

- 1. Human sexuality courses in high schools should include information about ectopic pregnancy and other hazards of pregnancy so that women may be meaningful participants in their care.
- 2. All physicians treating pregnant patients should be trained in emergency intubation. This includes methods of ascertaining the correct position of the endotracheal tube.
- 3. Primary physicians of pregnant women must be able to recognize and treat vigorously such medical conditions as endocarditis or to obtain competent medical consultation expeditiously.
- 4. Health care personnel must be trained to care for AIDS patients. This will require increased training as well as commitment of necessary funds and a decrease in nurse-patient ratio.
- 5. Obstetricians have an obligation to provide adequate coverage when they personally are not available to attend their patients.

SUMMARY

In 8 of the 17 maternal deaths, patient ignorance of medical facts that would have enabled them to seek medical attention was a significant factor in maternal mortality.

Sixty-five percent of maternal loss in New Jersey was due to conditions that were not of an obstetrical nature, but were medical conditions aggravated by the pregnancy.

AIDS now is an important factor in maternal and infant morbidity and mortality.

**“A big insurance company
that helps me build my practice?**

**I don't
believe it.”**

**Believe it!
Medallion.
From Blue Cross and Blue Shield.**

You told us you wanted an insurance program that can help broaden your patient base. Your patients told us they wanted more comprehensive medical coverage.

We listened. And developed Medallion. The best insurance for a healthy practice...and your patients.

Patient referral.

Our Blue Cross and Blue Shield referrals can help you build your practice. Over 40,000 prospective patients will call us this year inquiring about Blue Cross and Blue Shield participating physicians. We're eager to guide them to you because with only a minimum of out-of-pocket expense, they will receive the maximum benefits of Medallion from a participating physician.

Comprehensive fee-for-service.

Medallion compensates you for the services you render while providing comprehensive care for your patients, including office visits, well child care and unlimited laboratory and X-ray services.

Fast & simple.

Blue Cross and Blue Shield guarantees Reasonable and Customary reimbursement. Once we receive the usual claim form from you, you'll be pleased with our quick, direct payment.

More than 10,000 New Jersey physicians are benefiting from Medallion through their participation in the Blue Cross and Blue Shield network. If you're not yet a participating physician, call 1-800-842-BLUE to learn how our unique insurance program can mean a healthier, more successful practice.

The best insurance for a healthy practice.

POSTOPERATIVE EPIDURAL NARCOTICS FOR VASCULAR SURGERY

ROBERT RAGGI, M.D., ENGLEWOOD*

Benefits of epidural anesthesia for vascular surgery include: blunting of surgical stress response, decreased incidence of thromboembolism and mortality due to pulmonary emboli, less blood loss, and cardiovascular stability in the geriatric population. If the epidural catheter is used, postoperative sympathetic blockade will protect against vascular spasm and provide acute postoperative pain relief.

A recent survey of anesthesiologists indicated that an overwhelming majority (92 percent) would prefer regional anesthesia for their own surgery.¹ Regional anesthesia has become the anesthetic of choice for many surgical procedures including cataract extraction, transurethral resection of the prostate (TURP), and hand surgery.² A recent accumulation of advantageous data merits a re-examination of the benefit/risk ratio of epidural analgesia for vascular procedures (Table 1). These advantages include metabolic stability, suppression of the surgical stress response (SSR), cerebral status monitoring, stability of high-risk patients with heart diseases, hypertension, diabetes, chronic obstructive pulmonary disease (COPD), or advanced age. Epidural anesthesia affords superior postoperative pain relief. This paper will show the advantages of epidural anesthesia combined with postoperative epidural narcotics.

METHODS

Informed consent was obtained from all patients in this study. Ninety-one patients were scheduled for lower extremity vascular surgery. The limb salvage procedures included femoral-popliteal, femoral-tibial, femoral-peroneal bypass grafts, and femoral endarterectomy with vein patch.

Associated diseases included arteriosclerotic cardio-

vascular disease, COPD, diabetes mellitus (DM), congestive heart failure (CHF), hypertension, prior myocardial infarction, prior coronary artery bypass graft (CABG), ectopic beats, smoking history, chronic renal failure (CRF), ST depression on the electrocardiogram (EKG), and prior cerebrovascular accident (CVA). All patients received preoperative preparation by their internist. Preoperative medication with diazepam (0.1-0.2 mg/kg) was given orally one to two hours prior to surgery.

Monitoring included EKG (lead II and modified V5), direct arterial line blood pressure, blood gases, precordial stethoscope, verbal contact, axillary temperature, urinary catheterization, intermittent pretracheal auscultation, and Swan-Ganz monitoring when indicated (16 percent). All patients received various amounts of intravenous sedation and two to four liters of oxygen via nasal cannula. Eight patients received supplemental light general anesthesia (various combinations of intravenous neuroleptic anesthesia, nitrous oxide/oxygen 2:1 with 0.25 percent forane, and/or diazepam) for patient anxiety, positioning, comfort, and amnesia. Baseline activated clotting time (ACT) was obtained and followed by heparinization.

*Dr. Raggi is affiliated with Englewood Hospital. Correspondence may be addressed to Dr. Raggi, Director, Englewood Pain Clinic, Englewood Hospital, 350 Engle Street, Englewood, NJ 07631.

Intravenous volume loading was performed to prevent hypotension due to sympathetic block. Patients were positioned, prepped (betadine), and draped. Under sterile conditions, the most skilled anesthesiologist available administered local anesthetic skin wheal and infiltration injection at the most accessible lumbar interspace. With an 18 gauge Touhy needle, the epidural space was identified using the loss of resistance technique (LORT). After negative aspiration, a 3 ml test dose of 1.5 percent xylocaine with 1:200,000 epinephrine was injected. After three minutes, the anesthesiologist administered an anesthetic dose of 10 to 12 ml using bupivacaine 0.5 percent (84 percent) and 0.75 percent (7 percent), or xylocaine 2 percent (9 percent). A Teflon® epidural catheter was threaded, the disposable Touhy needle removed, and the catheter was secured with a sterile dressing. Further local anesthetics were given as "top-up" doses as needed through the catheter. Heparin was given intraoperatively after catheter placement.

Preservative-free morphine, 5 mg in 10 ml of sterile normal saline, was given at the conclusion of surgery (35 percent) or when the patients indicated pain (65 percent). Patients were instructed to request pain medication promptly as needed. They were monitored in the surgical intensive care unit by nurses familiar with this technique during, and 24 hours after, epidural narcotics. If the catheter was not functioning or relief was inadequate, then patients received oral or intramuscular narcotics.

RESULTS

Our series shows a zero incidence of epidural hematoma and myocardial infarction. There were five failed epidurals requiring general anesthesia. Six patients required ephedrine (5-10 mg) intravenously. No other vasopressors or afterload reducers were needed, attesting to the technique's hemodynamic stability. Postoperatively, 7 patients required diuresis for mild cardiogenic pulmonary edema. The epidural catheter was nonfunctioning in the first 24 hours in 6 patients, leaving 85 patients in the study group.

The onset of epidural morphine analgesia was consistent with other studies, i.e. 10 to 45 minutes.³ The mean analgesic duration was 15 hours, measured by requests for pain medication and nursing observation. At request for pain medication, a subsequent epidural morphine dose provided a smooth continuum of analgesia in the first 24 hours. Those patients who received epidural narcotic immediately postoperatively, within their first 16 hours, were virtually pain free. Eighty-five percent of patients received virtually complete analgesia with "top-up" doses of epidural morphine for 48 hours. Twelve patients suffered nausea and required Narcan® 7 to 10 hours postepidural morphine. Three patients vomited while receiving epidural morphine. Twenty-three patients needed Narcan® for pruritus. All patients had bladder (Foley) catheters in place so the possibility of urinary retention was not assessed. No patients had respiratory arrests (reported with higher doses of epidural morphine). Nine patients showed the side effect of respiratory rate decrease (seven to ten breaths per minute). However, with increased inspired oxygen, this was adequate ventilation not requiring naloxone reversal.

One patient suffered a subendocardial myocardial infarction three days prior to surgery requiring emergency surgery to prevent impending gangrene of his leg. He was given a combination epidural technique, had successful surgery, and did not extend his myocardial infarction.

DISCUSSION

Historically, the progress in vascular surgery and anesthetic technology has seen some parallel achievements. In 1884, Halstead performed the first neural blockade using cocaine.⁴

While performing end-to-end anastomosis and endoaneurysmorrhaphy in 1899, Dr. Rudolph Matas pioneered spinal anesthesia. He used a hypotonic solution of 10 to 20 mg of cocaine hydrochloride in distilled water.⁵ Also, utilizing the physiologic principles forwarded by Claude Bernard,⁶ René Leriche promoted surgical sympathectomy at the Strasbourg Vascular School in the late 1920s. The first reported lumbar epidural anesthetic was performed by Fidel Pages and published in the *Argentine Military Journal*.⁷ The popularization of this new technique for surgery was marked by Dogliotti's publication in Europe and in the *American Journal of Surgery* (1931).⁸ Since the beginning of this century, vascular surgery has been performed under spinal or general anesthesia, but until recently, the fear, risk, and taboo of epidural hematoma labeled epidural anesthesia as prohibitive.

VASCULAR SURGERY/EPIDURAL ANESTHESIA

There are some landmark articles that are noteworthy in the recent development of epidural anesthesia for vascular surgery.^{9,10} The classic article of Cousins and Wright demonstrated increased graft (Dacron®) blood flow after epidural sympathetic block.¹¹ Redistribution of the blood flow to the skin was achieved at the expense of the muscle. In the critical postoperative phase, vasoconstriction triggered by hypothermia and surgical manipulation may be relieved by sympathetic blockade. Distribution of blood flow to the lower extremities after epidural anesthesia has been shown to be due to decreased vascular resistance. In 1980, a review of 100 cases of abdominal aortic aneurysm repair using continuous epidural anesthesia combined with light general anesthesia, documented adequate operative conditions. No epidural hematoma nor any other anesthetic complication occurred.¹²

Epidural anesthesia has been recommended for aortofemoral aortography.¹³ It provides a motionless field for improved quality films, patient comfort, minimal cardiovascular stress, and minimum sedation. The enhanced flow to small arteries and collaterals yields superior radiographic studies. With the epidural catheter in place, these patients, supplemented by light general anesthesia, underwent vascular procedures. The authors noted rapid awakening, extubation, and no epidural hematoma. If further surgery is needed, the catheter allows reanesthetization.

Patients with coronary artery disease were given epidural anesthesia in a study that yielded dramatic results.^{14,15} Improvement in left ventricular function was demonstrated by increased left ventricular ejection fraction and improved regional cardiac wall mo-

tion. A more favorable myocardial oxygen supply/demand ratio is postulated. In experimental occlusion of the left anterior descending coronary artery, the effect of thoracic epidural was measured. The results showed a decreased size of the myocardial infarct and improved regional endocardial perfusion at the ischemic zone compared to the control group.¹⁶

In a group of 35 patients undergoing femoral-popliteal bypass, epidural anesthesia was followed by epidural morphine for postoperative pain relief.¹⁷ Five mg of morphine gave significant pain relief with no elevation of PaCO₂, or epidural hematoma. In a study of 30 patients, intrathecal morphine infusion (100 µg/hr) was given after coronary bypass surgery. The results showed effective pain relief, no epidural hematoma, minimal postoperative sedation, and early extubation (12 to 24 hours).¹⁸

METABOLIC RESPONSE

A further review of the benefits of regional anesthesia details the significant metabolic stability afforded. The most important is the blunting of the surgical stress response.^{19,20} Epidural anesthesia prepares a deafferented surgical site, which stops the nociceptive spinal excitability. In turn, this inhibits the stress elevation of the key trigger, catecholamines. Without this catecholamine explosion, there is blunting of its metabolic sequelae.²¹ Thus, the biologic signal, cyclic-AMP, which promotes cortisol and glucose elevation, is beneficially depressed. Another significant marker of blunted stress response is the lack of beta-endorphin elevation (Table 1).²²

The pituitary, renal, and adrenal hormones increase at a reduced rate under epidural anesthesia. Near normal levels of cortisol, renin, aldosterone, and growth hormone are noted with this technique.^{23,24} Elevations of plasma vasopressin (ADH) levels are reduced with epidural anesthesia.²⁵ General anesthesia depresses resting metabolic rate while epidural anesthesia does not.²⁶ The effect on pancreatic hormones tends to preserve glucose homeostasis. Hyperglycemia is further blunted by blockade of the hepatic sympathetic innervation and the adrenal medullary adrenergic release. Insulin is measurably lower during epidural anesthesia compared to general anesthesia. Diabetic patients are easier to manage by the inhibition of hepatic glycogenolysis.²⁷

Nitrogen sparing and improved postoperative nitrogen balance due to the inhibition of stress-released catabolic hormones are enhanced by epidural technique.²⁸ Immunosuppression is prevented by epidural anesthesia as manifested by the absence of lymphopenia and granulocytosis.²⁹

Various organ systems derive specific advantages during the epidural technique. The cerebral status can be monitored easily without the need for an electroencephalogram. The cardiac system enjoys improved left ventricular function, increased myocardial oxygen supply/demand ratio, less catecholamine stress, protection against hypertension after cardiac surgery, decreased mean arterial pressure (20 percent) afterload, and avoidance of the myocardial depressant effects of general anesthetics.

Studies have shown the most popular inhalation anesthetic, isoflurane, causes coronary artery steal.³⁰

TABLE 1

Benefits of Epidural Anesthesia

Endocrine
Inhibit surgical stress response
Inhibit adrenalin and cortisol release
Inhibit hyperglycemia
Inhibit lymphopenia and granulocytosis
Nitrogen sparing
Block sympathetic tone
Cardiovascular
Less myocardial oxygen demand and afterload
Decreased myocardial infarction size (experimental model)
Increased endocardial perfusion at ischemic zone
Less sympathetic blood pressure swings
Less blood loss
Less general anesthesia depressant medication needed
Redistribution of blood to lower extremities
Pulmonary
Decrease drop in FVC, FEV-1, PEFR
Less shunting, oxygen consumption
Improved A-V oxygen differences
Less pulmonary infections
Less thromboembolism
Renal
Increase blood flow renal cortex, less renal vascular constriction
Geriatric
Less cardiorespiratory trespass
Improved postoperative mental status
Miscellaneous
Earlier extubation, ambulation, and discharge
Greater postoperative pain control

*Reviews of complication cases only.

Nitrous oxide, which is used in most general techniques, has been shown to cause pulmonary hypertension which is quite detrimental to the compromised cardiac patient.

Sympathomimetic-mediated reactive swings of blood pressure are avoided with regional technique.

Blood loss has been shown to be diminished by regional anesthesia during total hip replacement (35 percent), hysterectomy (44 percent), retropubic prostatectomy (37 percent),^{31,32} and transurethral resection of the prostate (18 percent). Epidural anesthesia decreases venous capacitance and circumvents the need for positive pressure ventilation with its increased venous pressures and consequent increase in blood loss.

Pulmonary function post-thoracotomy with a light general and epidural anesthesia reveals a smaller drop in FVC and FEV-1, smaller decrease in peak expiratory flow rate, and better pain relief.³³⁻³⁵ In morbid obese patients undergoing gastropasty, epidural analgesia provides decreased intra-pulmonary shunting, decreased arterial-venous oxygen differences, and oxygen consumption.^{36,37} Pulmonary infections and total complications are decreased by 8 percent in the epidural group. Continuous technique is more protective of pulmonary function than single dose blockade.³⁸

One of the most convincing arguments for regional anesthesia is the lowered incidence of thromboembolism. When epidural anesthesia compared to general anesthesia is studied by phlebography (I-125-fibrinogen scan), there is a striking reduction of deep venous thrombosis in the femoral-popliteal (54 percent) and calf and thigh (37 percent) region. Pulmonary embolism is reduced 23 percent after hip replacement under epidural anesthesia. There are data consistent with increased blood flow, less venous stagnation in the lower extremity, less clotting, and more efficient fibrinolysis.⁴⁰ Indeed, epidural anesthesia should be added to the thromboprophylactic armamentarium for high-risk patients and procedures.

Renal sympathetics blocked with epidural anesthesia help prevent renal vascular constriction and angiotension secretion.⁴¹ This block allows greater blood flow to the renal cortex without consequent natriuresis. Indicators of proximal tubular damage (lysozyme and ligandine) never were found in urine samples of the epidural group. Creatinine clearance remained lower in this group.

The disadvantages of general anesthesia are relevant to this discussion. Regional myocardial blood flow measured by radioactive microspheres exhibit coronary vasodilatation and coronary steal in patients with coronary artery disease. General anesthetics are negative inotropic drugs.^{42,43} Nitrous oxide promotes pulmonary hypertension and limits inspired oxygen concentration. Halothane and ethrane are arrhythmogenic and depressors of the hepatorenal functions. All of the general anesthetics including the induction agents (sodium pentothal and methohexital) are potent cardiorespiratory depressants.^{44,45}

GERIATRIC AGE GROUP

Many candidates for vascular surgery are in the high-risk geriatric age group. Mortality has been shown to be greater in this group, i.e. nonagenarians (9 percent), octagenarians (5 percent). This group exhibits a generalized deterioration of organ function. By age 75, there is a 35 percent decrease in cardiac output, 20 percent decrease in cerebral blood, and 55

percent decrease in renal blood flow.^{46,47} There is a marked decrease in the elasticity and compliance of blood vessel walls, which compromises flow patterns. Pulmonary elasticity, gas exchange, arterial oxygen tension, forced expiratory volume, and total reserve are decreased significantly in this group. Drug absorption, metabolism, and excretion are decreased. Drug effect, half-life, and availability are increased. Renal function shows redistribution of blood flow towards the medulla. Frequently encountered diseases include coronary artery disease, hypertension, chronic lung disease, diabetes, and renal disease. A preoperative visit with the elderly should elicit an assessment of whether exercise tolerance is limited by shortness of breath, chest pain, or leg pain.^{48,49}

Perioperative risk in the geriatric patient has been found to correlate with pre-existing disease, ability to exercise, e.g. greater than two minutes of bicycle exercise raising heart rate above 99 beats/minute, and expected degree of surgical stress. Judicious fluid titration is imperative as these patients have an increased risk of congestive heart failure and renal dysfunction. Geriatric patients have decreased morbidity if the anesthetic regimen eliminates the deleterious cardiac effects of nitrous oxide; the result is an increase in inspired oxygen content.⁵⁰

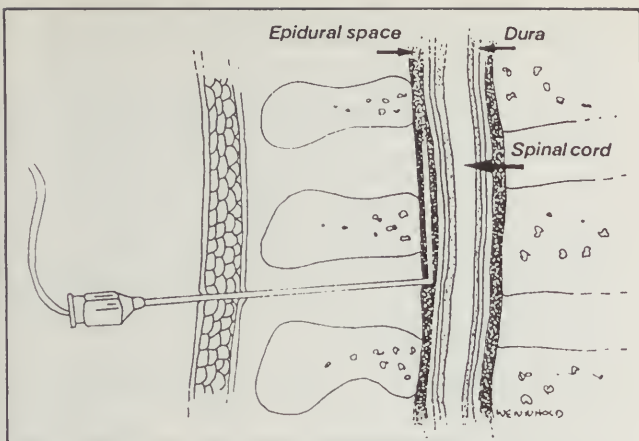

Regional anesthesia should be considered whenever possible for the geriatric patient due to its superior metabolic stability. The ophthalmologic literature is testimony to the desirability and safety of regional anesthesia in the high-risk patient population who undergo cataract surgery.

While intrathecal anesthesia provides superb somatic and motor block with minimal amounts of drug, epidural anesthesia induces a safer and more gradual onset of sympathetic blockade with better control of the risks of hypotension and bradycardia. Epidural dose is decreased with age. There is an additional benefit of decreased risk of nosocomial infection risk with ambulatory surgery which is ideal for regional techniques.

EPIDURAL HEMATOMA

The crux of this discussion hinges on whether this is a safe enough technique to merit a rethinking of traditional teaching. Recently, authors indicate this to be the case. While hematoma is not the only complication of epidurals, it is the most serious concern with its use in vascular surgery. Symptoms of urinary and/or fecal incontinence, severe low back pain, and sensory and motor deficits warn of this complication and need for urgent myelography and surgical decompression. The evaluation of the patient is improved with postoperative epidural morphine analgesia compared to epidural somatic block.

Various authors have reported cases of this devastating complication. While many of these are spontaneous, there is an increased risk in patients⁵¹⁻⁵³ with blood dyscrasias, hemophilia, leukemia, thrombocytopenia, alcoholism, anticoagulation, spinal canal neoplasm antiplatelet therapy, and difficult traumatic epidural technique.⁵⁴⁻⁵⁶ There also are neurologic deficits caused by the unrelated etiologies of spinal artery spasm, hypotension, intrathecal preservatives or detergents, and highly acidic preparations.

Figure—Postoperative epidural analgesia after peripheral vascular surgery. (Credit: Ann Wennhold)

However, the rarity of epidural hematoma is revealed in the perspective of the larger series of patients.⁵⁷ In the summation series of Dripps, Philips, Lund, and colleagues, the risk is less than .01 percent (Table 2).⁵⁸ In the more recent series of Odoom, Rao, Allen, Cunningham, and Raggi,^{59-61,63} there were no cases of epidural hematoma in the vascular surgical patients with anticoagulation therapy. This may be due to luck or a quirk of statistics. Alternatively, this may be the combination of the rarity of this risk with improved soft, atraumatic catheters, increased knowledge and skill of technique, increased monitoring and suspicion of this risk, and level of anticoagulation.⁵⁹⁻⁶¹ While the caution for epidural technique prior to anticoagulation remains, it no longer appears to be an absolute contraindication. In fact, with the emerging epidural narcotic technology, and the continued catheter and monitoring improvement, the benefit/risk ratio may be further shifted.

EPIDURAL NARCOTICS

Since the classic studies of Blume (1927) and Brooks (1937), opiates have been known to have a central nervous system receptor. In 1981, Kitahata, demonstrated a spinal avidity of opioids by iontophoretic application. This spinal opiate receptor was described by Snyder, Stoeltling, and others.^{62,63}

Wang reported the first clinical use of intrathecal morphine (1 mg) in chronic intractable malignant pain.⁶⁴ Behar reported the first clinical use of epidural morphine for acute and chronic pain.⁶⁵ Yaksh and Cousins have contributed extensive reviews which have aided understanding and stimulated research.^{62,66} In Cousins's review, epidural narcotics are cited for use in most areas including open heart surgery, thoracotomy, orthopedic surgery, abdominal surgery, chronic pain due to cancer or other conditions, and even acute medical conditions such as myocardial infarction or thrombophlebitis.

Inadequate, sporadic postoperative analgesia has continued to be a problem for modern medicine and a primary concern for patients. This is exemplified by the avalanche of clinical research trials of this new technique. Major vascular procedures, with their intrinsic high-risk geriatric and cardiac group,⁶⁷⁻⁷⁰ are a glaring omission in these early studies. This report and Allen have shown that the use of epidural nar-

cotics allows superior analgesia after vascular procedures with minimum risk.

Epidural narcotics afford selective analgesia without sympathetic sensory or motor blockade. The pharmacokinetic model proposes transport of the opioid from the epidural space to the spinal cerebrospinal fluid (CSF). This is achieved by vascular uptake via the segmental posterior radicular arteries and also by the transfer across arachnoid granulations near the dural cuff. Once in the CSF, the unionized narcotic binds to the site of action or the opiate receptor in the substantia gelatinosa of the dorsal horn. The ionized hydrophilic molecule is available for the rostral spread responsible for the side effect.

The incidence of side effects such as nausea, vomiting, pruritus, urinary retention, and respiratory depression vary with dosages and clinical study. Nausea and vomiting (17 to 50 percent) occur about eight hours after epidural morphine⁷³ and coincide with the rostral spread to the chemoreceptor trigger zone. Pruritus (28 to 100 percent) is due to histamine release three hours after epidural morphine and is severe in 1 percent of patients. Urinary retention (20 percent) is due to inhibition of the detrusor muscle. It is not a factor in catheterized vascular patients. Respiratory depression has a dual peak onset. The first refers to high plasma levels about 30 minutes after injection. The second more insidious factor is due to the cephalad spread in the CSF to the fourth ventricle 6 to 22 hours postinjection. This respiratory depression can be manifest by an increased end-tidal carbon dioxide level, a decreased ventilatory response to carbon dioxide, or apnea. This last situation necessitates the use of special monitoring by trained nurses, the intensive care unit setting, and/or apnea monitors. In addition, there have been very rare isolated cases of dysphoria, sedation,⁷⁴ and catatonia not unlike traditional narcotic overdose. All of these side effects may be treated by small doses of naloxone while preserving the analgesia. Patients with chronic high-dose treatment show tolerance to these side effects.

The effective dose⁷⁵ of epidural morphine after vascular procedures is 5 mg in 10 ml of normal saline (available in a FDA-approved preservative-free preparation). A higher dose affords equal analgesia and a higher incidence of side effects. The complete onset of epidural morphine may take 40 minutes. The duration varies from 6 to 36 hours with a mean of 15 hours.⁷⁶ Epidural sublimaze (0.1 mg) affords a quicker onset (4 to 10 minutes), less side effects, but much shorter duration (2.5 to 4 hours).^{77,78} This quick onset may be a benefit in fragile cardiac patients in acute pain. Epidural narcotics have been shown to be more effective than the technology-dependent patient controlled analgesia (PCA).^{79,80}

The excitement over this technique is easy to understand. The pain-free postoperative state can be approached if the epidural narcotic is given while the sensory block still is intact. In this way, the metabolic and other benefits of epidural anesthesia can be combined with a pain-free postoperative course in this vulnerable patient population.

SUMMARY

A series of 91 cases for peripheral arterial re-

construction managed with continuous epidural anesthesia and postoperative epidural narcotics is reviewed. The incidence of myocardial infarction, epidural hematoma, and thromboembolism was zero. Pain scores for the first ten hours show 90 percent of cases were pain free.

The postoperative sympathetic blockade improves graft flow. Added to the complete postoperative analgesia, this is shown to benefit both cardiac function and endocrine stress response.

Epidural anesthesia and postoperative epidural narcotics provide a safe and reliable method of management for patients undergoing vascular procedures.

A Little Behind In Managing Your Finances?

AMA Advisers MONEY MASTER Account...

Even if you're pretty much on top of your personal or business money management duties, there's an easier way to handle it all that can save hours of your precious free time. It's the **AMA Advisers Money Master Account**, a state-of-the-art financial management system for managing your assets, investments, savings, expenses — even your insurance! With **Money Master**, you'll discover how easy personal finance can be.

AMA Advisers Money Master Account simplifies financial management with:

- **Your Own Budget Analysis...** through the use of coded checks you'll see your monthly expenses sorted and totaled into one of 37 pre-set categories such as insurance premiums, charitable contributions, education, utilities, vacation and many more. Great for personal or professional budgeting!
- **Discount Brokerage Services...** that enable you to trade stocks, bonds, government securities, options and of course, mutual funds.
- **One Monthly Statement for ALL Your Investments.** In addition to investments made through your **AMA Advisers Money Master Account**, simply supply us with the appropriate information and for your convenience, we'll track your investments, even those made through other brokers or mutual fund organizations. All that you tell us about will be shown on your **Money Master Account** statement.

AMA ADVISERS, INC.

AMA Advisers, Inc. is a subsidiary of the American Medical Association and manages the mutual funds in The AMA Group.

Services and products as described herein are not offered for sale in any state where they are not lawfully registered.

- **Special Year-End Statement Practically Completes Your Tax Return For You!** At year end, you'll receive a statement so complete that it even shows the proper tax schedule to use for filing your return! All you do is transfer the information to the form.
- **High Money Market Returns On Your Checking Account!** You earn money market rates on all the money in your account until the day your check clears, since an AMA Money Fund Account is opened through the **Money Master Account**.

If you would like convenience of a **Money Master Account**,

CALL TOLL FREE: 1-800-AMA-FUND
Ext. 1438 TODAY! (262-3863)

Or, complete and mail the coupon. You'll receive a complete **Money Master Account** Information Kit with an application to open the one account for all your investment needs. An AMA Money Fund prospectus will be included for complete details on fees and expenses relating to the fund. Please read the prospectus carefully before you invest or send money.

CASE REPORT: MULTIPLE MYELOMA COMPLICATED BY *HAEMOPHILUS PARAINFLUENZAE* ENDOCARDITIS

MOREY MENACKER, D.O., AND RICHARD SCHER, D.O., HACKENSACK*

A patient with multiple myeloma developed Haemophilus parainfluenzae endocarditis prior to chemotherapy. Haemophilus is an uncommon cause of endocarditis, but it can infect previously normal valves. In immunodeficient patients with Haemophilus sepsis, endocarditis should be considered.

Infections are common complications of multiple myeloma, a well-described plasma cell neoplasm.^{1,5} It has been estimated that the incidence of all types of infection is 1.46 per patient-year, with the greatest period of risk during initial chemotherapy (4.86 per patient-year).⁶

Streptococcus pneumoniae is the organism classically known to be associated with infections in patients with paraproteinemias; however, gram-negative organisms are the most common bacterial isolates found.^{1,4,5} A case is described in which a patient with multiple myeloma developed an unusual infectious process prior to the initiation of chemotherapy.

CASE REPORT

A 55-year-old man was admitted to the emergency room with shortness of breath and fever. Dyspnea was episodic, but increasing in severity and duration over the four weeks prior to admission. The patient denied any significant past medical history other than smoking one pack of cigarettes daily and drinking one pint of whiskey weekly. Physical examination revealed a blood pressure of 128/80, temperature of 101°F, pulse of 120/minute and regular, and respirations of 30/minute. The cardiovascular examination revealed an S3 gallop, but no thrills, rubs, or murmurs. Bibasilar rales were heard in the lungs. The abdomen

was soft, with a liver measuring 20 cm in the mid-clavicular line.

The initial blood count revealed a hematocrit of 15.7 and a leukocyte count of 12,600 with 52 percent neutrophils, 3 percent band forms, 34 percent lymphocytes, 2 percent monocytes, 1 percent eosinophils, 1 percent atypical lymphocytes, 5 percent plasma cells, 1 percent metamyelocytes, and 1 percent myelocytes. The electrocardiogram (ECG) was interpreted as sinus tachycardia with a normal axis.

The patient was in congestive heart failure; a consideration of a hematologic malignancy was entertained on the basis of the grossly abnormal blood smear. Blood, urine, and sputum cultures were obtained to rule out sepsis. The patient was treated with diuretics and transfused packed red blood cells for congestive heart failure and anemia.

The patient improved following treatment. A bone marrow aspirate and biopsy were packed with plasma cells. Urine and serum protein electrophoresis displayed monoclonal IgG kappa spikes, and a quantitation of serum IgG was 9840 mg/dl (563 to 1765 mg/dl is normal). Blood cultures from admission grew *Haemophilus parainfluenzae*.

On the third hospital day, the patient developed a

*Drs. Menacker and Scher are affiliated with University Hospital, Newark. Correspondence may be addressed to Dr. Menacker, 6 Grand Avenue, Hackensack, NJ 07601.

blowing early diastolic murmur over the aortic area. An echocardiogram revealed a large vegetation on the aortic valve leaflet. The patient was treated for *Haemophilus* endocarditis with ampicillin. Melphalan and prednisone were initiated to treat multiple myeloma. The patient clinically improved, but succumbed to his neoplasm three months after initial diagnosis. Autopsy revealed fibrosis of the aortic non-coronary cusp without perforation. Microscopic examination failed to reveal evidence of acute infection and no pre-existing valvular abnormality was evident.

DISCUSSION

Haemophilus parainfluenzae is a well-described, uncommon cause of bacterial endocarditis. In a large series, all *Haemophilus* species accounted for only 1 percent of documented bacterial endocarditis.⁷ Lynn reviewed the literature and found 35 cases of *Haemophilus parainfluenzae* endocarditis from 1928 to 1975.⁸ The median age was 27 years, with 56 percent of infections occurring on previously normal valves. Two-thirds of the patients lacked a predisposing illness, e.g. dental manipulation, pneumonia, or respiratory infection, and no evidence of immune deficiency was noted.

Haemophilus organisms are considered normal flora of the nasopharynx and oropharynx;⁹ these are the portals of entry to the blood or lung in causing infection.

A biphasic pattern of infection in myeloma patients has been reported, with *Streptococcus pneumoniae* and *Haemophilus influenzae* occurring at presentation, and *Staphylococcus aureus* and gram-negative bacilli being reported later in the course of disease, as a major cause of death.¹⁰ Infections with polysaccharide-encapsulated organisms appear to be related to the functional hypogammaglobulinemia seen in multiple myeloma patients, as well as a poor antibody response to antigenic stimulation.^{2,4} The emergence of gram-negative bacilli as the major infectious complication in myeloma correlates well with their role as the most common nosocomial infectious agents.^{1,4,5,10}

Infective endocarditis is a diagnosis made on clinical grounds. The sine qua non for the diagnosis is positive blood cultures; however, culture negative endocarditis is a well-known entity.¹¹ The characteristic findings of heart murmur, Roth spots, Janeway lesions, and Osler nodes are helpful; absence of any or all of these findings does not rule out the diagnosis. Echocardiography, M-mode, or 2-D are valuable in documenting valvular vegetations, but lesions less than 5 mm most often are missed.¹² The diagnosis of endocarditis must be suspected in patients with septicemia without source, or evidence of one of the four major clinical manifestations: infectious process on a cardiac valve, embolization, metastatic infection, or deposition of or circulating immune complexes.¹¹

Septicemia is a common complication of multiple myeloma; endocarditis rarely is reported^{1,5,13} for two reasons: endocarditis in this setting is underdiagnosed and endocarditis is less likely to occur in patients with myeloma. This may be related to the immunologic abnormalities inherent of plasma cell dyscrasias.

The pathogenesis of infective endocarditis involves a sterile platelet-fibrin thrombus, bacteremia, and a high titer of agglutinating antibody for the infecting organism.¹⁴ The platelet-fibrin thrombus evolves at the site of previous cardiac damage. Large numbers of bacteria are required to adhere to the thrombus, and clumping of organisms by agglutinating antibodies is the mechanism involved. Endocarditis of a previously normal valve requires a more virulent strain of bacteria, and a platelet-fibrin thrombus may not be as essential. However, high titers of antibody are required to insure adequate numbers of bacteria.¹⁴

Patients with multiple myeloma are functionally hypogammaglobulinemic and, therefore, may be unable to develop sufficient bacterial clumping for valvular infection to occur.²

SUMMARY

Infectious complications with nosocomial agents are a major concern in immunodeficient patients. However, one should be aware of other polysaccharide-encapsulated organisms, such as *Streptococcus* and *Haemophilus*, infecting multiple myeloma patients during their initial presentation or clinical remission.

The diagnosis of endocarditis is rare in patients with multiple myeloma. This may be related to inappropriate antibody production seen in plasma cell neoplasms.² *Haemophilus parainfluenzae* can infect normal cardiac valves.⁸ Endocarditis should be considered in immunodeficient patients with *Haemophilus* sepsis.

CITIZEN'S AWARD: THE RIGHT QUESTION

CHUCK HARDWICK, TRENTON*

Assembly Speaker Chuck Hardwick was the recipient of the Citizen's Award from the Academy of Medicine of New Jersey. The award is presented to the citizen of New Jersey who merits recognition for distinguished service in the interest of health and welfare of the community at large.

I want to thank Dr. Paul Hirsch for nominating me for this award and for presenting it to me tonight. I have to tell you that this award means as much to me as any I have received. I value it because I value the support of those of us in public life who are trying to preserve and improve what is, after all, the best medical system on earth.

I would like to begin my remarks this evening with a story that has a point. I grew up in a small town in Kentucky, where farmers come in on Saturdays to do a little business and to catch up on the local news.

Well, one day, a stranger came to town, walked around for a bit, and then sat down on a bench next to a farmer and a dog. "Your dog bite?" he asked the farmer. "No." So the stranger reached down to pat the dog. The dog growled, bit into the man's arm, and nearly tore it off. He finally pulled himself loose from the dog's jaw, and he wailed to the farmer, "Hey, I thought you said your dog didn't bite." "Ain't my dog," said the farmer.

The point is that you have to ask the right question if you hope to get the right answer. I think we've been asking the wrong question about medical costs in this country. We've been asking: "How can we lower medical costs?"

That's not the right question. The right question is: When I'm sick, or when someone I love is sick, will we

*Assembly Speaker Chuck Hardwick (R) received the 1988 Citizen's Award from the Academy of Medicine of New Jersey. This essay was Speaker Hardwick's acceptance speech. Assemblyman Hardwick was first elected to the State Assembly in 1977 and recently was re-elected to his sixth term.

get the best possible care? From a public policy standpoint, the question is: Are the people of the state getting good medical value for their money?

This is not so unusual a question. In education, if we spend more, we are said to do a positive thing. But in medicine, if we spend more, brows furrow. Why? In education, we spend more because we believe there is a relationship between dollars and quality. But we seem perfectly willing to lower health care costs at any cost, including quality.

But, of course, the health care field is wider than hospitals. A recent survey of 14 prominent pharmaceutical companies in New Jersey showed that they employ 46,000 employees, generating sales just from New Jersey facilities of well over \$7 billion; just their research and development at New Jersey facilities total more than \$16 million.

These statistics have a story to tell about quality health care that is improving the lot of every New Jersey, even those who are not ill. We need to do everything we can to turn perceptions around. Health care dollars are not like tax dollars. State government does

not create the wealth that makes our people prosper. Health care dollars, on the other hand, stimulate the economy, creating jobs, investment, and above all, opportunity.

Though I go by the name of Chuck, my real name is Charles Leighton. As with so many of my generation, I was named after the doctor who delivered me. Not many people name their babies after trial attorneys.

We have in this country the greatest medical care in the world, or for that matter, in history. The debate about health care dollars has been asking the wrong question. When we ask the right question, we begin to see what our dollars are buying for us. And when we understand that, then we'll stop trying to make the medical profession into some kind of blue-plate special, and enjoy the medical care which, after all, is at the very foundation of what we call the American Dream.

When I'm sick, I want the best possible care—and, I firmly believe, so do the rest of the people in this great state.

Thank you and God bless you.

Kidney stones show up in some hard-to-reach places.

Luckily, the New Jersey Kidney Stone Treatment Center is easy to get to.

You shouldn't have to go out of your way for lithotripsy services to complement your practice.

The New Jersey Kidney Stone Treatment Center is centrally located in New Brunswick, New Jersey, near statewide highways, for easy access for you and your patients.

The Center is equipped with the latest Dornier HM4 "tubless" lithotripter, which eliminates the need for a water bath. That means easier patient handling, and greater patient comfort.

And the Center is located at a major academic medical center, with full medical back-up. Patients are treated on an outpatient or inpatient basis.

Any board-eligible or board-certified urologist who has completed the ESWL training course and is licensed in the State of New Jersey may apply for privileges at the Center.

Physicians may also refer their patients to the Center for treatment by a member of our medical staff. After the procedure, patients are referred back to their own urologists for follow-up care.

For a credentialing package, or for more information about lithotripsy, call Center Director Diane DiGiulio at 1-800-542-8887, 8 a.m.-5 p.m., Monday-Friday.

New Jersey Kidney Stone Treatment Center

Located at Robert Wood Johnson University Hospital
One Robert Wood Johnson Place
New Brunswick, New Jersey 08901

The New Jersey Kidney Stone Treatment Center is operated by Health Horizons, (ESWL), L.P., affiliated with the following hospitals: Community Memorial Hospital, Freehold Area Hospital, Helene Fuld Medical Center, Jersey Shore Medical Center, Raritan Bay Medical Center, Riverview Medical Center, Robert Wood Johnson University Hospital, St. Francis Medical Center, St. Peter's Medical Center, Somerset Medical Center.

AUTHOR INFORMATION

NEW JERSEY MEDICINE is the official organ of the Medical Society of New Jersey. The goals are educational and informational. All material published in NEW JERSEY MEDICINE is copyrighted by MSNJ.

CONTENT

The educational content of each issue appears as scientific articles, based on research, original concepts relative to epidemiology of disease, and treatment methodology; case reports based on unusual clinical experiences; review articles; clinical notes, succinct items on some aspect or new observation or technique of a case experience; and special articles, which include evaluations, policy and position papers, and reviews of nonscientific subjects. Other topics include commentary (critical narration); medical history; therapeutic drug information; pediatric briefs; nutrition update; and an opinion column. Editorials are prepared by the Editor and by guest contributors on timely and relevant subjects; editorials are the responsibility of the author. The Doctors' Notebook section contains organizational, informational, and administrative items from MSNJ and from the community. Letters to the Editor and book reviews are welcome and will be published as space permits. The principal aim in the preparation of a contribution should be relevance to diagnosis and treatment and to education of patients and professionals. Preference will be given to professional authors from New Jersey and to out-of-state lecturers who submit a suitable

manuscript based on a presentation made in New Jersey.

ASSIGNMENT OF COPYRIGHT

In compliance with the Copyright Revision Act of 1976 (effective January 1, 1978), a transmittal letter or a separate statement accompanying material offered to *New Jersey Medicine* must contain the following language and must be signed by all authors:

"In consideration of *New Jersey Medicine* taking action in reviewing and editing my submission, the author(s) undersigned hereby transfers, assigns, or otherwise conveys all copyright ownership to the Medical Society of New Jersey, in the event that such work is published in *New Jersey Medicine*.

SPECIFICATIONS

Submit two **manuscripts** that must be typewritten and double-spaced on 8½" by 11" paper. Statistical methods used in articles should be identified. Acknowledgements will be made only for specific preparation of an essential part of the manuscript.

Authors are asked to seek clarity, accuracy, and originality; attention to details of grammar, spelling, and typing are important.

The **title page** should include the full name, degrees, and affiliations of all authors, and the name and address of the author to whom reprint requests should be sent.

The author should submit a 40-word **abstract** to be used at the beginning of the article.

Tables must be typewritten and double-spaced on separate 8½" by 11" sheets, with a title and number. Symbols for units should be confined to column headings, and abbreviations, properly explained, should be kept to a minimum.

Illustrations should be professional quality, black-and-white glossy prints. The name of the author, figure number, and the top of the figure should be noted on a label attached to the back of each illustration. Where photographs of patients are used, the subjects should not be identifiable or publication permission, signed by the subject or responsible person, must be included with the photograph. Material taken from other publications must give credit to the

source; written permission for republication from the original publisher must be submitted. The cost of color photographs must be borne by the author.

Generic names should be used with proprietary names indicated parenthetically or as a footnote with the first use of the generic name. Proprietary names of devices should be indicated by the registration symbol—®.

The **summary** of the article should not exceed 250 words; it should contain only essential facts.

References should not exceed 35 citations except in review articles, and should be cited consecutively in the text by numbers in parentheses at the end of the sentence. The reference list should be typewritten and double-spaced on separate 8½" by 11" sheets in the numerical order in which they are first cited in the text. The style of reference is that of *Index Medicus*:

1. Goldwyn RM: Subcutaneous mastectomy. *J Med Soc NJ* 74:1050-1052, 1977.

2. Dixon WJ, Massey FJ: *Introduction to Statistical Analysis*. New York, NY, McGraw-Hill, 1969, pp. 42-48.

PUBLICATION POLICY

Receipt of each manuscript will be acknowledged and a copy delivered to the Editor who refers the paper to one or more members of the Editorial Board. The final decision is reserved for the Editor. No direct contact between the reviewers and the authors will be permitted, but authors will be informed of the reviewers' comments. The publication lag for original articles may be six months or more. Galley proofs will be submitted to the author for correction of typographical errors.

REPRINT ORDERS

Reprints may be ordered after the author is notified that the article has been selected for a specific issue of JMSNJ. A check for the cost of reprints including remake charge if order is received after due date must accompany the order.

COMMUNICATIONS

All communications should be sent to the Editor, *New Jersey Medicine*, MSNJ, 2 Princess Road, Lawrenceville, NJ 08648.

DOCTORS' NOTEBOOK

Trustees' Minutes; UMDNJ Notes; Physicians Seeking Location in New Jersey

Trustees' Minutes: October 16, 1988

A regular meeting of the Board of Trustees was held on October 16, 1988, at the Executive Offices in Lawrenceville. Detailed minutes are on file with the secretary of your county society; a summary of significant actions follows:

President's Report . . .

(1) AMA Meeting on Relative Value Scale Proposal . . . Noted that this proposed system by the Health Care Financing Administration will be discussed on November 13 and at the AMA Interim Meeting in December.

(2) NJ State Nurses Association . . . Welcomed Barbara W. Wright, R.N., executive director of the Nurses Association.

Report of Executive Director . . .

(1) MSNJ Financial Statements . . . Reviewed and approved the financial statements for the period ending September 30, 1988.

(2) Current AMA Litigation . . . Noted the following cases: (a) Missouri Supreme Court. The AMA filed an amicus brief urging the Supreme Court to uphold the decision of the circuit court; the family of a patient

in a persistent vegetative state requested permission to remove the nasogastric tube. (b) Court of Appeals, District of Columbia. The AMA joined with the American College of Obstetricians and Gynecologists in support of the appellants' position that a pregnant woman has a fundamental right to refuse medical treatment that poses a significant danger to her health. (c) Court of Appeals, Seventh Circuit. The 12-year-old antitrust suit by chiropractors against the AMA and other health care groups will be argued; the federal district court delivered a decision which found the AMA in violation of antitrust laws and the AMA was required to publish the court injunction in JAMA. The AMA has appealed. (d) Medically Unnecessary Determinations by Medicare. The AMA may challenge medically unnecessary determinations.

(4) Licensing Reform Legislation—S-2936 . . . Was informed that Mr. Maressa will notify the Board when a committee hearing is called to discuss this bill.

(5) Malpractice Surcharge Hearing . . . Noted that Drs. Formica and Riggs and Mr. Maressa will testify at the public hearing on the malpractice surcharge.

(6) Pending Appointments by Governor . . . Noted that the Executive

Committee will review all resumes and submit appropriate recommendations to the governor before October 31 for positions on the Cancer Research Committee, the Council on Medical Waste, and the State Board of Medical Examiners.

(7) Relative Value Scale Study . . . Referred the resource-based relative value scale proposal for review and report back to the Board.

UMDNJ Report . . . Noted the following items of interest from the report by Dr. Stanley Bergen: Dr. Norman Edelman has been appointed dean of the Robert Wood Johnson Medical School; and the Environmental and Occupational Health Sciences Institute is studying health problems resulting from exposure to benzene in the workplace.

NJ Hospital Association Report . . . Noted the following items of interest from the report by Louis Scibetta: (1) the problem for hospitals is staffing which translates into a need for salary increases; (2) the licensing standards for New Jersey hospitals are undergoing revision by the Department of Health; (3) the federal \$30 million grant for AZT treatment expired on September 30, 1988; (4) no evidence of favoritism alleged in the New Jersey home certificate of

CANDIDATES FOR MSNJ OFFICES

If you are interested in becoming an Officer, Trustee, or member of the AMA Delegation, a new opportunity exists for you.

The Nominating Committee will meet several times this year to consider candidates. We will consider members other than those recommended by county medical societies and nominating delegates for any of these offices.

If you wish to be considered, please contact your county medical society or the Medical Society of New Jersey for the necessary forms.

This is a real opportunity for grassroots candidate development and we urge you to use it.

need process was uncovered; (5) a New Jersey aeromedical network soon will become operational and initially the program will focus on prehospital and interhospital trauma and burn patient transfers; (6) and any refinement to the DRG system would be applauded by NJHA, particularly as it affects the reimbursement process.

Pennsylvania Blue Shield . . . Noted the informational network for Pennsylvania Blue Shield has been set up and is proceeding on schedule.

Council on Legislation . . .

(1) Current State Legislation . . .

Approved all the positions recommended by the Council, with the exception of the following: (a) A-2070—Drug Abuse (requires the Department of Health to prepare and physicians to distribute, a book-

let concerning the dangers of using cocaine during pregnancy); referred back to the Council for rewording of their reason for disapproval. (b) A-2485—Financial Interests in Referred Services (requires physicians, chiropractors, and podiatrists, when referring patients for services to a practice where they have a significant interest, to disclose that fact to the patient); position changed to active support.

(2) Certification of Review Organizations—Resolution #9 . . .

Approved the following recommendation:

That the Board of Trustees seek the introduction and passage of the legislation drafted in response to Resolution #9 of the 1988 House of Delegates.

Council on Public Relations . . .

Noted that the Council will incorporate messages on teen suicide,

depression, and panic anxiety disorders into their public service announcements.

Task Force on the Shortage of Nurses and Technical Personnel . . .

(1) Acute Care Nursing Assistant Program . . . Approved the following recommendation:

That the Society endorse the proposed Acute Care Nursing Assistant Program of the UMDNJ Department of Nursing Education and Services, and encourage the development of similar programs in New Jersey.

(2) AMA Registered Care Technologist Proposal . . .

Adopted the position that the AMA registered care technologist proposal should not be implemented in New Jersey at this time.

New Business . . .

(1) Decisions To Withdraw or

1989 MSNJ Annual Meeting

The Board of Trustees of the Medical Society of New Jersey at its September 18, 1988, meeting, approved the Committee on Annual Meeting recommendation that the 1989 Annual Meeting be held at the Sheraton Meadowlands Hotel in East Rutherford, on Thursday, April 27, through Sunday, April 30, 1989.

The daily schedule follows:

Wednesday, April 26, 1989

3:30 P.M. Board of Trustees' Meeting

Thursday, April 27, 1989

8:00 A.M. Registration Opens
8:00 A.M. Message Center Opens
10:00 A.M. House of Delegates
1:00 P.M. Program—Topic of Major Interest to Physicians
1:00 P.M. Exhibits Open
3:30 P.M. Reference Committee Meetings

Friday, April 28, 1989

8:00 A.M. Registration Opens
8:00 A.M. Message Center Opens
8:30 A.M. Exhibits Open
9:00 A.M. House of Delegates (Election)
12:00 NOON Golden Merit Award Ceremony and Reception
2:30 P.M. Reference Committee Meetings
5:00 P.M. JEMPAC Political Forum

Friday, April 28, 1989

5:45 P.M. JEMPAC Wine and Cheese Reception
6:30 P.M. Middlesex County Medical Society Reception

Saturday, April 29, 1989

8:00 A.M. Registration Opens
8:00 A.M. Message Center Opens
8:30 A.M. Exhibits Open
9:00 A.M. House of Delegates
1:30 P.M. House of Delegates
2:00 P.M. Exhibits Close
6:00 P.M. Inaugural Reception and Dinner

Sunday, April 30, 1989

8:00 A.M. Registration Opens
8:00 A.M. Message Center Opens
8:30 A.M. General Session—Topic of Major Interest to Physicians
1:00 P.M. Board of Trustees' Meeting

The daily schedule for Thursday, April 27 has been revised. Changes include the scheduling of the House of Delegates opening session at 10:00 A.M. on Thursday, April 27, 1989, and an educational program from 1:00 P.M. to 3:00 P.M., that same day.

The topics for the education programs scheduled for 1:00 P.M., Thursday, April 27, and 8:30 A.M., Sunday, April 30 will be announced at a later date.

The Inaugural Reception and Dinner-Dance honoring President-Elect Paul J. Hirsch, M.D., will be held on Saturday, April 29, 1989.

Withhold Life-Sustaining Medical Diagnosis or Treatment from Patients Age 60 and Over . . . Asked the Committee on Biomedical Ethics to review and offer an opinion on a letter from the Office of the Ombudsman for the Institutionalized Elderly concerning the mandatory reporting of adult abuse law.

(2) Tribute to Dr. Triebenbacher . . . Unanimously endorsed Dr. Hirsch's request that the editorial in the October 1988 issue of *NEW JERSEY MEDICINE* be framed and forwarded to Mrs. Triebenbacher.

UMDNJ Notes

**Stanley S. Bergen, Jr., M.D.
President**

The University of Medicine and Dentistry of New Jersey marked another milestone in its progress toward national prominence with its designation as a national "center of excellence" for environmental research.

I joined with officials of Rutgers University and the state and federal governments at our Piscataway campus to announce the Environmental and Occupational Health Sciences Institute (EOHSI)—operated jointly by UMDNJ and Rutgers—has received a \$5 million grant to create New Jersey's first National Institutes of Health (NIH) center of excellence.

The center is only the 11th in the nation designated by the NIH-National Institute of Environmental Health Sciences. Its mandate is to explore the health effects of human exposure to chemicals in the air, water, soil, and food through research in: biochemical mechanisms of toxicology and carcinogenesis; cellular mechanisms of toxicity and carcinogenesis; nutritional impact on toxicity and carcinogenesis; human exposure; and neurotoxicology.

The new center will comprise 30 scientists, including toxicologists, biologists, and chemists working on more than 50 research projects including:

- A study of how benzene is metabolized in the body, causing such diseases as anemia and leukemia.
- Research on how the liver is affected by certain hydrocarbons emitted from automobile exhausts, woodburning stoves and industrial processes.

- A project to monitor correlations between levels of a certain hydrocarbon in food, water, and air with chemical levels found in human blood and urine samples.
- An assessment of the role of nutrition in both promoting and inhibiting the development of malignant tumors.
- An exploration of how toxins affect the ability of nerve cells to transmit messages.

Since its inception in 1986, and under the expert leadership of Dr. Bernard Goldstein, EOHSI has emerged as a national pacesetter in environmental health sciences.

I'd like to spotlight two recent important appointments at our Newark campus, for they underscore our continuing commitments to science and to the communities we serve.

In the scientific realm, we welcomed an acclaimed research scientist to UMDNJ as professor and chairman of the Department of Microbiology and Molecular Genetics at the New Jersey Medical School.

Dr. Harvey Ozer's research into the effects of cell growth on cancer and aging is nationally recognized and receives ongoing support from the National Institutes of Health. A graduate of Harvard University and the Stanford Medical School, the physician-scientist joins us from City University of New York's Hunter College, where he was Thomas Hunter Professor of Science and Mathematics, a professor of biochemistry and biology in CUNY's graduate programs, and coordinator for the Center for Gene Structure and Function.

New to the position of assistant dean for minority affairs, but certainly not new to the medical school, is James Foster, a public health educator and community coordinator who has served here for two decades. During this time, Mr. Foster had spearheaded scores of community-based health care programs that have helped bring such major health problems as hypertension and childhood lead poisoning under control in Newark.

Mr. Foster, who holds a graduate degree in public administration, is concentrating on minority affairs, including student recruitment and academic and financial counseling, as well as programs for the Department of Preventive Medicine and Community Health.

**Physicians Seeking
Location in New Jersey**

The following physicians have written to the Executive Offices of MSNJ seeking information on possible opportunities for practice in New Jersey. The information listed below has been supplied by the physicians. For more information, contact the physician directly.

ANESTHESIOLOGY—Michael Silverberg, M.D., 2020 Walnut St., Apt. 29K, Philadelphia, PA 19103. Yale 1983. Board eligible. Available July 1989.

FAMILY PRACTICE—Neil S. Skolnik, M.D., 1114 Spruce St., Philadelphia, PA 19107. Emory 1984. Board certified. Group or partnership. Available.

INTERNAL MEDICINE—Diane Barton, M.D., Village of Stoney Run, Apt. 571, Maple Shade, NJ 08052. Temple 1984. Board eligible. Group, partnership, solo. Available July 1989.

Michael T. Burgio, M.D., 54 Jefferson Ave., Pompton Lakes, NJ 07442. St. George's 1985. Board eligible. Group or partnership. Available July 1989.

Rekha B. Daftary, M.D., 5 Willow Dr., Chester, NJ 07930. Kasturba (India) 1980. Board eligible. Partnership or group. Available.

Chris William Fellin, M.D., 135 Manning Terrace Apts., Danville, PA 17821. Hahnemann 1986. Board eligible. Partnership or group. Available July 1989.

NEURORADIOLOGY—Jerome G. Wiot, M.D., 803 East 6th St., #401, Newport, KY 41071. Cincinnati 1982. Board certified. Group or academic. Available July 1989.

NEUROSURGERY—Hae Dong Jho, M.D., Ph.D., 8327 Elaine Dr., Pittsburgh, PA 15237. Chonnam University 1971. Board eligible. Group, partnership, solo. Available June 1989.

OPHTHALMOLOGY—William Brian Neusidl, M.D., 200 Riverfront Pk., Apt. 13C, Detroit, MI 48226. Temple 1984. Board eligible. Available July 1989.

ORTHOPEDICS—Joseph M. Grant, M.D., Naval Hospital, Box 8, FPO, San Francisco, CA. UMDNJ 1980. Board eligible. Group or partnership. Available July 1989.

PEDIATRICS—Elizabeth Lubas, M.D., 508 Third St., Lyndhurst, NJ 07071. Boston University 1986. Board eligible. Group or partnership. Available.

Leena D. Parikh, M.D., 1290 Twin Streams Dr., Warminster, PA 18974. B.J. Medical (India) 1972. Board eligible. Group, partnership, solo. Available January 1989.

SURGERY—M. Amawi, M.D., 1904 Barham Blvd., Dodge City, KS 67801. Board certified. Group or partnership. Available.

ANESTHESIOLOGY

January

- 17 Postanesthetic Apnea in the Former Premature Infant**
6-10 P.M.—Ramada Inn, Clark (NJSSA)

CARDIOLOGY

January

- 13 Angioplasty**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (Bridgeton Hospital)
- 18 Cardiology**
10:30-11:30 A.M.—Christ Hospital, Jersey City (Christ Hospital)
- 18 Magnetic Resonance Imaging in Cardiology**
1:30-9 P.M.—Steven's Institute of Technology, Hoboken (Steven's Institute of Technology)
- 27 Thromboembolism and Thrombolytic Therapy**
7:30-8:30 A.M.—Atlantic City Medical Center, Atlantic City (AMNJ)

February

- 3 Myocardial Infarction**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (Bridgeton Hospital)
- 15 Prehospital Coronary Care**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (AMNJ)

DERMATOLOGY

January

- 10 Dermatological Society of New Jersey**
7-10 P.M.—Shering-Plough Corporation, Kenilworth (Dermatological Society of New Jersey)
- 12 Principles of Dermatologic Therapy**
1:30-2:30 P.M.—Vineland Developmental Center, Vineland (AMNJ)
- 19 Common Dermatoses**
2:30-3:30 P.M.—Ancora Psychiatric Hospital, Hammonton (AMNJ)

February

- 14 Dermatological Society of New Jersey**
7-10 P.M.—Shering-Plough Corporation, Kenilworth (Dermatological Society of New Jersey)
- 24 Update in Dermatology**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (Bridgeton Hospital)

INFECTIOUS DISEASES

January

- 11 Counseling and Testing for HIV Infection**
11:30 A.M.-12:30 P.M.—Rahway Hospital, Rahway (AMNJ and NJSDOH)
- 11 Clinical Management of HIV Infection**
1:30-2:30 P.M.—Roosevelt Hospital, Metuchen (AMNJ and NJSDOH)
- 20 Counseling and Testing for HIV Infection**
9-10 A.M.—Union Hospital, Union (AMNJ and NJSDOH)
- 25 Counseling and Testing for HIV Infection**
1:30-2:30 P.M.—Roosevelt Hospital, Metuchen (AMNJ and NJSDOH)

February

- 1 Clinical Management of HIV Infection**
9-10 A.M.—Somerset Medical Center, Somerville (AMNJ and NJSDOH)
- 2 Clinical Management of HIV Infection**
2:30-3:30 P.M.—Greystone Park Psychiatric Hospital, Greystone Park (AMNJ and NJSDOH)
- 2 Clinical Management of HIV Infection**
1:30-2:30 P.M.—Vineland Developmental Center, Vineland (AMNJ and NJSDOH)
- 7 Clinical Management of HIV Infection**
11-12 noon—Hunterdon Developmental Center, Clinton (AMNJ and NJSDOH)
- 8 Counseling and Testing for HIV Infection**

11:30 A.M.-12:30 P.M.—Hamilton Hospital, Trenton (AMNJ and NJSDOH)

MEDICINE

January

- 3 Seizure Disorders**
7-8 P.M.—West Hudson Hospital, Kearny (West Hudson Hospital)
- 11 Chronic Pain Management and Issues Related to Iatrogenic Addiction**
10:30-11:30 A.M.—St. Mary's Hospital, Passaic (AMNJ)
- 17 Arthritis**
10-11 A.M.—Green Brook Regional Center, Green Brook (AMNJ)
- 18 Migraine Headaches**
1-2 P.M.—West Hudson Hospital, Kearny (West Hudson Hospital)
- 20 Update in Arthritis**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (Bridgeton Hospital)
- 24 Management of Abdominal Emergencies**
11 A.M.-12 noon—Hunterdon Developmental Center, Clinton (AMNJ)
- 25 Hypertension**
10:30-11:30 A.M.—Christ Hospital, Jersey City (Christ Hospital)
- 26 Visiting Professor Program**
1:30-5 P.M.—Saint Barnabas Medical Center, Livingston (Saint Barnabas Medical Center)
- 27 Pain Management in Geriatrics**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (Bridgeton Hospital)

February

- 1 Medical and Psychiatric Aspects of Drug and Alcohol Abuse**
1:30-2:30 P.M.—Essex County Hospital Center, Cedar Grove (AMNJ)
- 3- Drugs for the 90s for All**
- 5 Specialties: An Update on Drug Therapy**
Colony Beach Resort, Long Boat Key, Florida (American College of Clinical Pharmacology, NJ Section)
- 15 Medical Lecture Series**
- 22 10:30-11:30 A.M.—Christ Hospital, Jersey City (Christ Hospital)**
- 16 Management of Chronic Air Flow Limitations**
12 noon-1 P.M.—Somerset Medical Center, Somerville (Somerset Medical Center)
- 17 Anorexia and Bulimia**
12 noon-1 P.M.—Bridgeton Hospital, Bridgeton (Bridgeton Hospital)
- 22 Proper Use of Endoscopy**
10:30-11:30 A.M.—Christ Hospital, Jersey City (AMNJ)

The Academy of Medicine
of New Jersey—
in cooperation with

UMDNJ—Robert Wood Johnson Medical School
& Robert Wood Johnson University Hospital

present

**AN INTENSIVE REVIEW
OF INTERNAL MEDICINE**

January 18, 1989-May 31, 1989

4:00 P.M.-7:00 P.M.

at

**ROBERT WOOD JOHNSON UNIVERSITY HOSPITAL
NEW BRUNSWICK, NEW JERSEY**

The course is designed to provide a comprehensive review of contemporary concepts in Internal Medicine. It is designed for practicing internists and family practitioners. The review will also be useful for residents. Syllabus material will be distributed during the course which will, when compiled, provide an extremely useful reference.

COURSE CHAIRMAN: Robert Eisinger, M.D.

(AMNJ)
- 22 Urology Meeting**
6:30-9:30 P.M.—Holiday Inn, Monroe
(Urology Society and Urology Section, AMNJ)

MSNJ ANNUAL MEETING APRIL 27, 1989—APRIL 30, 1989

LETTER TO THE EDITOR

Surcharge Plan

Dear Dr. Slobodien:

I wish to reveal my concern with the expressed intent of the Medical Society of New Jersey to fight the surcharge plan of the insurance commissioner on "all fronts: regulatory, legal, and legislative."¹ In taking this extreme position, MSNJ is working actively against the interests of perhaps one third of its membership: those who are not insured with the Medical Inter-Insurance Exchange of New Jersey, which entity, by the way, has no legal connection with the Society. MSNJ may well win a pyrrhic victory in this matter if it succeeds in saddling a portion of its membership with an excessive assessment to pay for insurance purchased, in the main,

from a broker, Britton Agency, which was the Society's recommended broker for many years. I fear that members who recognize that the Society is acting in a fashion prejudicial to their interests might resign their membership, and rightly so, since the Society should not serve one portion of its membership while actively attacking the interests of others. Some way should be found to reconcile the interests of members who have bought various insurances in good faith. I might add the assertion that members who did not buy insurance from MIIENJ bought "bargain insurance"² is unfounded, as the rates at the time MIIENJ came into existence were quite similar. Dr. Carnes, in his farewell address, spoke of the need to increase membership as his number one priority. He also stressed the need for unity and the need to speak and negotiate as one voice. Dr. Formica, in her inaugural address, spoke about the potential for division and described the Society as an organization which binds us all together and acts as our advocate.³

It is my opinion that MSNJ's position on the surcharge is divisive, will serve to decrease membership, will be perceived by a large group of the membership as hostile to their interests, and will result in an image of MSNJ as an organization too closely tied to the interests of an insurance company which it may have assisted at its birth, but which is now a separate legal entity.

It is my hope that MSNJ will take a fresh look at its position on the surcharge and act as the representative of all of its membership rather than just a portion, majority though it may be, which is favored because of its status as a customer of MIIENJ.

(signed) Joel F. Lehrer, M.D.

3. Formica PE: Inaugural address. *J Med Soc NJ* 85:489-490, 1988.

Editor's reply: It is unfortunate that Dr. Lehrer does not recognize the basic unfairness in the surcharge plan of the commissioner of insurance. Most will remember that the Medical Society of New Jersey established the Medical Inter-Insurance Exchange of New Jersey (MIIENJ) for the benefit of its members and other physicians in the state of New Jersey.

Those of us who helped get MIIENJ off the ground put in heavy amounts in subordinated loan certificates to provide adequate initial capitalization. In addition, we have continued to pay premiums that have been sufficient to mainstream the company in a solid financial condition.

Contrast the contributions of those who participated in the New Jersey Medical Malpractice Reinsurance Association. There was no upfront money and the premiums have been actuarially insufficient through the years, despite warnings given the Association. If those insured by the Association had contributed in a similar way to those who contributed to the Exchange, there would be no shortage. If the term "bargain insurance" is not appropriate, why were those who signed with the Association warned that they might be surcharged in the future?

The situation reminds me of the oil filter commercial, "You can pay me now or you can pay me later." Those of us who supported MIIENJ have done the paying. Those of you who didn't want to pay then, can pay now. The vast majority of MSNJ members agree with this. They also feel that any other position would be totally unfair and would reward fiscal irresponsibility. We are hopeful that justice will prevail.

Ambulatory Pediatric Care; Arthritis in Black and White; Atlas of Clinical Dermatology

Ambulatory Pediatric Care

Robert A. Dershewitz, M.D., (ed). Philadelphia, PA, J.B. Lippincott Company, 1988. Pp. 944. (\$49.50)

For the student, resident, or young practitioner providing primary care for children and adolescents, *Ambulatory Pediatric Care* is a handy and easy-to-use text. The subject matter is covered in great detail.

The editor lived up to his promise to discuss over 99 percent of the office problems seen in a pediatric practice. The chapters, written by different authors, have been edited, to some degree of consistency. The book provides an accessible approach to problems; most problems are provided with a brief or even more extended discussion.

This text is an excellent place to begin a search for information. In addition to the various health-related topics, there are chapters on practice management, including reference to financial and administrative concerns.

There are, of course, disadvantages to this comprehensive approach. Many of the chapter authors provided limited information. Some

authors made up for this with useful references, helpful tables, or short algorithms; others simply skimmed or had incomplete information; and others wrote vague generalities. It is regrettable that the editor could not keep in closer touch with individual authors. A number of the chapters should be rewritten in a second edition with more useful summaries and tables for better references. In some chapters, the jargon should be deleted and the writing could be improved significantly.

As with any large text, one always can find specific areas to disagree with or to praise. I thought the chapter on otitis media was quite worthwhile.

The chapter on sleep disorders was sadly lacking, making no mention of the importance of how a child is put to sleep in determining what will happen later in the night. Nothing was said about the course of normal sleep. This author gave six references to his own articles. He would have done better to skip them all and mention Ferber's book on sleep disorders in childhood.

In summary, the book will be of great help to a junior. It lacks the depth required by an experienced practitioner. It is a quick approach to a problem, but not a detailed guide to management or study.

Avrum L. Katcher, M.D.

Arthritis in Black and White

Anne C. Brower, M.D. Philadelphia, PA, W.B. Saunders Co., 1988.

The author, a former professor of radiology and orthopaedic surgery, has skillfully blended her knowledge of both disciplines to create a book of great merit and joy.

The appellation, "black and white," simply refers to arthritis as visualized on radiographs. The book is intended for the general radiologist, family practitioner, internist, and rheumatologist. In many ways, the excellent organization and clear presentation of the clinical-radiologic material within this slim volume remind this reviewer of the combined benefits of a dictionary and thesaurus to students of English.

The contents of the book are unified by two major approaches to radiodiagnosis of joint disease: radiographic changes observed in

a specific joint, and radiographic changes observed in a specific articular disease.

A description of the hallmarks of common joint diseases in conjunction with these two approaches are used by Dr. Brower in revealing the appropriate diagnosis.

The radiographic reproductions are large, show fine detail, and have been selected with expertise.

Despite the availability of advanced imaging techniques such as nuclear medicine, computerized tomography, and nuclear magnetic resonance, radiography should continue to remain the primary diagnostic modality of most arthropathies in the foreseeable future.

Lloyd N. Spindell, M.D.

Atlas of Clinical Dermatology

Anthony duVivier, M.D. Philadelphia, PA, W.B. Saunders, 1988. (\$145)

This book is an interesting mixture of beautiful clinical and histopathological photographs of a wide variety of skin problems. Unfortunately, the sparkling graphics are supported by a too brief, personally biased text, and no references or bibliography. It will be of limited use to a nondermatologist.

The chapters are chaotically organized by morphology, e.g. blistering disorders; etiology, e.g. fungal infections, infestations; diagnosis, e.g. psoriasis, eczema; systems, e.g. disorders of pigmentation, disorders of circulation; and anatomy, e.g. disorders of the sebaceous, sweat, and apocrine glands. Since conditions which look alike cross these artificial separations, the user must have a very good idea of the diagnosis, or be hopelessly lost. The index is keyed to the numbered photographs, rather than pages and, therefore, is quite unhandy.

What to do with this coffee-table-sized, expensive folio of beautiful photographs? Dermatologists, with their students and residents, can refer to it to see representative, classical depictions of disorders, as they rarely appear in the clinical setting. The pathology micrographs and discussions will be appreciated, and the terse therapeutic suggestions will be debated, expanded, and updated.

Christopher M. Papa, M.D.

**Drs. Cloud; Ciccone;
Cordner; Flessa; Hahn;
Hawkes; Holland; Jacobs;
Kim; Madaras; MacDonald;
McIntosh; Ristine; Terkecky;
Traganza; Wilson**

Dr. Albert W. Cloud

Retired surgeon, Albert Williams, M.D., died on July 22, 1988, in Englewood. Born in 1900, Dr. Williams received his medical degree from Harvard in 1925. He was chief of surgery and chief of medical services. Dr. Williams was a member of our Bergen County component and of the American Medical Association. He was a fellow of the American College of Surgeons.

Dr. Roy C. Ciccone

Orthopaedic surgeon Roy R. Ciccone, M.D., died on July 13, 1988, at the age of 76. Born in Nutley, Dr. Ciccone was graduated from New York University School of Medicine in 1935. He was affiliated with General Hospital Center, Newark Beth Israel Medical Center, and St. Mary's Hospital, all in Newark, and The Hospital Center at Orange. A diplomate in orthopaedic surgery and a fellow of the American College of Surgeons, Dr. Ciccone was a member of our Passaic County component, of the American Medical Association, and of the New Jersey Orthopaedic Society. Dr. Ciccone received the Army commendation ribbon for his outstanding contributions in orthopaedic surgery, after designing a special paratrooper boot to prevent foot injuries.

Dr. Harold Cordner, Jr.

Harold Joseph Cordner, Jr., M.D., an anesthesiologist, died on July 25, 1988. Dr. Cordner was senior attending anesthesiologist and associate director of anesthesiology for Hackensack Medical Center. A 1953 graduate of Georgetown University School of Medicine, Washington, D.C., Dr. Cordner served his residency at Columbia Presbyterian Hospital, New York, where he was appointed attending anesthesiologist in 1959. Dr. Cordner was a member of our Bergen County component and of the American Medical Association. He was a diplomate of the American Board of Anesthesiology. Dr. Cordner designed the Cordner cannula, an instrument used by anesthesiologists. A captain in the Air Force, Dr. Cordner served as chief of anesthesia at the Air Force Hospital in Lake Charles.

Dr. Demetrios Flessa

A member of our Passaic County component, Demetrios Flessa, M.D., died on July 16, 1988, at the age of 66. He practiced for 46 years in Garfield; his wife, Eugenia Flessa, M.D., is a radiologist in Hudson County. Born in Argos, Greece, he emigrated to the United States in 1953. Dr. Flessa was affiliated with Jersey City Medical Center, General Hospital Center at Passaic, and St. Mary's Hospital, Passaic. He was a fellow of the American College of Surgeons and KRIKOS, an organization for Greek physicians.

Dr. Katherine B. Hahn

Katherine Burnet Hahn, M.D., an emeritus member of our Society, died on July 25, 1988. Born in 1898, Dr. Burnet received her medical degree from Cornell University Medical College, New York, in 1926. She was a member of our Essex County component and of the American Medical Association. She retired from practice in 1960.

Dr. Stuart Z. Hawkes

A retired member of our Essex County component, Stuart Zeh Hawkes, M.D., died in March 1988. Born in 1905, Dr. Hawkes received his medical degree from Johns Hopkins in 1930 and completed an internship at Newark City Hospital in 1932. He was a diplomate of the

American Board of Surgery, a member of the American Medical Association, and a fellow of the American College of Surgeons. During his lengthy career, Dr. Hawkes was affiliated with United Hospitals of Newark where he was medical director. He was a vice-president of the Academy of Medicine of New Jersey and was a past president of the Essex County Medical Society.

Dr. A.H. Holland, Jr.

Retired since 1974, Albert Harold Holland, Jr., M.D., died on June 13, 1988, at the age of 69. A 1944 graduate of New York University School of Medicine, Dr. Holland was director of the Office of Research and Medicine for the Oak Ridge, Tennessee, operations of the Atomic Energy Commission. From 1954 to 1959, he was medical director of the Food and Drug Administration, and was vice-president of American Home Products Corporation from 1960 until his retirement in 1974. Dr. Holland was a member of our Morris County component and of the AMA.

Dr. Alan L. Jacobs

General surgeon Alan Lawrence Jacobs, M.D., died on July 8, 1988, at the age of 79. A New York native, Dr. Jacobs received his medical degree at Cornell University Medical College in 1932. A diplomate in surgery and a member of our Union County component and of the American Medical Association, Dr. Jacobs was affiliated with Overlook Hospital, Summit, and Newark Beth Israel Medical Center.

Dr. Woo H. Kim

Born in 1940 in Seoul, Korea, Woo Hyuck Kim, M.D., died on May 10, 1988. Dr. Kim received his medical degree from Korea University in 1968. In 1977, he received his license to practice in New Jersey and was affiliated with Atlantic City Medical Center, West Jersey Hospital, Camden, and Walson Army Hospital, Fort Dix. He was a staff physician for the Woodbine State School. Dr. Kim was a member of our Ocean County component and of the American Medical Association.

Dr. John S. Madaras

John Stephen Madaras, M.D., 88, died on July 24, 1988. A native of

Bayonne, Dr. Madaras received his medical degree from the Georgetown University School of Medicine, Washington, D.C., in 1924. A member of the American Medical Association and of our Hudson County component, Dr. Madaras was a fellow of the American and International Colleges of Surgeons. He was affiliated with Bayonne Hospital, and practiced for almost 50 years in Bayonne.

Dr. Edward O. MacDonald

Retired general surgeon, Edward Owen MacDonald, M.D., 73, died on April 21, 1988, in Florida. A native New Yorker, Dr. MacDonald received his medical degree from Long Island College of Medicine, Brooklyn, in 1939. For 20 years he maintained a private practice in Roselle, specializing in surgery. Dr. MacDonald began an affiliation with St. Elizabeth Hospital as a clinical assistant in the Department of Surgery, becoming chief of staff in 1963, chief of the Department of Surgery, and director of medical education in 1969. He also was affiliated with Alexian Brothers Hospital and served as a clinical instructor of surgery at UMDNJ. A fellow of the International College of Surgeons, Dr. MacDonald was a member of our Union County component and of the American Medical Association.

Dr. Charles C. McIntosh

After 28 years of medical practice, family physician Charles Crawford McIntosh, M.D., 60, died on July 8, 1988. A native of West Virginia, Dr. McIntosh received his medical degree from New York Medical College in 1960. In addition to his private practice in Teaneck, Dr. McIntosh established an affiliation with Holy Name Hospital and was a member of our Bergen County component.

Dr. Edwin R. Ristine

Edwin Russell Ristine, M.D., retired member of our Camden County component, died on July 12, 1988. Born in 1906, Dr. Ristine graduated from University of Pennsylvania in 1929. Dr. Ristine was a member of the American Medical Association and a fellow of the American College of Surgeons. He was affiliated with Cooper Hospital, Camden, as chief of surgery, and Lakeland Hospital, Grenloch. He served as a lieutenant in the Army Medical Corps from 1942 to 1946.

Dr. Mykola Terkecky

Word has been received of the death of Mykola Terkecky, M.D., on April 6, 1988. Born in 1891 in Poland, he received his medical degree from Crakow University, Poland, in

1918. A family practitioner, Dr. Terkecky was affiliated with St. James Hospital, Newark. He was a member of our Essex County component and of the AMA.

Dr. Robert W. Traganza

Specializing in ophthalmology, Robert William Traganza, M.D., died in June 1988, at the age of 80. A native of Philadelphia, Dr. Traganza attended Hahnemann Medical College and received his medical degree in 1933. A diplomate in ophthalmology, Dr. Traganza was a member of our Camden County component and of the American Medical Association. He served as a surgeon at Wills Eye Hospital, Philadelphia. During World War II, he was a captain in the United States Army Medical Corps.

Dr. Lester R. Wilson

A member of our Camden County component, Lester Ramon Wilson, M.D., died on July 5, 1988, at the age of 88. Dr. Wilson was graduated from Jefferson Medical College, Philadelphia, in 1924, and was affiliated as a senior attending in surgery at Cooper Hospital, Camden. A member of the American Medical Association, Dr. Wilson was a fellow of the American College of Surgeons. From 1925 to 1946, Dr. Wilson served as a colonel in the U.S. Army.

YOU CAN KEEP THEM IN BALANCE— YOUR FAMILY LIFE AND YOUR MEDICAL PRACTICE.

We'd like to help you spend more time with your family yet receive professional satisfaction from your medical practice. As a member of the Air Force health care team, you'll be able to participate in our group practice concept which will free you of most administrative duties. Air Force benefits are also very attractive. You and your family will enjoy 30 days of vacation with pay each year plus many more Air Force advantages. Call

ASSOCIATE DIRECTOR CLINICAL DEVELOPMENT

Merck Sharp & Dohme a research-oriented pharmaceutical manufacturer located 25 miles northwest of Philadelphia, is currently accepting applications for the position of Associate Director, Clinical Development.

The major responsibilities of this position include the design, implementation, and monitoring of clinical studies involving MSD marketed drugs. The review of study data is also a major responsibility of this position.

Excellent interpersonal skills are essential as this position involves considerable contact with academic physicians and other health care professionals. Applicants must also exhibit a high degree of proficiency in written communications. In addition, the position involves ancillary duties in the Medical Services Area. Approximately 50% domestic travel is required. Travel scheduling and planning are flexible.

Applicants must have a medical degree and should have completed an internship and residency. Board eligibility or certification in Internal Medicine, Cardiology, Gastroenterology, or Infectious Diseases, and medical practice and/or industry experience are desirable.

For confidential consideration, please forward your resume to:

Russell M. Shaner

STAFF PSYCHIATRIST

Tired of breathing polluted air? Irritated at having to pay private school tuition in addition to taxes for your children's education? Weary of spending two hours a day commuting? Unhappy having to triple lock your doors and still be concerned for your family's safety? Then strongly consider moving to Knoxville, Iowa. Contemporary hospital based psychiatry with friendly colleagues who keep up with their medical fields. All the advantages of working for VAMC with paid vacation, sick leave, reasonable workload, appreciative patients and staff. Day Care Center on station available to VAMC working parents. (You may have lunch with your child.) Iowa Public High School students consistently score higher than other 49 states on S.A.T.'s. All cultural opportunities available in Chicago or Minneapolis (4-5 hours by car). Knoxville is a friendly, up-to-date town with contemporary stores. Des Moines (state capital) is less than one hour away by car. If you think this is too good to be true, call Dr. Lynn Huebler, 515-842-3101, Ext. 6003, and arrange to visit for an interview.

Equal Opportunity Employer.

Urologist Private Practice Opportunity

Excellent opportunity for a Board Eligible/Board Certified Urologist to join a busy private group practice in the Mid-Atlantic Region. The Practice serves a growing community supported by a 500+ bed tertiary-care hospital. The contemporary office setting, located just five minutes from the hospital, is part of a newly built Medical Center and provides a supportive medical and administrative staff. Salary plus percentage compensation arrangement. Send CV to Box No. 292 c/o NEW JERSEY MEDICINE, 370 Morris Avenue, Trenton, NJ 08611.

"SELLING PRACTICES IS OUR BUSINESS"

Want to maximize the return on your investment? Before you buy or sell, call for an appraisal to assure the best financial and transfer terms. We are a full service practice broker, not simply a listing service. Since 1981, Countrywide has been instrumental in helping hundreds of doctors like yourself buy and sell their practices. We guide you through the entire sales process from initial meeting to closing. Our offices serve New Jersey, New York and New England.
